While it is a little early to report fully upon the Clover crops, but so far as information has come to hand, the crop of Sainfoin in France is said to be an entire failure, while the yield is good in Moravia and Hungary. Trefoil appears everywhere to have failed. Fine samples of white Clover have come in from Bohemia and Moravia, but no positive knowledge as to the probable extent of the crops. Of Alsike Clover, the German produce is insignificant, but reports from America are favourable. The crop of *Trifolium incarnatum* in Italy being better than was expected, prices are beginning to decline. In reference to red Clover, it may be said that in July and the beginning of August the prospect of the yield in the United States was very favourable, and prices have become slightly reduced. The yield in both Bohemia and Hungary, at one time appearing to be small, has greatly improved, and Alsace, the Palatinate, and other Rhenish districts, promise, contrary to former expectations, a pretty fair yield. There is an improvement in the prospects of the yield of Lucerne.

ELECTRIC ILLUMINATION AND VEGETATION.

At a recent meeting of the Physical Society of Geneva, a paper was read by Professor R. Chodat on the "Action of Electric Light on Vegetation." At the commencement, the Professor said that several observers had noticed the beneficial effect atmospheric electricity had on vegetation. Nollet declared that electricity favourably influences the germination of seeds. Many thought researches on this subject a waste of time, but the results obtained by patient investigation were too important to be ignored.

To find out whether germination was really quicker in plants under the influence of electricity, the Professor made the following experiment:—A certain number of Bean seeds were placed in water until the roots became visible. Fourteen seeds in all were used; they were divided into two lots, each of these being identically the same as regards weight, size, and appearance. Each lot was placed in a tub containing sawdust, and each was regularly watered, while the conditions of heat and light for each were identical. One of the tubs was then placed in communication with a Holtz machine, and was electrified, the first day for 40 minutes, the second for 2½ hours, the third day 3½ hours, the fifth day for 4 hours, and the following days for 3 hours, up to the eleventh day. On the fourth day the leaves began to appear in the electrified tub, while no sign of a leaf was apparent in the other. On the fifth day the difference was still more marked, for the leaves and stems began to take an upright position, though no activity was manifest in the second tub. On the seventh day the non-electrified seeds began to put forth buds. This experiment confirms the opinion which attributes to electricity some action in forcing the germination of the seed, and in quickening its development.

A second series of experiments was conducted to ascertain the influence of electricity on the Oxalis. Some specimens of this plant were placed in con-

nection with the electrical machine, while some others were placed away from it. When the former lot had been electrified, they were covered with a wooden box, which completely shut out the light. The second lot was covered in like manner. At the end of twenty minutes the two pots were examined; the electrified Oxalis had kept their normal position, while the other plants were in a drooping condition. The same effect has been tried on this plant at the end of the day. When twilight came on, one pot was electrified, while the other was not. Soon the difference became apparent, for the plants in the first pot remained awake till long after the other had closed its buds. It is an interesting fact that the sensitive plant is not affected by these electrical influences.

This, then, is the substance of the Professor's interesting paper, which should attract the attention of all those interested in the subject of the application of electricity to the vegetable kingdom. H. C. F.

REARING OF CITRUS AND DECIDUOUS TREES FROM SEED.

(Continued from p. 151.)

THE OLIVE.—The propagation of the Olive from seeds is perhaps the most difficult, for various reasons. The pits [seeds] are quite hard, and sometimes require two years after sowing to germinate. In Italy, the growers soak the pits in a potash solution for two or three days, and it is said that when thus treated they germinate the same year in which they are sown. The practice in California is to reproduce from cuttings, and no particular attention has been paid to raising the plants from seed. It is claimed by French and Italian authors that raising the plants from seed is the most natural system, and the one producing the most healthy and robust plants; but they admit that trees grown in this way require more time to bear fruit than those propagated from cuttings. Trees grown from seed seldom produce fruit in less than eight years, and furthermore, they must be budded or grafted, and they must be at least four or five years old before this operation can be performed.

The majority of the pits of the Mission Olive do not contain kernels, therefore it is advisable to use those from any other variety having kernels. It is not necessary that the Olive (from which the pits are taken) be one of those possessing high qualities for pickles or oil, but it is important that the tree be of a thrifty sort. The fruits of the Redding Picholine contain perfect kernels, but the tree being a poor grower, it is not advisable to use this seed, as they may produce plants of a still smaller habit. The seeds having been freed from the pulp, are washed in water—containing some lye or ashes—to free them of the oil adhering to them; they are then washed in clear water, and after drying in the shade are mixed with sand and put into boxes, to be kept till the following spring and then planted. The sowing is done in February or March. The use of lye is necessary to render the shell of the pit a little less compact, in order that they may be penetrated by moisture. The lye roughens the shell, and thus gives access to humidity.

As Olive seeds do not all germinate the first year of sowing, it is advisable not to destroy the seed-bed until the end of the third year. The pits often continue to germinate in certain quantities for over two years.

The pits may be advantageously split, not by using a hammer, but always an iron vice. The longer part of the pit is placed between the jaws of the vice, and by closing tightly the screw, the shell is split. It is not necessary to take out the kernel; on the contrary, it is better to leave it in the cracked shell.

The seeds are planted in March in ordinary seed-boxes, with the bottoms perforated to admit of good drainage. The box is then filled with fine sandy loam to within 3 inches of the top, then half an inch of sand, and on top of this the kernels are spread, and covered with 2 inches of sand.

The boxes should be kept moist, and shaded for awhile. This method obviates the necessity of soaking the pits in lye, to deprive them of their oily coverings, and a person can easily obtain some 600 or more kernels in a day. The plants are left to grow two years in the seed-beds or boxes; they can then be transplanted in the nursery, and when large enough can be budded or grafted.

ORANGE.

The Orange is very easily propagated from seed. For this purpose, windfalls, "culls," &c., are used, but should be thoroughly ripe. The fruit is put into barrels to rot, and the seed is washed out. A coarse sieve is used, the decayed pulp passing through the wire, leaving only the seed in the sieve. The seed should not be allowed to get dry after being taken from the fruit, and as soon as possible after being separated from the pulp should either be sown, or mixed with sand and kept in boxes in readiness for planting. The seed can be sown in boxes or in seed-beds, which should be well prepared with fine soil or mould. It is planted thickly and broadcast, and covered with fine earth from 1 to 2 inches. The best time to plant Orange seed is in March and April. If planted before March they have to remain in the damp cold ground till the time of germination, and many decay. Orange seeds do not germinate until spring; it is better, therefore, to plant the seed when the ground becomes warm, and all danger of frosts is over. The seed-beds should be kept moist, but not too wet. The season following, the plants are transplanted in the nursery. The plants are taken up and assorted into sizes; the larger ones are planted, and the small and slender ones are set in shallow boxes, and kept another year—they being small, quite slender, and very delicate, are scorched by the sun when planted in the open ground. The plants are set in the rows 12 to 18 inches apart, and the rows 6 feet apart; this gives ample room for cultivation, and for balling the trees when digging them, when the time for transplanting to orchard comes. Planting close in the nursery tends to make slender trees. After the plants have grown a year in the nursery they may be trimmed, provided they have made good growth, say, in February, and left to be budded.

PEACH.

Peach-pits are perhaps the easiest to germinate, and almost any person can make a success in raising seedlings by observing a few of the most important rules applied to their propagation. The best seed, or pits, are from seedling trees, or, as they are termed, "natural fruit." The practice in California is to buy the pits from driers and canneries, collected from all sorts and sources. The result is, that a very large amount of pits is required, as only about one-third (or even less) germinate. The cause of this is, that pits from such fruit are generally defective, and many of the varieties sought for by the drier and canneries are subject to "splitting" at the pit, which do not germinate, the germ rotting after the pits are planted. There are many varieties of California seedlings having perfect seeds, but as the driers and canneries do not separate them, the grower must take his chances in obtaining good seeds from such sources.

Pits from seedlings, or natural fruit, are always the best; they are not subject to splitting at the pit, and nearly all germinate, and the plants become the most thrifty stocks. It is contended, and justly so, that the longevity of the tree is dependent in a great measure upon the healthy condition of the seed.

The seed of seedlings, or natural fruit, is more vigorous, and most certain to germinate, and there can be no doubt that the trees will live longer when grown under such conditions. The union of the two halves, or valves, of the pits of seedling fruit is very close and tenacious, while in pits of budded fruit it is often slight and imperfect. The kernels of pits from natural fruit are generally quite hard, close, and nutty, while in those of budded fruit they are often defective in form, and the two halves frequently separate in handling. The author is not aware of any orchard where trees of natural fruit are maintained

for seed, and as the cultivation of the Peach, principally of fine sorts, has been so much extended, natural fruit is not easily obtained.

As the growers will have to produce most of their stocks in the future, it would not be amiss for them to plant seedling trees, and maintain them for the specific purpose of producing seed. The pits should not be allowed to dry after being taken from the fruit; they should immediately be put in sand, or layered in the ground, to prevent the germ from drying. Often pits are planted that have become dry, and do not germinate the year they are planted, but will sprout the season following, if allowed to remain in the ground undisturbed. Great care should also be observed that the pits are not put in large piles after being taken from the fruit, but they should be spread out, to allow the moisture among them to disappear. Often they are put in large piles, and left in those piles for several days, during which time fermentation of the acid from the fruit takes place, and the germ of the kernel destroyed.

There are several methods in use for layering the seed. The most common one is to layer the pits in a well-prepared seed-bed in the autumn. The place selected for the seed-bed should be in soil free from standing water during winter, as the seed is to remain until spring, and a superabundance of moisture tends to destroy their germinating power. The earth is spaded away for a depth of 6 to 8 inches, and the pits spread indiscriminately about 4 to 6 inches thick, and then the earth is spread on top, covering them for 4 to 6 inches. They are allowed to remain there until early spring. In some places they begin to germinate very early, and later in others.

Another method is by spreading the seed thickly about 4 to 6 inches deep, and then spading in about 6 inches deep. This completely mixes the seed, and it is covered in the soil. In either method the seed must remain in the ground until spring, when the shells are so far loosened that, in handling, they separate from the kernel. The kernels are at that time swollen, and many will be found sprouted. They are then ready to be planted in the nursery, and care is required in their handling, as carelessness will break the tender roots of those sprouted. The planting of the seed in permanent nursery rows in the autumn is also practised, but is not recommended, as the seed does not come up evenly, and prevents the ground from being worked after rains, &c. *J. J. Willis, Harpenden.*

(To be continued.)

A TRAVELLER'S NOTES.

(Continued from p. 299.)

TOKYO, August 27, 1892.—The chief florists' flower to be seen at present in Tokyo is the *Convolvulus*. With the Morning Glory, Japanese specialists have done much, being rewarded not only by obtaining the most distinct and varied tints, but also by producing forms of foliage different to any I have seen. Of leaves, I have made a collection. The variety in the form of the leaf is as great as in the colours of the flowers, and there is certainly a wider difference between the various forms and distortions of the former than between the various tints and shades of the latter. The pronounced colours, leaving for a moment the innumerable intermediate tints and shades apart, are rich and good, though they are not so many as might be expected. Rich violet, a glossy carmine, a good clear dark blue, white, and pink, are well-fixed colours, present in every collection; between these are every conceivable tint, from a dirty, repulsive-looking brown, to lilac, dull shot, brick-red, and sulphur. Spotted and mottled varieties are common, many are also edged with white, but striped kinds are almost unknown; I saw but one or two, and these I doubt being constant.

Leaving my quarters at 3.30 A.M. on the 19th inst., two sturdy men rolled me through the dark and deserted streets of Tokyo to Iriya, in the district of Shitaya. I sighed as I entered that district—rows of nurseries I had never entered nor heard of, notwithstanding the many dozens I had toiled through in the various suburbs of this great city.

Soon after 4 A.M. I alighted, and found myself in a narrow street, with high split Bamboo fences on

either side. As these were some 9 feet high, and it was still dark, the view was confined.

At 4.15 a nursery was opened. I entered, and drank straw-coloured water, a compound the Japanese affectionately call tea, and waited for the sun to rise. The household began to bestir itself—that is, its various members picked themselves up from the floor, rolled their quilts up, took down a couple of walls (composed of sliding screens), opening the entire house to the garden, came outside, dipped a hand in a tin receptacle containing about a pint of water, passed it carefully over the face, used coarse salt as a dentifrice, put themselves on the top of wooden clogs, bowed low and with dignity to the foreigner (who was a fairly cheap sight), and were ready for the day's work. Soon after 4 A.M., the sun began to rise and the folded buds of the *Convolvulus* to open. In an hour all the plants, placed for the night on the ground, were arranged, their pots sunk in porcelain jars of various designs, on wooden stages in a low shed. Some remaining over were so stood in blocks to form winding paths, and carefully shaded even at that early hour, for by 9 to 10 A.M., even with these precautions all are passed. As rapidly as the sun rose so rapidly did the flowers open. Visitors began to enter the nursery and exhibited much interest in the plants, many of the Japanese being "grands amateurs" of the *Convolvulus*.

The plants thus referred to were some 2 to 2½ feet high, trained round fine stiff straws such as we train our greenhouse creepers; they bore from one to eleven open flowers each, three, five, and seven being the averages, in price such plants varied from 4 to 8 sen.

A few large plants from 4 to 6 feet high were very fine. The single varieties are most common, though the double, to my mind less beautiful and beyond question less showy, are apparently more highly prized. In the latter there is considerably less variety, added to which the cup, unable to contain the large petaloid stamens frequently splits on one side, the delicate contour and symmetry of the flower being naturally destroyed.

I visited many nurseries, all side by side, streets of nurseries, a district of *Convolvulus*. All are much the same in every respect.

Besides the nurseries are enclosures containing groups of life-size figures with *Convolvulus* trained over them. These represent legends or historical events, the figures having the hair dressed, and the clothing (a framework covered with moss), cut in ancient fashion. The foreigner has the privilege of paying 2 sen. to enter here, though by the general giggle which invariably prevailed on my depositing the modest copper, I am convinced the Japs paid but one.

These little scenes are pretty, and carefully designed; the open *Convolvulus* flowers covering a naked sword, creeping up clothing, or arranged in a woman's hair, are very effective.

In one enclosure I literally lost myself in a large maze of split Bamboo some 8 feet high, covered by trailing *Convolvulus* in great variety.

A somewhat powerful scent of an artificial fertilizer pervaded all the nurseries. Neat glass bottles with labels and instructions in Chinese characters, on small stands contained the mixture, which was evidently freely applied. *James H. Veitch.*

(To be continued.)

HYBRIDISATION: ITS BENEFITS AND RESULTS TO ORNAMENTAL HORTICULTURE.*

(Concluded from p. 352.)

It has been generally accepted as an axiom that species with irregular flowers cross more readily than those with regular blossoms, and a superficial review of garden forms seems to confirm the opinion. But if we stand back, and allow Nature to speak for us here, she will utter a word of caution. Such genera as *Anemone*, *Ranunculus*, *Aquilegia*, *Dianthus*, *Hypericum*, *Vitis*, *Rosa*, *Geum*, *Rubus*, *Epilobium*, *Rumex*, *Salix*, *Narcissus*, and *Carex*, claim the large share of wild or natural hybrids. How, then, has the popular fancy originated? Simply, we believe, because irregular flowers always have a charm for cultivators that is only equalled by that of the finest regular species. Nature, we say, works most easily on regular forms, and this fact should be kept clearly in view for the future. During the past quarter-century irregular ones have been the favourites, the *Begonias* only being to a degree an exception. We

* Presented at the St. Louis Convention of the Society of American Florists by Dr. J. M. Macfarlane, Lansdowne, Pa.

do not wonder that it has been so, for irregular shape and showy or varied colouring usually go hand in hand, while the halo of light that Darwin and his successors have shed round their structural relations makes everyone desire to imitate the insect or humming bird, even though they do not claim the nectar for their trouble. We say, then, that among our showy regular flowers is a neglected field waiting to be cultivated.

No question probably in the whole range of our subject has been so debated, or had so many theories tacked on to it, as that which deals with the relations and resemblances of a hybrid to its parents. Though careful scientific students like Köhreuter, Gärtner, Naudin, Wichura, and Darwin favoured the view that hybrids are averagely intermediate between the parents, their eyes were open to the fact that the appearance of erratic and divergent forms occasionally seemed to weaken their position. Among florists the aim appeared often to be the obtaining of marvels rather than improvements, and so the many evenly-balanced crosses were less noticed than the divergent ones. Our gardening journals for decades presented articles in which the prepotency of the male parent was warmly supported by some—and we should judge by the majority, while that of the female was as keenly held by others. From extended observations that the writer has made, alike on living plants and on their minute tissues, he adheres to the view that an average hybrid is nearly intermediate between its parents. But it is to be remembered that, if individuals of the same species are built up of unstable and easily-decomposed chemical compounds, such will probably be truer of a hybrid, which may well be regarded as an attempt to make two diverse things balance as one. We need not be surprised, then, that so many freaks appear, some of which vibrate toward one parent, some toward the other.

Many of you may be inclined now to ask, "What remains to be done by the florist?" To that I answer, "Nearly everything," and I am persuaded this correctly expresses the true position of affairs to-day. My reasons for giving the answer are: First, that many of the finest-flowering plants are not yet in cultivation. Take, for example, the exotic field that lies most conveniently to ourselves, I mean central America, from New Mexico to the Argentine Republic. Though we are already indebted to that vast region for many of our best stove and greenhouse plants, its resources have scarcely been touched, except in the matter of Orchids. The same is true also of central Africa and Asia, of New Guinea, and many of the Pacific islands. Second, if we take as a criterion the work done among a few species during the last twenty years, the answer is a correct one. Third, if we consider the limited facilities, and the many hindrances, that have hitherto existed in conducting pollination experiments, the wonder is that so much has been done. The hybridiser has frequently to accept as parents not what he will but what he must. He may wish to cross two species from whose descendants he hopes for great things, but he has only one parent in flower. He hunts up his gardening friends to see if they can supply pollen of the other, or of some suitable parent. Happy is he if his search is successful.

In speaking as I have done of exotic plants, do not suppose that I discourage the culture of our native plants. Far too little attention has been given to them. But what, it may be asked, are the groups that deserve attention? We have a wide field to choose from, but I can only indicate a few. Some of our native and exotic *Polygalas* have a habit, floral structure, and colour, that entirely commend them. The St. John's Worts, or *Hypericums*, are now becoming favourites on rockwork and in herbaceous borders, and though natural hybrids have now and again been recorded, the pretty *H. Moserianum* × is an artificial one of recent date that all speak well of. Others should be forthcoming. It is surprising that so few of the *Malvaceæ* have hitherto been worked. Our native Swamp Mallow (*Hibiscus moscheutos*) is a noble

plant, and if crossed by a dwarf species, something very distinct might be gotten. Hibiscus, Abutilon, and Malva are all deserving of attention.

Pelargonium has hitherto ruled supreme among Geraniaceæ, but why is it that the genus Oxalis, cultivated for more than a century and including nearly two hundred and fifty species, has yielded only a few sports and still fewer hybrids? We venture to predict that were crossing and selection practiced here, the Oxalis would again become the favourites they once were. Equally true is it of Impatiens. Some fine species are now common, and, though annual, their rapid growth and wealth of blossom, puts them alongside the Petunias that have had so much favour shown them.

It has always seemed to the writer remarkable that the Pea order should have furnished so few crosses even under cultivation. Neglect may be the simple explanation. Already we have the gorgeous hybrids of Brownea, but the whole group is practically untouched. Skill and care will be needed in manipulating them. As already indicated, Nature shows us that the Rose order is an inviting one, but though fine hybrids of Rosa, Geum, and Potentilla are in cultivation, many herbaceous, shrubby and tree types remain to be taken in hand.

I should like to linger for a little over the Onagraceæ. The successes wrought on the continent with Fuchsia from the southern hemisphere should meet with a response from Americans in the species of Oenothera, a genus that includes nearly a century of species, mostly western American. Such lovely evening Primroses as *O. Whitneyi*, *O. marginata*, and *O. cæspitosa* might have their rather short-lived flowers prolonged, their habit improved and their scent accentuated by union with *O. speciosa*. Or some of these again might be combined with the large yellow-flowered species. In aiming at such crosses our florists should not think only of the short twilight prevalent over many of the States, but of the longer one enjoyed in England and other European countries where these handsome plants are eagerly welcomed.

If any order deserves to be called American and *par excellence* St. Louisian, that is the Cactaceæ. The ease with which they can be crossed, and the small care needed in their cultivation, are most commendable qualities. If we may judge from past experience, the order lends itself well to the hybridizer, as is proved by the union not merely of *Cereus* and *Phyllocactus*, but of these again with *Epiphyllum*.

We spoke of central America as a source of supplies, but the wealth of such Rubiaceous genera as *Pinimera* would alone furnish material for extended work. The remarks made regarding the Pea order equally apply to the still larger group of the Daisies and Sunflowers. Many wild hybrids of the Hawkweeds and Thistles are known, but garden hybrids are rare. Yet see how much success has come to the Erfurt strains of *Zinnia*, and to the now time-honoured *Dahlia*. These are finger-posts to the florist in the truest sense. Did time permit, the Heaths, the Milkweeds, and many others might be noted, but one group cannot be passed over. All who have seen a well-grown specimen of *Bignonia venusta* clambering over some Florida home, or wreathing the roof girders of a hothouse further North, have stopped to admire. It and its allies are choice climbers. Blending of such hardy species as *B. capreolata* and *B. grandiflora* with other yellows and reds, also of *B. speciosa*, *B. purpurea*, and the lovely Mascarene *B. Telfairie*, would be noble work in itself.

Among Monocotyledons the Orchids, Cannas, Hedychiams and Amaryllis have been so prolific in blending, that we may safely take them as an index for all, and as a verification of my position that however much has been done the serious work and best fruits are yet before us.

In conclusion, let me suggest to some enterprising florist an idea that has often occurred to me. All leading commercial governments of the world are

now wisely establishing stations for rearing, propagating, and distributing economic and other plants. Would it not repay the efforts of private firms to do likewise? Mexico and central South America are rich fields that are daily becoming more accessible. Such a forward step might mark the commencement of fresh triumphs in the floral world.

THE ROSERY.

ROSE TURNER'S CRIMSON RAMBLER.

THE publication of a coloured representation of Mr. Charles Turner's new Polyantha Rose, affords an opportunity to call attention to the remarkable growth plants have made during this summer. When looking over a plantation of it, a few days ago, in the Langley Nursery, one could not but be struck with the free growth it displayed in the form of long sturdy shoots, just as a climber should do. But the characteristics of the foliage are so marked, that it appears to look more like a species than one of the Polyantha group, though its large and bold clusters of flowers follow the Polyantha type. As a summer-blooming Rose it is almost unrivalled, but unlike the varieties of the Polyantha section, it does not bloom in the autumn. It has all the appearance of an Evergreen variety, and scarcely a plant showed loss of leaves, while many of the hybrid perpetuals were nearly or quite leafless. Its proper method of treatment will probably be, cutting away the old wood as soon as it ceases to produce flowers, leaving the young wood unpruned to supply blossoms. Judging from the present appearance of the plants, it is a good hot weather Rose. Mr. Harry Turner states that it does best on its own roots or on the Manetti. Certificated by the Royal Horticultural Society about four years ago under the name of The Engineer, when shown by a nurseryman in Lincolnshire, its value appears to have escaped the notice of some of our Rose nurserymen until it came into the possession of Mr. C. Turner, who is distributing in the coming autumn. As a pillar Rose it will scarcely leave anything to be desired. Of its extreme hardihood there can be no doubt. *R. D.*

FLORISTS' FLOWERS.

TREATMENT OF CHRYSANTHEMUMS AT THE PRESENT SEASON.

A VERY few weeks from the present will witness the crowning point of the grower's labours in the expansion of the blossoms, but whether success will be as complete as could be desired, is a matter that time only can decide. The term autumn treatment applies from the time when the plants are housed, and it embraces most important details in the matter of culture, because errors made then may render abortive a whole season's labours. Let us first deal with plants grown for large blooms—that is, those which under the orthodox method are allowed to develop three blooms apiece. It is generally admitted that this method enables all the points which any variety may possess to be observed and judged according to the present standard of excellence, better than any other. These points of the standard of excellence are as follows:—Dealing with the more important Japanese section first, it may be said that bloom of large size without coarseness, with breadth of floret according to the peculiarity of each, depth and solidity of the whole bloom, and, lastly, colour. In no other manner of growing these plants is colour brought out so clearly as when large blooms are grown. In some varieties wide differences are shown in colour as compared with the same variety when grown for quantity of bloom, that the plants are scarcely recognisable as being of the same variety.

As a rule, the colour of the flowers on bush plants is lighter than that of flowers on other kinds of plants. With regard to incurved blooms the points of excellence are more numerous than in Japanese, there being not only size, depth, solidity, breadth of

petal, form, freshness, and colour peculiar to the Rose, but a finish also. Tyros in *Chrysanthemum* culture have to master all these various characteristics of a good bloom; and a bloom that is wanting in any of them cannot be considered worthy when judged, either in competition, or otherwise.

If the treatment of the plant up to the present moment has been right, there should be no difficulty in dovetailing, as it were, the autumn treatment into that to be afforded the plants during the summer. Placing the plants under glass protection should be performed forthwith, as frost may be expected, the slight showers of hail that fell lately being a pretty sure forerunner of cold weather. It is venturing too much to allow the plants to remain out-of-doors after the first sign of colour in the florets is noticed, as development cannot be retarded, and allowing the plants to be rained on, or exposed to heavy dew, is a sure cause of damping of the florets at a later date. Even in the case of plants whose buds were formed late, they are less safe than those whose buds are of the size of a large Hazel-nut, the former being soft, and consequently less able than those to withstand frost, and the plants should have some kind of temporary protection, such as is afforded by tiffany, &c. Before plants are taken indoors, the foliage should be examined for mildew, particularly the lower side of the leaves. The best remedy for mildew which I know of, is syringing the plants with a mixture made as follows, and thoroughly wetting every part with it:—Place 2 lb. of sulphur and 2 lb. of lime, that which has not been slaked, in ten quarts of water, and boil for twenty minutes, let it cool, and when settled, decant it. For syringing purposes, use two wine-glassfuls of the mixture to four gallons of clean cold water (soft, if possible), either laying the plants on their sides, or using a sprayer on the syringe.

The arranging of the plants in the house is a matter that will depend upon circumstances. No position suits them better than a vinery or Peach-house, from which the fruit is gathered, and the leaves of the permanent occupants have begun to drop. A span-roofed greenhouse is another capital place for them, but it is seldom that a house of this kind can be wholly set apart for them. A long sloping bank of the plants is the best in such a position, both for observation, convenience of watering, cleaning, &c., and the welfare of the plants. If exhibiting is the chief point to consider, it is wise to place the Japanese varieties in a house by themselves, so that more fireheat can be given them during the time the blooms are developing, as then the flowers are improved, the colours are brighter, and the florets come out cleaner and more regularly than is the case if no fire-heat is employed. In all cases place the plants near the light, and do not shade them from it by other plants, as the colours are then brought out more fully, and the flower-stems not drawn up weakly. The strength of the flower-stem may be taken as a good indication of what the flowers will be. For the first ten days or thereabouts after the plants are housed, those which do not show colour should be syringed daily at about 2 P.M. This treatment is rendered necessary by the sudden change the plants have to endure from the moistness of the night air outside to the dry atmosphere in the house. This syringing should, however, only be done in fine weather, and it acts as a stimulant to growth and flower development. Directly the florets commence to unfold, syringing should cease. Abundance of air should be afforded night and day, but diminishing the night supply as the blooms begin to open. In damp or dull weather the heating apparatus should be made warm, which will dissipate moisture. It is by allowing the air to become too cold during the night that the petals are rendered damp, and blooms are spoilt by strong sunlight if no shade be given. It is wise to lightly shade the blooms during the hottest part of the day, not only as a preventive against damping, but scalding, which is really worse than damping, as it sometimes destroys blooms in an undeveloped state. Continue to afford various kinds of manure to the plants, and depending

for a short time only upon any one kind. Some growers say that the stimulation of growth should cease when colour is first manifested in the bloom of any plant, but in my opinion the plants have to bear the greatest strain at that period, and need liberal support until the blooms are three parts expanded, when manuring should cease. Sulphate of ammonia is a capital stimulant, especially to late plants, if it be used with care. Half an ounce to one gallon of water, and increasing the quantity to three-quarters of an ounce, hastens the development of the plants.

As the flowers approach full development, watering the plants should be performed in the morning, so that the house may become dry before nightfall. Should mildew appear, dust affected parts with flowers-of-sulphur. Earwigs will be troublesome when blossoms are opening, nibbling the succulent petals by night, and should be trapped with pieces of Bean-stalks cut to 1 foot or 2 feet lengths, thrust in among the foliage, and into which the earwigs creep during the day, out of which they may be blown into scalding water, or otherwise destroyed. *E. Molyneux.*

CHRYSANTHEMUMS IN THE CONSERVATORY.

The style of arrangement in home decorations must, to a large extent, be regulated according to the formation of the house. In hardly two cases would it be possible to adopt the same methods, with the same effect as a resultant. The pernicious evil of over-crowding is oftentimes to be seen, the plants being positively stood pot upon pot in some cases. This ought not to be; it gives, for a time, a huge blaze of colour, it is true, but the mass of plants, being so dense, tends greatly to hasten the decay of the flowers when once any such symptoms are apparent, this being the case much sooner than it should be. It is easy to see how this is brought about; the mere fact of overcrowding causes the foliage to fade before its time, facilitated frequently by the presence of mildew, which would, in a measure, be held in check if the plants were not so thickly arranged, so as to exclude light and air. Furthermore, for want of air, any moisture settling upon the plants is not so easily dispelled, whilst the mass of soil must throw off a considerable amount of moisture. The waterings from time to time cause the ground upon which the plants are standing to be far too damp. These circumstances all occurring at this, the dullest season of the year, make the case even worse than it would be at other times. Some may think that it does not materially matter about the decay of the foliage, but losing this essential part of the plant militates against the proper development of the flowers. Another most important point is that of being able eventually to secure good cuttings. This cannot be done when the plants are stood so closely together, the result being obvious enough. Extremely tall plants are not nearly so useful in a general way for home use as those of medium height; what are termed "cut-backs" being in this respect much better, the flowers being brought more within the range of vision; plants 9 and 10 feet high are not in any sense desirable. There is now a mania for large or exhibition blooms; these, in their way, are all very well, but a few more of them on each plant, and not quite so many plants, will, for home uses, be found preferable. It is not the largest blooms which keep the best, particularly in such a foggy period as that which we are now likely to experience. If the number of blooms were about doubled, the utility and effect for home use would be further enhanced. Such plants as these could be stood much further apart, and yet make a capital display as a group.

For home use, also, more attention should be given to dwarfier plants of all sections, but more particularly those of the Japanese, which are not disposed to grow extra tall, and the Pompon section also. I have grown the Japanese thus, and noted their utility; a case in point to bear out the effect produced by these was given in the beautiful finish to the group shown by Messrs. Reid and Bornemann at one of the Crystal Palace Shows last season. This group was a pattern of what an exhibi-

tion group should be; too much crowded, it is true, for home uses, but exemplifying what decorative plants should be like. The dwarf plants in this instance were on the average not more than 21 inches in height; this kind of plant by striking late is to be had easily enough. In the conservatory, a central group where it is possible to arrange in that manner is very effective. Another good plan is to break up the plants into distinct colours or varieties, this I think will often create more interest in them, whereas a few plants stood thus are easily to be got at for any purpose. By intermixing a few of the hardier foliage plants with the Chrysanthemums, these being either tall ones or dwarf, the effect is further enhanced.

Tall Palms of comparatively slender growth, tall Cordylines, plants of *Grevillea robusta* on single stems, *Eulalia japonica variegata*, and *Jacaranda mimosaefolia*, would all do for intermixing, whilst around the outer margin by the use of dwarf foliage plants, no pots need be an eyesore. The too free use of sticks ought also to be guarded against when used in numbers, painted ones are had enough, but white ones much more so—yet these latter are often seen. Another great advantage in arranging the plants in small groups is to be found in the interchange where necessary, early or mid-season kinds being taken out without so much labour, to make room for the later ones. In any case, it is not desirable to mix together early and late kinds. Decisive colours, that are always attractive, should be grown more largely than some others. For instance, *Avalanche* as a white, *Sunflower* as a yellow, *Val d'Andorre* as a red, *Madame de Levin* as a purplish-rose, and that new and promising variety of the same style of growth as *Avalanche*, viz., *Col. W. B. Smith*, of old gold-yellow colour. Others could be named, but these are quoted as being essential colours. The single varieties, as they become better known will, I am fully persuaded, play an important part in home arrangements. I noted last season what attraction they caused where shown in good condition. Trained plants, as so understood in exhibitions, only exhibit in home use so much time wasted in the work of training, which might in all probability have been much better expended in more direct cultural detail. *H.*

NURSERY NOTES.

FRUIT TREES AT LANGLEY.

ABOUT a mile and a half from Slough is the Langley fruit tree nursery and seed trial grounds of Messrs. Jas. Veitch & Sons, Chelsea. The ground was bought some ten or twelve years ago, and was used during the first few years almost exclusively as a trial ground for seeds; but a portion was reserved for the growth of fruit trees, and this has been yearly increased, until now they are grown in quantity, and perhaps it is the most important item in the nursery, the area of which is about 60 acres. A walk amongst the trees of different ages suffices to prove that a happy spot has been selected, and one that is well adapted to meet the requirements of the Apple, Pear, Plum, and Cherry. These four kinds are those most grown here; the Peaches and other such fruits are kept at Southfields, Fulham, as heretofore, where another collection of trees of Apple, Pear, Plum, &c., is likewise cultivated for sale. No district has had less water during this exceptionally dry season than the neighbourhood of Slough, and even the showers that were pretty general, and which intervened between what will be known as the first and second droughts, were denied this locality, Messrs. Veitch still giving March as the date when the last rain fell which was of any importance. Fortunately, the soil is of good stiff and fairly retentive character, and the result is not so disastrous as it would have been on a poorer soil. The only effect we could notice when visiting the place a few days ago was that the growth made during the year has been rather less than usual, but the trees are clean and healthy in appearance, and the wood thoroughly

well ripened and bearing finely-developed buds. Perhaps this unusual ripening of the wood will more than compensate for the lack in headway made this year. In fact, the trees here are affected by the season much as we have seen them in many situations, but they differ from some in that they have not been so infested with thrips and spider, which have been very troublesome in some gardens. Budding was completed about a fortnight before we were there, on first-rate looking stocks. About 7000 or 8000 Apples are put on the *Paradiæ* each season; the batch worked last year are in good condition, there are but few failures, but the length of growth is not normal. Those on the *Crab* have felt the drought in a less degree, and a batch of one-year-old pyramids from maidens cut down last winter look capital. All shapes in Apples and Pears are grown, from 7 feet standards to the horizontal cordon. The half-standard is a useful tree, and finds favour particularly with market growers who plant *Currant* and *Gooseberry* bushes between the orchard trees. Pears that will not succeed well on the *Quince* are doubly worked. A variety that is known to be a good one for the purpose is worked on to the *Quince*, and then the variety such as *Marie Louise*, and many others that require this treatment are worked on to the scion, and are thus after all on the *Quince* roots. They will succeed treated thus, although they dislike direct transference to the *Quince*. Cherries succeed with but little trouble, the district being one very suitable to them. All varieties and forms of training are cultivated, and the trained trees could not possibly present a better appearance than they do.

Plums also do well, and the whole of the fruits shown by the firm at the meetings of the Royal Horticultural Society and other exhibitions are grown here; and this applies also to the Apples, Pears, &c. In a long border round the land are about three hundred and fifty varieties of Apples in rows, containing three of each sort; and Cherries are kept to two of a variety, Plums to three of a variety. This is the trial-border, and from these trees is picked all the exhibition fruit, and from them are taken all the grafts, except in those cases where an exceptional number is required. Cherries and Plums were, of course, all gathered, and Apples and Pears also from the trees in the quarters, but there were many of the later kinds still hanging on the trees in the trial-border.

One of the first to be noticed was the old Northern Greening, which was in very fine condition, and exceptionally high-coloured for this variety. *Reinette Thounin* is the name of a variety that came from France two years ago, and is now fruiting for the first time; it may prove a good one, and is much like Northern Spy in appearance. *Sandringham* grows a perfect shape, is of good constitution, and is a first-class late Apple; its quality is such that it may be used for kitchen and table. There were some fair samples on some trees that had been moved in the spring. Lane's *Prince Albert* and Brownlee's *Russet*, two thoroughly good varieties, are still on the trees; the latter variety is a good grower, and bears very freely. *Barnack Beauty* was in very good condition, and the variety—a very pretty one—can be recommended as an exceptionally late keeper. *Harvey's Wiltshire Defiance*, *Alfriston*, *Baumann's Red Winter Reinette*, and *King of Tomkin's County*, were all deserving of notice. *Belle du Havre* is a good culinary Apple, that colours exceptionally high, and carries a thick bloom. Another highly-coloured one is *Winter Colman*, and it is of good size. A good heavy culinary Apple will be found in *Watson's Dumpling*. A very large fruit is *Roundway Magnum Bonum*, an old variety, but yet one of the best dessert fruits, and should not be allowed to drop from any collection. Other really good Apples which were noticed are *Scarlet Nonpareil*, Herefordshire *Pearmain*, *Northend Pippin*, *Sturmer Pippin*, *Warder's Pippin*, *Striped Beaufin* or *Beefing*, and *Bismarck*—the latter a wonderful grower, exceptionally free-bearer, and good in every respect.

Of Pears the best were gathered, and we took notes

of but few. However, Beurré Clairgeau was in capital condition—always a handsome fruit. Gooseberries and Raspberries are well done at Langley, and the bushes are in capital condition.

THE PRODUCE OF ESSENTIAL OILS.

THE essential oil-yielding plants both in England and in France have had a rough time of it this year, owing to the long-continued drought in both countries. It is well-known that Mitcham Lavender and peppermint oils take the first place in the markets of the world; and the current price for good Mitcham Lavender oil is at the present time 70s. per pound. Very little oil it seems has been distilled this year, owing, in the first place, to the scanty nature of the crop, and in the second to the high prices the freshly-gathered plant realised in Covent Garden market. Peppermint oil also is a small crop, so far as the Mitcham produce is concerned; and the present quotation is 34s. per pound. Besides affecting the yield for the present season, it is found that the long drought has seriously affected the prospects for next year, as many of the young plants have been killed. It is reported also that the yield of Chamomile oil in the Mitcham district has been extremely scanty, there being only one field in which the flowers were even moderately good, and that field was protected by hedges from the sun. In the south of France the peppermint harvest was barely up to the average.

"The newly-distilled essential oils of Alpine flowers, Lavender, Spike, Thyme, &c., produced on the itinerant stills, are just beginning to arrive from the hills. Every year when these flowers attain maturity, a whole army of distillers, either working on their own account, or sent by one of the large perfumery firms, invades the Alps as far as the Piedmontese valleys to distill these Alpine oils, which are afterwards brought into commerce through Grasse and other districts, and of which the consumption is growing larger every year, partly it is said, because French Lavender and Spike are gradually superseding the Ceylon citronella oil in the soap industry.

"During the last few years Algeria, however, has commenced to enter into competition with the French Alps as a producer of these oils, and this year the Algerian output appears to be particularly large."

On the subject of the otto of Rose crop in Bulgaria, which has been generally reported as a partial failure, the *Chemist and Druggist*, upon whose authority the preceding notes are based, says, "There is no shadow of ground for assuming that the output of otto has been such that there is any justification whatever for the great advance in price which was sprung suddenly upon the trade a few weeks ago by a Constantinople firm, followed by other dealers." But that the unexpected rise is simply the result of a kind of combination, in which some principal foreign firms have taken the lead.

"A singular story is said to be current in Bulgaria, with regard to the adulteration of otto of Rose this season. Some years ago the importation of Palmarosa or Turkish Geranium oil, the favoured adulterant of the otto, was prohibited under stringent penalties. A few weeks ago a large consignment of so-called petroleum, addressed to a well-known Bulgarian firm of distillers, excited the suspicion of a Customs official, who, unfortunately for himself, forgot the good old maxim, that too much zeal is always misplaced. The consignment had already passed the frontier unchallenged—nay, unopened—but the official insisted upon overhauling it, when it turned out that the petroleum barrels contained nothing but Palmarosa oil. At this moment the unfortunate official was overtaken by his superior officer, who sharply reproved him for meddling with things he did not understand, had the barrels closed again, and sent off straightway in landaus to the distillery. The affair, unfortunately, got abroad, and it is now added that the superior officer had

received an intimation from a powerful government official, who also happens to be a partner in the otto of Rose factory, to which the 'petroleum' was consigned, that this shipment was expected to be passed through the frontier-post without any inconvenient inspection. The head man had dutifully done the part expected of him, but the underling was not let into the secret. He is not likely to be promoted now for some time."

This shows how things are managed in high places.

COLUTEA ARBORESCENS.

WHAT a capital shrub this one is for London gardens, if it be provided with a fair amount of good mould, and is not hemmed in and shaded with trees. Its pea-shaped yellow flowers appear in June, July, and August, and are succeeded by semi-transparent, bladder-like seed-pods, hence its popular name—Bladder Senna. It gets straggly when aged, but bears cutting in, breaking into profuse new growth the same year, if the operation be performed in the winter; and then the shrub needs to have much of the weaker shoots thinned out in May and June. The peduncles usually carry six flowers.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

VINES.—Late Grapes which have to be cut from the Vines and kept in bottles of water till April or May should be thoroughly ripe about this time, otherwise the flavour will depart in great measure, and the fruit will shrivel after bottling, and long before the time when the fruit will come on to the table. It is the previous year's preparation which enables Grapes to be kept in good condition so late. I had Lady Downes' Seedling this year as late as August. To ripen Grapes at this season, fire-heat, with abundance of air on night and day are necessary, and some means should be taken to throw rain off the borders—this accelerating the ripening. Muscats which are not ripe should be freely exposed to light, and plenty of warmth allowed in the pipes. If any berries are stoneless or shanking, they should be removed. As soon as it is ascertained that the fruit is really ripe, the fire-heat should be reduced in degree gradually, till a minimum of 50° to 55° at night can safely be maintained; then keep the vinery as dry as possible, only using fire-heat to expel moisture, and keep an even temperature till the leaves fall, removing all those that fall without delay.

PEACHES AND NECTARINES.—Late fruits, such as Golden Eagle Peaches and Victoria Nectarines, should be assisted with fire-heat to ripen them; on standard bushes such sorts are slow to ripen in cool houses, especially in northern parts, a damp cold atmosphere renders the fruit insipid, and fit only for culinary purposes. Early trees may now require attention by partially removing the leaves from ripe shoots, but where the trees are not matured, some assistance with fire-heat, and air to mature the wood should be given. If the foliage clings lightly to the wood it should not be forced off; but large watery leaves may be cut in two (a practice I have adopted with success for many years on over-gross foliage), to allow sun and air to have full power on the buds. Trees which fruited early may be pruned, leaving young shoots to take the place of the old, and if systematic disbudding is resorted to, there will be but little pruning required, but an even succession of bearing-wood must be maintained, which should not be closer to each other than 3 to 6 inches, and they are better at the latter distance. No snags or dead-wood should be seen in a tree after it is pruned. Peaches grown as bushes are sometimes used for early fruiting, and should be well thinned out, retaining short, firm shoots and natural spurs. I do not follow the practice of painting our Peach trees with adhesive mixtures, but thoroughly wash the bark with Gishurst Compound-soap, cleaning all the wood-work, the glass, and the hot-water pipes with soft-soap and water; the soil is then shovelled from

the surface of borders, and is replaced with good loam mixed with bonemeal or Thomson's Vine Manure at the rate of a quart to each wheel-barrowful of the soil; and a fumigation with Tobacco-paper finishes the preparation for forcing. The structure remains open, dry and cool till December, when slow forcing is begun. The evils from cramming early Peach-houses with Chrysanthemums and other plants are often too apparent by bud-dropping and early appearance of black or green aphid.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

STOVE PLANTS.—Allamanda Hendersonii, Bignonia Chamberlaini, Bougainvilleas, Clerodendron splendens, Combretum purpureum, Dipladenia insignis, Hoya carnosa, Hexacentris mysorensis, Ipomoea Horsfieldi, Jasminum Sambac, Pergularia odoratissima, Stephanotis floribunda, Thunbergia grandiflora, and plants of similar climbing habit of growth, planted out in borders or in large pots, should now be well pruned, and the shoots thinned out, thus affording light and air to plants which may be growing underneath them. The remaining shoots and the stems and leaves should also be freed from insects. After pruning keep the plants rather dry at the roots so as not to afford any encouragement to grow during the winter. Pergularia odoratissima is a sweet-scented plant that has been very beautiful this autumn, and the best method to prune with it is to cut the shoots or stems down to the ground in November, leaving only a few eyes above the roots, and keep it rather dry at the root till the spring, then with heat and water afforded, it will grow as fast as a Runner Bean, and produce large clusters of the most delicious scented flowers. Specimen plants in pots of Allamandas, Bougainvilleas, Clerodendrons, and other deciduous plants should gradually be brought to a state of rest by withholding water to a greater or lesser degree, and affording plenty of air to ripen the shoots, after which they may be placed in a cool stove or intermediate-house till required for starting in the spring. Ixoras, Crotona, and Palms should be kept free from scale and other insects, and receive careful watering and daily syringing; they are plants which must not be allowed to get dry at the roots. Gardenias and Eucharis amazonica, where flowers in long succession are required, should have a liberal application of a good plant-food, and be grown in a warm, moist temperature.

GLOXINIAS, GLORIOSAS, CALADIUMS, and early-flowering Gesneras should be stowed away to a cool part of the stove as soon as the foliage is withered or decayed. Shading should now be removed from roofs of glass-houses, and the temperature kept lower as daylight shortens; for the present, 65° to 70° by night, and 75° to 80° by day will suffice. Syringe the inmates twice daily during bright weather, and give air whenever it is safe to do so, especially avoiding codling at this season; and let each plant have as much space and light as can be afforded, to maintain a stiff sturdy growth.

HERBACEOUS CALCEOLARIAS sown last month should be pricked out into small 60-pots as soon as they are big enough to handle, and be kept in the shade under glass on the north side of a wall.

SEEDLING CYCLAMENS sown last month should be pricked out as soon as large enough, placing them afterwards on a shelf near the roof-glass in a warm greenhouse, affording a little shade from bright sunshine. Those in ferneries coming into flower will be the better for being placed on a low table or shelf in a house where they can be seen to advantage, and their requirements carefully attended to. A temperature of about 50° by night, and 55° to 60° by day, will suit them. The plants are much benefited by fertilising moss being placed over the crocks in the pots.

FUCHSIAS.—Specimen and decorative Fuchsias are best placed out-of-doors in a sheltered place for a few weeks at this season, so that the wood may get matured, a few degrees of frost not hurting them. About the end of the month of October they may be taken indoors, and stowed away in sheds for the winter.

TUBEROUS BEGONIAS in pots that have not done flowering, if the space they occupy is required for winter plants, should be placed in a dry, warm house to complete their growth, but they will afford blooms for cutting for some time longer. A late vinery

suits them when the mature stage is reached. Afterwards they may be shaken out, and placed in boxes in a dry shed, from which the frost is excluded.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

SEEDLING ORCHIDS.—Cypripediums that were potted in thumbs and other very small sizes in the spring, and which have grown with vigour, will be benefited by being repotted into larger pots. Seedling Cattleyas or Lælias do much better if kept growing, these small plants not requiring the rest afforded established or older plants. The same remarks apply to Zygopetalum and Thunia seedlings, and such plants should be kept in a growing state until they can without injury be placed at rest. Seedling Dendrobiums, on the other hand, are very different, as these will now be furnishing their new pseudobulbs, which must be carefully ripened before the plants are removed to cooler quarters for a short period, and even then it is not safe to dry them, as may safely be done with established plants; they should have instead a short rest in a cooler temperature, and less water afforded. These Dendrobes will then start with growth strongly at the new year. Seedlings raised from seed sown during the last three or four months will scarcely have grown sufficiently to warrant their being removed to cooler places, but they may be kept in the warm-house until the very smallest node is quite finished; even then, during the winter much care must be taken, or they soon perish.

LÆLIAS.—*Lælia purpurata*, L. p. *Russelliana*, L. p. *Bryasiana*, L. *tenebrosa*, L. *grandis*, L. *xanthina*, should be grown at the warmest part of the Cattleya-house, the 5° to 10° more warmth suiting them exactly. I make it a practice of arranging all the Lælias which make new growth during the winter months near together, so that they may receive more humidity and more water at the roots, than the other plants. All of these above-named Lælias are growing freely, and the new growths are pushing new roots from the base, so that any check from lack of water would cause a shortening of the growth. Keep a sharp look-out in the evening for cockroaches and woodlice, which are fond of the thick fleshy roots of these species. *Lælia Perrinii* just pushing up their flower-spikes should lack water until the flowering is past, and only then may gradually drying-off begin, and this should not be so severe as to cause shrivelling.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

APPLES AND PEARS: ROOT-PRUNING.—To ensure fruitfulness in vigorous young trees of Apples and Pears, which are annually pruned, root-pruning may be requisite, and the earlier this is performed the greater will be the chance of obtaining a crop of fruit from them next season, as the check thus received will cause the imperfectly-formed bloom-buds to become more prominent, and develop into such blooms as will be more likely to set fruit. It must not, however, be expected that the best results will be seen the first season after this operation. The check given to the trees by preventing them making so much gross growth, induces the formation of bloom-buds, and when once a good set of fruit is obtained, trees can be kept in a fruitful state by allowing them to bear crops according to their condition, vigorous or otherwise. From the late discussion in the *Gardeners' Chronicle*, it was evident to me that anyone advocating root-pruning ought to describe fully the manner of performing the work, and so prevent the possibility of anyone receiving the impression that all trees which have not begun to bear should be thus treated. I am now advocating this treatment for trees which, from want of space or otherwise, are annually pruned to keep them within certain limits, which, in some gardens of limited area, include standard as well as bush, pyramid, espalier, and trained trees, and which pruning encourages the making of wood, which must be counteracted by root-pruning. Orchard standards, after the foundation is formed, should not receive further pruning, and although many of the shy-bearing sorts, such as Blenheim Pippin, &c., may not begin to bear for a few years, I would not root-prune such. In every orchard a proportion of such free-bearing sorts as Frogmore Prolific, Stirling Castle, Winter Hawthornden, Lane's Prince Albert, Northern Greening, Kerry Pippin, &c., should be planted,

which may be depended upon to come early into bearing. The root-pruning of standard trees too, would increase the difficulty of keeping such trees in the perpendicular.

METHOD OF ROOT-PRUNING, ETC.—Trees which may have been planted eight or ten years, and have grown to large size, should be root-pruned on one side only now, completing the work next season. Take out a trench at about 6 feet from the stem; should the trees be growing on free stocks, the trench must be wide enough to allow tunnelling underneath, as far as the stem of the tree, to make sure that no tap-root is missed. Prune back all the roots to 4 feet from the stem, making clean cuts, which will the more readily heal over. For younger trees, the work may be performed at one operation, and pruned back to 3 feet from the stems, being particular, as in the older trees, that no tap-roots are missed. Trees on the Quince and Paradise stocks do not root so deeply as when on the Pear and Crab stocks; but it is advisable to go deep enough to be satisfied that no roots are missed. Where the trees are growing in old gardens, and near where fruit trees may have previously grown, a portion of the soil should be replaced with fresh loam, a supply of which should be in readiness, as before advised. For trees on the Pear or Crab stocks, place the new soil nearer the subsoil than in the case of the Quince or Paradise stocks, which root nearer the surface.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

GENERAL WORK.—The work of the kitchen garden at this season of the year, if not so exacting as at other seasons, needs the exercise of judgment and forethought, as the success of another season depends to a great extent on what is now done. Falling leaves give much trouble, and the seeds of weeds germinate freely, so that there will be much to do for some weeks to come in getting rid of these and keeping the garden in a tidy condition. On all favourable occasions the hoe should be at work amongst growing crops, especially small plants, for an hour or two of sunshine will do much in killing small weeds. Weeds should never be allowed to accumulate and choke small plants. By keeping the ground clean, it will absorb and retain warmth, so that any late crops will make more progress. Manure, too, should be wheeled on to vacant ground before the soil gets too wet, as such work can then be more easily performed.

LETTUCE.—Continue to plant out seedlings for winter use, and it will not now be necessary to allow quite so much space between the plants. If planted in rows at 1 foot apart, and in such a manner that temporary protection can be placed over the plants, do not allow the plants to become too large before transplanting them. It is now too late to sow Lettuce-seeds, except in a frame, and this is hardly worth the while, as plants can be easily raised in heat.

ENDIVE.—Continue to transplant these as the plants become large enough on to a light dry position, where they will be less affected by frost. Blanch such as are required for use, taking care not to have too many ready at one time, as they soon decay after blanching.

PARSLEY must not be forgotten, for the sooner it is planted where it may stand the winter the better will it be. It is usually in February and March that this useful herb runs short, so that, planted with a view of being reserved till then, must be kept as hardy as possible till frost sets in, when protection with spare lights should be afforded.

POTATOS that are still in the ground should be lifted without delay.

VEGETABLE-HOUSE.—Where such places exist, independent of a Mushroom-house, for forcing Rhubarb, Seakale, and for blanching Chicory, Dandelion, and the like, it should be got ready for use. It would be well if all large establishments had some such place, so as not to be obliged to open the door of the Mushroom-house in which the blanching is done, so often. A Mushroom-house should be divided into two parts, the outer one being used for preparing vegetables for the kitchen, and forming a sort of passage to the other, which would prevent the ingress of cold winds when the door was opened. A Mushroom-house should be provided with close-fitting windows and shutters.

MUSHROOM-HOUSE.—Fresh material for beds should now be got ready to replace those that are exhausted. As sun-heat declines, great care will be needed in preparing the material for fresh beds. There is not the fear at this season of the manure getting too dry before being used, which existed in the height of summer, but a too great heat in the bed after it is made up must be guarded against, as this sometimes causes a too dry and spongy condition of the materials, which are therefore of little value for producing Mushrooms.

THE FLOWER GARDEN.

By T. H. CRASP.

The sudden low temperature of the past few days has told more or less on the appearance of the flower garden, and with the tree leaves falling at this early date, much work will be entailed in sweeping them up. Lawns will be much improved by a dressing of soot and loamy soil (free from weed-seeds) in equal quantities, sprinkled over bare places; but if bad places are large and many, it will be advisable to wait till the spring, and then lightly dig or scratch the surface with a rake, and sow a mixture of the best lawn-grass, covering it very lightly with rich loamy soil, patting it with a piece of board, or rolling it.

BEDDING PLANTS.—These, where struck in the open ground, should now be taken up, and potted or boxed; in all cases using a poorish sandy loam and sufficient drainage materials, especially if the plants are to be kept in pits and other places where a low temperature prevails in the winter. Continue to pot in dry weather layers of Carnations, Picotees, and Pinks. Be careful not to allow soil to get into the axils of the leaves of these plants, it proving detrimental to the plants during the winter.

BULBS.—All the early varieties of Tulip, Narcissus, &c., will soon be commencing to grow in store, and if kept out of the ground much longer they will be greatly injured. When it is impossible to plant them where they are to bloom owing to the summer occupants still being in possession of the beds, it is a good plan to place them on an inch or two of light sandy soil, and cover them several inches deep with Cocoa-nut fibre or half-decayed leaf-mould. In this the bulbs will make roots, and as soon as the beds are ready they may be planted with all the soil that will adhere to the roots.

VIOLETS.—The Violet plants which were prepared for framework should now be taken up with good balls of earth, and planted in the frames forthwith, so that they may have time to get established before winter. Plant them in rows in light fairly-good soil within 6 inches of the glass, and which soil should be put on a hard, porous bottom that will not sink lower. Let no row of plants come under the bearings of the lights; and before planting them, cut off every side-shoot. Having finished the planting, afford the plants a thorough watering, and should the weather be bright, shade them for a few days, admitting but little air; afterwards expose them fully in fine weather, airing freely at all times, when there is no actual frost.

HERBACEOUS BORDERS are still bright with *Anemone japonica*, *Michaelmas Daisies*, *Lilliums*, a few *Campanulas*, perennial *Sunflowers*, *Chrysanthemums*, *Liatris*, *Erigeron*, *Pentstemons*, &c., and the tidy keeping of these should receive attention. Pansy cuttings recently put in should be looked over, and decayed foliage removed. More cuttings may still be put in, as there is ample time for them to root and form plants by the spring. In the case of choice varieties of Pansy, it is a good plan to lift some of them carefully, and pot them in a rich light compost. They can be wintered in a cold frame in a dry, sheltered situation, if plunged to the rims in coal-ashes, and well-ventilated when the weather is mild. Dahlias requiring new labels should now be provided with them before frost destroys the blooms. This also applies to seedlings of desirable or marked character. Any offsets of *Auriculas* which may not have been ready earlier in the season, may now be removed, planting them carefully round the rim of a cutting-pot, and placing the pots in a situation free from all drip. Most evergreens may be moved or transplanted with safety at this season, and their propagation may be easily effected by layers or cuttings. New Ivy or Box-edgings may now be made.

EDITORIAL NOTICES.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited; but the Editor cannot be responsible for loss or injury.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

FRIDAY, OCT. 6—Dandee Horticultural Society.

SALES.

MONDAY,	OCT. 2	<ul style="list-style-type: none"> Bulbs, at Protheroe & Morris' Rooms. Plants, at Protheroe & Morris' Rooms.
TUESDAY,	OCT. 3	<ul style="list-style-type: none"> Orchids, at Protheroe & Morris' Rooms. Bulbs, at Protheroe & Morris' Rooms. Unreserved Sale of well-grown Nursery Stock at the Widdleham Nurseries, Bagshot, by order of Mr. R. Mason, by Protheroe & Morris (two days).
WEDNESDAY,	OCT. 4	<ul style="list-style-type: none"> Bulbs, at Protheroe & Morris' Rooms. Mr. W. Horne's Great Fruit Tree Sale at Perry Hill, Cliffe, near Rochester, by Protheroe & Morris. Bulbs, at Protheroe & Morris' Rooms. Plants, at Protheroe & Morris' Rooms.
THURSDAY,	OCT. 5	<ul style="list-style-type: none"> Special Trade Sale of beautifully grown Nursery Stock at the Wood Lane and Arboretum Nurseries, Isleworth, by order of Messrs. C. Lee & Son, by Protheroe & Morris.
FRIDAY,	OCT. 6	<ul style="list-style-type: none"> Orchids, at Protheroe & Morris' Rooms. Bulbs, at Protheroe & Morris' Rooms.
SATURDAY,	OCT. 7	<ul style="list-style-type: none"> Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—53°.9.

MR. IGGULDEN'S paper on the The Eucharis. "Culture of the Eucharis," read at the meeting of the Royal Horticultural Society on Tuesday last, is one that will be read with interest when it comes to be printed in the *Journal of the Royal Horticultural Society*. With most of his cultural details there will be a general agreement. The Eucharis is not a bulb which, judging from its native habitat and its structure, should be dried off, and the excessive forcing to which it is subjected is certainly calculated to depress the plant, and render it more subject to the attacks of parasites, whether insects or fungi; whilst pure water, meaning, as Prof. CHESHIRE pointed out, only oxygenated water, and water of the temperature of the house, are requisites. Mr. IGGULDEN'S remarks on the method of potting and the after-treatment were very judicious, and the leading requirements of the plant shown to be a sufficiency of moisture, a sufficiently-high temperature and shade, as might be inferred from the structure and appearance of the plant, and a knowledge of the climatal conditions under which it grows.

As to the oft-mooted question as to whether the mite is the cause or the consequence of the disease, opinions are still divided, though the majority of gardeners, we believe, are under the impression that perfectly-sound bulbs are not attacked. It is, indeed, true that a sound bulb if attacked may not greatly suffer, its strength

being sufficiently great to enable it to withstand the effects of the pest, and it is equally true that a weakly bulb will fall a prey to the mite or to the fungus much more readily than a healthy one should do. At the same time, we are perfectly convinced that the mite attacks healthy as well as degenerate bulbs. It is not generally known that the same mite attacks other bulbs, such as Roman Hyacinths and Narcissus. When, therefore, it gains access to a new and more succulent food-material, in a congenial temperature, it is no wonder it thrives and waxes fat. By and by, perhaps, it will get more accustomed to its new conditions, and the plant more accustomed to its attacks, a process facilitated by the gardener in eliminating the affected bulbs, and thus selecting the strongest.

At any rate, from our present knowledge and experience, we think it most likely that our successors will hear less of the bulb-mite than their predecessors did, and one way of securing this desirable end will be to keep the Eucharis bulb quite separate from any other bulbs of any kind.

The mite is not the only enemy to which the Eucharis and like bulbs are subject. The small red soft spots on the bulbs are often, if not always, associated with a kind of fungus, allied to the yeast fungus, and acting in the same way. This was pointed out in our columns some years since by Mr. GROVES, but whether it has any relation or not to the attacks of mites we do not know. It is quite possible that the two might co-operate in the enfeeblement of the bulb.

An end
to unlawful
Enclosure.

UNDER this title the *Times* of the 23rd inst. has a long article which will be read by all except land-grabbers with great joy and satisfaction. The "statute of MERTON," under the provisions of which encroachments were (legally) considered justifiable, under certain conditions, is no longer to be accepted as beyond appeal. In future no enclosure shall be made under its provisions without the sanction of the Board of Agriculture, and that sanction must be given on the ground of public not of private benefit. For a general enclosure, an Act of Parliament confirming a provisional order of the Board of Agriculture is necessary, but the enclosure of small plots and strips may be sanctioned by the Board of Agriculture alone, but only, as we have before said, on the condition that positive benefit will accrue to the public.

Notice of application to the Board of Agriculture for leave to enclose must be advertised in a local paper three months previously, and the Board will consider any objection made to it. "The inhabitants of a district will have themselves to blame," says the *Times*, "if they do not in future prevent the nibbling away of their common lands." The encroachment on commons and the appropriation of road-side strips, like the stopping of footpaths, are questions in which the general public is interested. It is to be feared that if the local residents were alone to be consulted, they would not sufficiently appreciate the nature of the loss they would sustain, or would be too apathetic and devoid of sufficient independence to protest against it. Notice given in the local papers may, therefore, not be sufficient to call attention to the proposal to make undesirable enclosures. It is unfortunate, too, from this point of view, that the presidency of the Board of Agriculture should be a political office. Let us trust, however, that the Board will take the broadest and justest view of the cases submitted to it.

It has taken twenty-eight years of costly

litigation and parliamentary struggle to secure this reform. Let us hope its value and permanence may prove commensurate with the pains exerted to secure it. It is to Lord THRING and the Commons Preservation Society that we owe the Act of Parliament which received the Royal assent on the 22nd inst.

MEEHAN'S *Monthly* for September gives a representation of a silver tablet presented to Professor MEEHAN by the inhabitants of Philadelphia, in grateful acknowledgment of his services in establishing small parks in the several sections of the city for the health and enjoyment of the citizens. Professor MEEHAN has recognised one of the greatest needs of our cities. When, some years since, we instituted inquiries for the purpose, we found that most of our larger, and, indeed, smaller towns were now provided with parks and recreation grounds on the outskirts, or at a short distance from, the towns. Of even greater sanitary importance is the establishment of numerous small areas (the larger the better!), dispersed through the crowded portions of our towns. An encircling girdle of parks and commons, broad, tree-lined boulevards, and a multitude of small open spaces appropriately planted and amply provided with seats, would do much to avert the progress of disease, and to fortify the inhabitants against its attacks should it unhappily occur, and under all circumstances would tend to make them happier, and therefore better citizens. There is, now-a-days, too great a tendency to let such things be undertaken by the State, the County Council, the local board, or the vestry, rather than by individual effort. Of course, the entire task is often too great for individual enterprise, but we would suggest that there is ample scope for the useful activity of private citizens. For instance, whilst we might appropriately look to the governing bodies to provide the land, lay it out fittingly, and secure its general upkeep out of the public rates, the duty of providing luxuries, such as floral decorations, ornamental fountains, statuary, or music should be furnished by the voluntary contributions of the people. Space, grass, trees, and fresh air are the primary requisites. Ornamentation, though very far from unimportant, is a secondary consideration. Professor MEEHAN has devoted years of energy and judgment to carrying out the desire of the founder of his adopted city, WILLIAM PENN, "That it may be a green country-town and always wholesome." It is to be feared that these conditions cannot now be fulfilled in their entirety in any large town, but that is all the more reason why as much as possible should be done in this direction. What Professor MEEHAN has done for Philadelphia is being accomplished for London so far as its means permit by the society over which Lord MEATH presides, whilst all credit must be given to the County Council and its predecessor, the Metropolitan Board of Works, for their successful attempts in securing large open spaces for the comfort and enjoyment of the people. Not longer ago than the middle of the century, it was asserted that trees would not grow in London, that any attempt to beautify the squares and provide recreation grounds was futile. Now, with a population enormously increased, and an area vastly greater, we find London a much more pleasant city to live in than it was then, whilst its sanitary condition is superior to that of any other city of its class in the world; and the still requisite task of sweetening, purifying, and decorating may be described as colossal.

CAMELLIA IN HER MAJESTY'S PARK AT OSBORNE, ISLE OF WIGHT.

CAMELLIA IN THE OPEN AIR AT OSBORNE.—The photograph from which our supplementary illustration was taken, was executed at the request of H. R. H. the Duke of CONNAUGHT, and represents one of the Camellias in the grounds at Osborne. It was, as we learn from Mr. COOLING, planted in 1847, and is now 6 feet high, and 48 feet in circumference. Some years since, HER MAJESTY ordered a canvas tent to be erected over the shrub when in bloom to protect the flowers from rain and frost. Its appearance in spring is very beautiful.

NATIONAL CHRYSANTHEMUM SOCIETY.—The next meeting of the General Committee will take place at Anderton's Hotel, Fleet Street, E.C., on Monday evening, October 9, at seven o'clock. On the termination of the ordinary business of the committee, Mr. CHARLES E. PEARSON, of the Chilwell Nurseries, Notts, will read a paper on "How to Improve our Chrysanthemum Shows;" and discussion will be invited.

THE "ORCHIDÉENNE" AT BRUSSELS.—Sir TREVOR LAWRENCE, Bait., has been elected President by this Society.

THE GARDENERS' ORPHAN FUND.—A large representative committee of gardeners of Kingston, Surbiton, and district, has been formed to promote a grand concert in aid of the Orphan Fund. It will take place at the Surbiton Assembly Rooms, on October 25, and Mr. W. FURZE, of Roselands, Teddington, the treasurer to the committee, has kindly undertaken to arrange the programme, which it is hoped will be of great excellence; a strong effort is being made and with considerable success, to secure a strong body of local patrons. Mr. A. DEAN, Richmond Road, Kingston, is the Hon. Secretary.

TESTIMONIAL TO MR. MANNING.—An influential committee has been formed for the presentation to Mr. MANNING on his retirement from Messrs. VEITCH, of some "slight testimony in recognition of his courtesy and invariable kindness to the fraternity." Mr. WYTHES of Syon House Gardens, Brentford, is the Treasurer, and Mr. JAMES HUDSON of Gunnersbury House Gardens, Acton, is the Secretary.

LECTURER ON HORTICULTURE.—A Cheshire correspondent writes: Mr. W. NIELD, formerly head gardener at Wythenshaw Hall, in that county, which post he has held for seventeen years, having resigned it, has been selected by the Cheshire County Council as Lecturer on Horticulture. He is an enthusiastic and successful gardener.

THE HORTICULTURAL COLLEGE, SWANLEY, KENT.—The Experiments Committee of the Kent County Council held a meeting at the Horticultural College on Thursday, September 21, to investigate the Strawberry plantations of English and North-American varieties. The next meeting is fixed for Thursday, October 5, when Professor F. CHESHIRE is to give a lecture on "Root-pruning of Fruit Trees."

A FAREWELL DINNER TO A BANK MANAGER.—It will doubtless be of interest to many country readers of the *Gardeners' Chronicle* to be made acquainted with the fact that on the occasion of the retirement of Mr. EZRA LIVERMORE from the management of the Covent Garden branch of the London and County Bank, a number of Covent Garden salesmen gave a dinner at Simpson's in commemoration of the event. Mr. LIVERMORE has been more than forty years in the service of the banking company, twenty of which have been passed at the Covent Garden branch, and his name, at the least, must be known to many of those doing business with market men. There were present at the dinner, Mr. COLEMAN in the chair, Mr. G. MUNROE vice-chair, Messrs. Hewett, G. C. Bond, Grake, H. Foord, T. Jay, E. Jacob, Stonewall Jackson, E. Coleman, J. Rouse, G. H. Walker, E. W. Cuthill, and C. Liddiard.

A FINE VARIETY OF TOMATO.—Two splendid bunches of Tomatoes were sent for our inspection by Messrs. JOHN CORBAN & SON, Market Place, Rother-

ham. The fruit is massive, without ribs, very solid, well flavoured, and with but few seeds. Of its productivity there can be no doubt. It was raised by the senders from a cross between Ham Green Favourite and Perfection, and it is said to excel both in the weight of fruit produced.

CONIFERS.—A systematic review of the genera of this order, by Dr. MASTERS, is given in the part of the *Journal of the Linnean Society*, published in August last.

M. ROMAIN DE SMET, a nurseryman of Ghent, well known to many on this side of the water, has lately been awarded by the French Government the Cross of the Order of the "Médaille Agricole."

THE KINGSTON AND SURBITON GARDENERS ASSOCIATION.—The following is the programme of lectures and discussions for the present autumn session. On October 3, "An Evening with the Begonia," Mr. JAS. MARTIN (Reading); October 17, discussion, "Is it desirable to have a Summer Show in Kingston and Surbiton?"—Opener, Mr. HAWKES; October 31, "Cliveias," by Mr. H. W. PITCHER; November 14, Discussion, "Forced Winter Flowers"—Opener, Mr. YEARSLEY; November 28, "Poinsettias," by Mr. J. MARTIN; December 12, "A Chat about Chrysanthemums," by Mr. H. J. JONES (Lewisham). The members meet on alternate Tuesday evenings at 7.30.

DAFFODILS.—These hardy bulbs are just now being planted again in immense quantities. Those who plant for permanence, no doubt find it difficult to understand the action of the great growers in lifting and replanting their immense stocks every year; but apart from the necessities of the dry bulb trade, which is still in Daffodils very extensive, the roots seem all the better for the lifting, drying, sorting, and replanting into fresh soil. At Mr. J. WALKER'S Ham Farm, Richmond, the ground is well prepared for the bulbs by manuring after early Peas, Potatoes, or other crops, deeply ploughed, harrowed, and rolled, to make it fairly firm. Then furrows are run out with a plough some 4 inches deep, the selected bulbs planted thickly in these furrows, which are about 10 inches apart, the throwing out of the next furrow covering up the preceding one. In the sheds, large numbers of small boxes are being filled with picked bulbs for forcing, this method alone absorbing tens of thousands of bulbs very quickly.

CHRYSANTHEMUMS.—An interesting example of the effect of sub-rooting of these plants when in pots, into enriched soil, as compared with the moderate growth of plants that have no such aid, may be seen at Mr. WALKER'S Ham Farm. Owing to the very large number of plants to be dealt with, and the pressure of work elsewhere at the time of final potting, the plants were stood out upon levelled ground that had been previously used for Seakale beds and alleys. Now that roots have gone through into the rich soil of the beds, the plants have very robust growth, and dark large leafage. With the plants standing on the alleys, the growth has been very moderate. None have had any top-feeding. It will now be interesting to see how far the stronger plants, when removed from their rich feeding ground, will be better in bloom than the others that have had no such assistance.

FLORAL DISPUTE AT HAWICK.—We have received from Mr. JOHN WOOD, Manager of the Hardy Plant Club, Woodville, Kirkstall, Leeds, the following letter:—"Owing to a communication I have received, I conceive it quite possible that your report of this case might be to my prejudice. I beg to say that I am not the JOHN WOOD referred to in the case, and in no way have any connection with it."

PERENNIAL LUPINS AS A BARRIER AGAINST FOREST FIRES.—According to a correspondent in *Moller's Deutsche Gärtner Zeitung* for September 25, the perennial species of Lupin, planted in suitable breadths, form a capital barrier against the spread

of fires in woods and forests. The plants succeed in almost any kind of soil, and require but little light and sun, and push constantly forth until the autumn new leaves, by which the spread of the flames is completely hemmed. The plants are likewise recommended for planting to improve the appearance of a landscape according to the ideas of PRINZ POCLEER MUSKA, much as we should use Broom or Furze, except that the colours blue and white of the flowers lend a beauty to the plant that is absent in the latter, and when seen in great masses they have a magnificent effect.

SALE OF ORCHIDS AT HAM GREEN, CLIFTON.—We have before us the catalogue of Orchids and general effects belonging to the estate of the deceased W. H. MILES, Esq., which were sold by auction by Messrs. ALEXANDER, DANIEL, SELF & CO., on Monday, September 25. Especial attention was drawn by the auctioneers to an uncommonly large specimen of *Paalenopsis amabilis*, with fifteen healthy leaves and three flower-spikes.

FURCRÆA FIBRE.—Mr. C. A. BARBER, the Superintendent of Agriculture, has issued a report on the plantations of *Furcraea* (would not *Fourcroya* be the preferable spelling?) in Antigua. Mr. BARBER considers the experiments to be so successful as to warrant further extension. The plant grown in Antigua is *Furcraea gigantea* var. *Willemetiana*.

THE BOTANICAL EXCHANGE CLUB.—Mr. G. CLARIDGE DRUCE, High Street, Oxford, has issued this report for 1892, which is very satisfactory as showing that the systematic study of our wild plants has still attractions for many in spite of the "laboratory" botany which now monopolises the time of the teachers and students. Among the notes we find one on a very interesting hybrid between *Senecio vulgaris* and *S. squalidus*, and appropriately named *S. Baxteri* ×. It should be remembered that *S. squalidus* transplanted from the dry oolite walls of Oxford to other soils, such as the moist clay of Middlesex, assumes a very different appearance. We cannot, however, say it approximates to *S. vulgaris*. The history of *Linaria repens* × *vulgaris* as given by Mr. DRUCE is also very interesting to those interested in the question of hybridisation, and the possibility of the genesis of a new race in consequence. The microscope will sometimes show the composite character of hybrids in a manner that cannot be disputed. *Quercus fœmina* of Miller it seems is a name which antedates the now generally-used *sessiliflora*. We think this is a case where the rigid application of the law of priority would be a calamity, although Miller's name should, of course, be always cited as a synonym.

A COSMOPOLITAN HORTICULTURAL SOCIETY.—Immediately following the Congress on Horticulture at Chicago, a movement was instituted to organise a general horticultural society to promote correspondence, the exchange of plants, seeds, books, and other articles, and the extension of fellowship among the horticulturists of the world. The organisation of this body was practically completed at a meeting held in Mr. SAMUELS' office on August 25. The scheme provides for three officers-at-large, president, first vice-president, and secretary-treasurer. Each country is entitled to a vice-president and secretary-treasurer. The three general officers, together with the secretary-treasurer of the country in which the president resides, constitute a committee on by-laws, and also on finance, while all the officers constitute an executive committee. The membership of the society consists of horticultural societies, which pay an annual fee of five dollars, and of individuals, who pay an initial fee of two dollars, and a subsequent annual fee of one dollar. Only the three general officers are yet determined; these are P. J. BERCKMANS, Georgia, President; HENRI L. DE VILMORIN, Paris, First Vice-President; GEORGE NICHOLSON, Kew, England, Secretary-Treasurer. It is expected that one-third of all moneys collected in each country is to be retained in that country for the expenses of its own branch of the work, the remainder going into the hands of the secretary-treasurer. *Garden and Forest*.

"A COMPANION FOR THE QUEENSLAND STUDENT OF PLANT LIFE."—This is a handy little book, comprising elementary notions on the morphology and classification of plants, and a glossary of botanic terms. In addition, the characters of a few specially selected natural orders and genera are given, suitable for the student preparing for examination. Of course, these illustrations are taken from the Queensland Flora, but the general principles are applicable in all countries. The author is Mr. F. M. BAILEY, the Colonial Botanist of the colony whose experience affords a sufficient guarantee of the accuracy and value of the little treatise.

A GIGANTIC SUNFLOWER.—Mr. EMMETT, gardener to Mr. WILLIAM HANCOCK, Wiveliscombe, has this season, says the *Devon and Exeter Daily Gazette*, grown some very fine specimens of SUTTON'S Giant Sunflower, one of which measured 12 feet in height and 9 inches girth around the stem; the flower was 20 inches in diameter. Many spring flowers are now again bursting into bloom, and a second crop of Strawberry is no rare occurrence, also Peas from the same haulm.

GRASS SEEDS FOR THE ROYAL PARKS, LONDON.—The contract for the year, to supply all the natural grasses required for sowing in the London Parks, has been again entrusted to Messrs. LITTLE & BALLANTYNE, the well-known firm of seedsmen and nurserymen, Carlisle.

MANURES.—When some years ago we caused analyses of some of the more-widely advertised manures to be made, and published the results, the general impression obtained was that most of the substances offered were good and efficient manures if properly used, and the only thing to be said against them was on the score of price, which was often excessive. There is always the danger of applying manures when they are not really wanted, of using a manure which, however suitable for one plant or crop, is of no service to another, or of using it at an improper season. There is a great objection also to the use of a manure of which the general nature is not made known. It is not necessary that the exact details of composition should be published, but the character of the manure offered should be made known. Messrs. H. & E. ALBERT fulfil these conditions, by publicly stating that their concentrated manure for horticultural purposes contains 14 per cent. of phosphoric acid, 12 per cent. of nitrogen, and 20 per cent. of potash. Such an announcement, which can readily be verified by any analytical chemist, would at once give confidence to a gardener conversant with the general principles of plant nutrition. It is hardly the season to make experiments now, but we may suggest that Messrs. ALBERT send specimens to Chiswick to be tried there in the usual way.

HORTICULTURAL SHOWS.—Reports have reached us of exhibitions at Glynde, Kelvedon, Bocking, and Witham.

NOTTINGHAM HORTICULTURAL SOCIETY.—An exhibition was held at the Arboretum on the 19th inst., in honour of the visit of the British Association to the town. A very large display was secured, and the exhibition was one of the finest ever held in the Arboretum.

TECHNICAL EDUCATION IN HORTICULTURE.—The Dundee Technical Institute classes in "The Principles and Practice of Horticulture," were resumed for the session on the 18th inst., when Mr. DAVID STORRIE, the lecturer for the advanced course, addressed prospective students. In the course of the lecture, Mr. STORRIE pointed out certain erroneous impressions which practical men often entertained with respect to theory, and subsequently dealt with some interesting facts in vegetable physiology.

SECOND CROP OF FRUIT.—The season is prolific of cases of fruits coming a second time on bushes and plants. Mr. COOP, gardener at Hensell, Hawkhurst, sends us some excellent red

Currants, of which he says he has twelve standard bushes carrying a full crop; also LAXTON'S Noble Strawberry, small but good.

EFFECTS OF THE SEASON.—As one effect of this extraordinarily sunny season, says the *Daily News*, Laburnum and wild Roses are in bloom again in some parts of the country. A dinner-table was decorated last week with Laburnum from a tree in the garden. In one instance a Cherry-tree, with some of the fruit still hanging on the branches, shows one side bearing fresh blossoms, which, if the warm weather continues, may develop into fruit, though it can hardly ripen at this time of the year.

CONIFERS.—One of the most complete catalogues we have seen, is that which has been lately republished from the *Bulletin* of the Royal Tuscan Society of Horticulture, by AVV. GIUSEPPE GAETA. It comprises a list of the species and varieties cultivated in the author's experimental plantations at Moncioni. The catalogue is based upon the *Genera Plantarum* of Benthham and Hooker, and the *Handbuch* of Beissner. Altogether, 400 species and varieties are enumerated. The list has evidently been carefully compiled, it is rich in the names of garden varieties, and it has a good index. It is interesting to note the approximately simultaneous publication of catalogues of Conifers in Germany (Beissner), Denmark (Hansen), Italy (Gaeta), and Great Britain (Report of Conifer Conference), and satisfactory to note the near approach to uniformity in matters of nomenclature that exists.

DOUBLE ACHIMENES.—A correspondent sends us a flower of an Achimenes, in which the calyx and corolla were in their usual condition, and within the corolla were a number of free-stalked and coloured petals. No doubt these represented stamens, but the flower was in so advanced a stage of disintegration that we could not satisfactorily determine the number or the relative position of these supernumerary petals. The stigma was three-lobed. We do not remember to have seen a double Achimenes before. If the variation could be fixed, a race of double Achimenes would doubtless find admirers.

SINGLE CACTUS DAHLIAS.—Messrs. DONNIE & Co., of Rothesay, send us a box of a new race of single Dahlias of the Cactus type, having relatively large, flat, starry flowers, very varied in colour. The ray florets are spreading, not overlapping, but with rather wide intervals between them, relatively narrow and obtuse at the apex. In colour they vary from white to yellow, various shades of lilac, red, crimson, and reddish-brown. Among the named varieties, Guy Mannering has whitish rays, yellow at the base, flushed with pale violet at the margins; Meg Merrilies is a clear yellow self; Ivanhoe has rosy lilac rays, with a crimson blotch at the base; Robert Burns has narrow rather pointed rays, of a rich reddish-purple; Highland Mary has bold oblong rounded rays, of a rich reddish-orange colour. Most of the seedlings are unnamed; from the samples sent, many of them seem quite equal to the named varieties.

VAN HOUTTE.—We learn from a communication to the *Journal des Orchidées* that on October 1 the VAN HOUTTE family will cease to have any connection with the celebrated firm which bears their name. It is difficult to think of Ghent without associating it with the name of VAN HOUTTE. The services rendered to horticulture in the importation, dissemination, and publication of new plants, in the furtherance of horticultural education, and in the raising of hybrids and improvement of cultural methods generally, are so great that the name and the firm will always hold a very high place in the annals of horticulture.

AWARDS AT THE WORLD'S FAIR, CHICAGO, SEPT. 22.—The following awards to British and colonial exhibitors have been made by the committee of the Floriculture Section: British.—Messrs. Laing & Sons, [Chinese] Primroses; Messrs. Carter & Co., [Chinese] Primroses, Cyclamen, and other flowers; Messrs. Kelway & Sons, [Chinese] Pri-

roses (model crimson); Messrs. Cannell & Sons, Primroses, &c.; Messrs. Waterer & Sons, collections of Pæonies and Phloxes; Messrs. Dickson & Sons, collections of Azalea mollis and Rhododendrons; Miss Margaret Dickson, collection of Roses. New South Wales.—The New South Wales Commission, photographs of a botanical garden, collection of Tree-Ferns, and various Ferns. Cape Colony.—Mrs. Ogilvie, floral church decoration; Government of Cape Colony, leaf specimens of everlasting flowers. The awards to foreign exhibitors are as follows: Germany forty-six, France twelve, Holland six, Austria one, and Italy one. *Reuter telegram in "Times."*

PUBLICATIONS RECEIVED.—NEWTON, *Dictionary of Birds*, part 2 (A. & C. BLACK).—*Kew Bulletin*, September.

BOOK NOTICE.

ORCHIDS OF SOUTH AFRICA.*

FOLLOWING his *Orchids of the Cape Peninsula*, which proved such a boon to the botanist and student of the flora of South Africa, and especially to the cultivator of Cape terrestrial Orchids, which now find favour in gardens, Mr. Harry Bolus, F.L.S., in his *Figures, with Descriptions of Extra-Tropical South African Orchids*, gives to the world a valuable work, the outcome of years of study and research, and one which has evidently been made a labour of love.

The plan of the work, of which this is the first issue, is that each of the species should be thoroughly dealt with, and coloured and analytical drawings given, a method which, as the author in the preface states, is the only satisfactory one with the majority of the subjects described. But, notwithstanding the presence of the illustrations, the descriptions in the letter-press, both in Latin and English, are given even to the most minute details, and the affinities and habitats of the species, and other interesting information, are appended.

Fifty coloured or partly-coloured (except four) plates are given, and they are remarkable for the careful drawing and depicting of what some might regard as minor features, but which are of the highest importance in giving a faithful representation of the plant. The colouring, too, is good, and not exaggerated. The subjects illustrated and described comprise *Disa*, 13 species; *Satyrium*, 6; *Habenaria*, 3; *Bulbophyllum*, 1; *Angracum*, 5; *Corycium*, 3; *Brownlea*, 4; *Disperis*, 1; *Eulophia*, 2; *Holothrix*, 3; *Liparis*, 2; *Pachites*, 1; *Platylepis*, 1; *Pogonia*, 1; *Pterygodium*, 3; and *Schizochilus*, 1. Of these nine are new species, viz., *Angracum caffrum*, A. *Mandæ*, *Habenaria Galpini*, *Satyrium Guthriei*, S. *ocellatum*, *Pachites Bodkini*, *Disa sabulosa*, D. *conferta*, and *Brownlea Galpinii*. Turning to the figures of the plants, we observe that some of the plants illustrated are in cultivation, although probably owing to our want of a proper knowledge of them—a want which it is one of the provinces of the present work to supply—it may be said of some of them, as it has been said of the members of the genus homo, "They are here to-day and gone to-morrow." *Liparis Bowkeri*, t. 2, and *Bulbophyllum Sandersoni*, t. 3, we have seen in flower lately; so also *Angracum sacciferum*, t. 10, *Habenaria Dregana*, t. 15, II. *tetrapetala*, t. 16, *Satyrium maculatum*, t. 19, and *Disa tripetaloides*, of which a new yellow form is illustrated at t. 30. *Disa sagittalis* has also flowered in gardens frequently of late, and has far more beauty than the illustration conveys; t. 37 gives a fine picture of the blue *Disa*, D. *graminifolia*, about which Mr. Bolus gives some particulars of its habitat, in the hope of its being able to assist in the cultivation of this desirable plant. Most of the grassy-leaved *Disas* have proved unsatisfactory under cultivation, as they merely grow, but very rarely flower. D. *lacera* (figured in the *Orchid*

* *Icones Orchidearum Austro-Africanarum, Extra-Tropicarum; or Figures, with Descriptions of Extra-Tropical South African Orchids*, by Harry Bolus, F.L.S. Vol. I., Part I. (London, William Wesley & Son, 28, Essex Street, Strand.)

album as *D. graminifolia*) has been the freest to bloom, and during one season we heard of its having bloomed in several gardens. Plate 38 illustrates the orange-scarlet *Disa ferruginea*, and t. 39 the similarly-coloured, but totally different in structure, *D. porrecta*, a very useful arrangement for comparison, as the names are confused in gardens. On t. 35, *Disa elegans*, Rehb. f., an illustration of a beetle found on it is given, with the following interesting remarks:—"Upon one of the flowers was found a beetle, *Peritrichia* sp., as my friend, M. Peringuey, informs me, belonging to a group of well-known fertilisers, and which had a pollinium attached to its thorax. This being only the second instance of an insect actually carrying Orchid pollen which I have seen during many years' study of Cape Orchids, I have thought it desirable to figure it with the plant."

The work is of great value to the botanist, and should be of great interest to gardeners, the plants which are treated of being those that are finding gradually the place in gardens that they deserve to occupy, and affording ample returns for the care bestowed upon them. For example, *Disa racemosa* and *D. tripetaloides* are now found to be very easily cultivated, and they have produced home-raised hybrids of fine quality—take, for instance, *Disa* × *Veitchii* and *D.* × *kewensis*—and doubtless the day is not far distant when other handsome species of the genus will be equally at home with us. The *Satyrums*, too, thrive remarkably well in cool sunny frames with some cultivators; but those who make greenhouse plants of them have but little success. For whatever purpose, however, the work under notice is obtained, we are sure that all who get this first part will eagerly look forward for its successors, which we sincerely trust its talented author will have leisure to elaborate.

PLANT NOTES.

AGERATUM BIJOU DE LYON.

This is by far the best white *Ageratum* that I am acquainted with—dwarf, compact, and free-growing up to the flowering period, after which, owing to its being such a profuse flowerer, that it is somewhat difficult to obtain cuttings for increase in August and September, that I find it advisable to pot-up a few of the plants every autumn to propagate from. Beds filled with this plant are veritable sheets of white, the individual flowers being large, and borne on shoots of uniform height. *Bijou de Lyon* is a capital companion in the flower garden for the *Tom Thumb Ageratum*, the latter being identical in every respect excepting the colour of the flower, which is deep mauve. *H. W. Ward.*

EDENHALL, PENRITH.

This place is the scene of the tradition upon which is based the German ballad of "Uhland," translated into English poetry by Longfellow, known as "The Luck of Edenhall." The "fairy fountain" is upon the lawn, surrounded by old Box trees, and still gives a supply of bright, clear water from the red sandstone rock. The enamelled glass vessel, "The Luck," is preserved as a heirloom in the hall.

The present hall is a modern structure of picturesque appearance, and becoming rapidly covered by various creepers. There is a large well-wooded park containing many fine deciduous trees, particularly Beech. The soil is mainly derived from the decay of the Penrith red sandstone, which comes to the surface in places. The most striking feature in the flower garden is the originality displayed in the planting of the flower-beds. Large beds of *Lobelia cardinalis* occupy prominent positions, the deep bronze of the foliage and bright scarlet flowers form a pretty contrast to the beds of pink Carnations. Two well-assorted masses on the terrace are made up of *Eucalyptus*, *Ricinus*, and *Nicotiana*, the terrace front having a high border containing pale Sun-flowers, *Dahlia*, *Cochineal*, *Heliotrope*, and the variegated *Polemonium*.

The glass-houses contain some fine Vines and Peaches, and also good specimen Palma and climbing plants; but the most noticeable feature here is the excellent lot of small *Crotona*, *Dracæas*, *Caladiums*, *Aralias*, &c., just large enough for table decorations. They are all propagated in the Cucumber and Melon pits, and look as well and strong as any nurseryman's collection, with this advantage, that when the houses are once free from such guests as mealy-bug and scale, there is less risk of their re-introduction when most of the plants are propagated on the place. Plants when two years old are just a nice convenient size for table decoration.

The growth of vegetables and fruit is here brought to a high state of perfection, neatness and cleanliness being the order of the day. *F. V. D.*

SYMMES' VEGETABLE COVER.

Our figure represents a Canadian invention which has recently been sent to the Imperial Institute as a means of introducing it into this country. That figured is about 12 inches high and 15 inches wide at the bottom, and it may prove useful for placing over Cauliflowers and Broccoli, or, indeed,

FIG. 64.—PLANT COVER.

any vegetable that requires temporary shelter from rain, wind, frost, or even sun. A much larger size, measuring about 3 feet at bottom, is used principally for protecting hay and corn from wind and rain after it is put up into "cocks" until such time as it is harvested. Both articles are made from a kind of wood pulp, which is afterwards twice saturated with a solution which renders them waterproof. They are very light, and are easily moved from one place to another. Anyone visiting the Institute may see both kinds in the Canadian section, when Mr. Watson the Curator will be pleased to give any particulars.

THE OLD HALL.

Here is the neat and compact garden of C. B. Powell, Esq., at Southborough, Tunbridge Wells, the raiser of that best and most ornate of hardy bulbous plants, *Crinum Powellii*. The garden contains more variety and more well-grown plants than many places of much greater extent, and while garden plants are being grown up to their best, a considerable amount of attention is given to improving the quality of many of them by cross fertilisation and experimental culture; and much success has attended the efforts put forth in that direction. *Lilias* are well and extensively grown; and among them the beautiful hybrid *L. Dal-hansoni* (*Martagon dalmaticum* × *Hansoni*), raised here, originally described in the *Gardeners' Chronicle*, and figured in *Garden*, Sept. 16, is certainly a great acquisition, and one which gives a reward for a considerable amount of trouble. Like most other home-raised plants too, it is a more robust grower than either of its parents, and has well-filled the bed devoted to it.

Hybridising the various species and varieties of *Gladiolus* is very extensively carried out, and with some remarkable results worth recording. *G. Saundersii* is a great favourite both for seed bearing and for crossing into other kinds; and among the other kinds the varieties of *G. Lemoinei* are

almost exclusively used, as they give the best results and the greatest variety. One reason why *G. Saundersii* is used for one of the parents, is that the progeny bear flowers which open well and hold up their heads and display themselves, and do not curve downwards as do most other crosses. The first lot we examined were a beautiful strain still occupying the four-light box in which the seed had been sown in the end of March, and managed as they are by Mr. Powell, the *Gladioli* commence to flower about twenty weeks after the seeds are sown. The method adopted to bring about this quick blooming is to make up a hot-bed in March, and cover it with as many frames as it is intended to fill. When the heat of the bed is nearly spent, at the end of March, a little soil is placed in the frames, and the seeds are thinly sown. In due time they come up, and are never disturbed until their flowering is over, when the best ones are marked, and stored away for planting in the open ground for the next season. After having examined the beauties of those in flower in the frames, which are rich in brilliant scarlet and in purple colours, we went to the plantation beside the orchard, and there found many beds which had some very fine things in bloom, but owing to the extraordinarily dry and hot season—which was doubly injurious on this light sandy soil, they were neither up to their usual quality nor had lasted in flower half so long as they had in previous years. Among other bulbs, *Watsonia iridifolia* O'Brienii, one of the finest of white *Irida*, is finely in bloom, and attempts are being made to cross it with some of the hybrids of *Gladiolus Saundersii*.

Begonias, too, have for years been worked on by Mr. Powell, and the quality of the strain, both double and single, is very fine; but the most striking seemed to be a dwarf, floriferous, crimson-flowered variety, a seedling of *B. Daviesii*, which is here used as an edging to the beds of other flowers, and for which it is well adapted. In the *Begonia* garden, the fine pyramidal *Yew* in the centre serves admirably to combine the various beds arranged around in one design.

In the elevated beds which border the winding walks, hardy herbaceous perennials are chiefly used, among them being planted bulbous plants for flowering at various seasons. In some places the edging was of hardy *Cyclamen*, which have grown to an immense size, and produce a great display of flowers. *Colchicum byzantinum* and the larger *C. speciosum*, too, were making a fine show, and the *Guillardias*, *Lilias*, *Campanulas*, *Montbretias*, *Celsia cretica*, *Heleniums*, *Menziesias*, scarlet *Lobelia*, perennial *Helianthus*, and other hardy flowers were making the best show they could in the face of the continued drought. Near the house was a beautiful screen of *Tropæolum speciosum*, which is such a charming plant when it thrives in that manner, but such a miserable object when it does not take to the place where it is planted.

THE ORCHIDS.

If there are any favourites here, where all plants are loved, the Orchids claim first place with both Mr. Powell, and his clever gardener, Mr. Dupont, who not only grows his plants well, but arranges them very effectively. The summer-flowering *Cattleyas* and *Odontoglossum vexillarium* had evidently made a good show, and the occupants of all the houses were in capital condition; indeed, much in advance of what they were when we last paid them a visit. The *Masdevallias* are still in the cold frame, where they will remain until frost comes. *Bletia hyacinthina* and some few other species were also outdoors, and the plants in the well-ventilated houses were being kept as cool as possible. In one house, in which were also some very finely-created *Gymnogramma Parsoni* and *G. Wetenhalliana*, *Odontoglossum grande* was flowering well, and so also *Dendrobium Draconis*, *Oncidium Jonesianum*, *O. Chollea*, *O. varicosum*, several very fine *Odontoglossum Harryanum*, *Peristeria elata*, with two spikes; many *Cattleya labiata* in bud, *Lælia cinnabarina*, with immense growths; *Miltonia spectabilis*, *Lælia pumila*, *Mormodes luxatum*, and various *Cypripediums*. In the next house the

Lycastes and Barkerias were thriving, the latter sending up spikes freely; and *Oncidium Janeiriense*, *O. tigrinum*, *Maxillaria venusta*, *Miltonia Clowesii*, had fine spikes; and various other species were in bloom. Here the *Pleione*, suspended near the glass, make grand bulbs, and flower very satisfactorily.

In the warm lean-to house the *Calanthes* are well-grown; *Dendrobium Phalaenopsis* var. *Schroderiana* and *D. Dearei* have put on good growths, the latter being of extraordinary vigour, and the *Angracums* and other warm-house Orchids seem to like the presence of the *Fittonias*, *Panicum*, *Tydas*, &c., grown or planted on the staging. Of the last-named *Tydas*, "Robert le diable" is a great beauty, with its scarlet flowers spotted with black.

In the fernery some very strong *Dendrobium Wardianum*, *D. crassinode*, &c., are resting; and in the other houses are many interesting bulbs and other plants not generally met with; indeed, every department of the garden is most interesting.

Of Apples and Pears there have been fair crops, Cob-nuts and Filberts a heavy crop, and fruits generally have been satisfactory, although many things in the kitchen garden have been the reverse. Among good crops we note some rows of American Wonder Pea which was sowed on July 23, and which were bearing well in the first week in September.

HOME CORRESPONDENCE.

CHRYSOGONUM VIRGINIANUM.—This "child of gold" has not yet become as popular as its pretentious generic name might lead us to expect. I can say, however, that no one who has not seen it before ever passes it in my garden without asking for a piece. It wants a moist, rich, open soil, and a rather shady situation, as most prairie plants do. If these are given to it, it flowers from May to November, the flowers becoming larger and more plentiful as autumn advances, without the plant becoming taller, as each flower-stem, 6 or 9 inches high is thrown up from the base. It makes a better show, in a small shady bed than yellow *Calceolarias* ever did, and gives less trouble. As for the name, Asa Gray says that Linnaeus derived it from two Greek words, meaning "gold knee," and that he cannot see the application. Of course he cannot, because *Chrysogonum* is a good classical Greek word, meaning "born of gold," and was applied by Dioscorides to some plant, but certainly not to the subject of this note. But centuries before the time of Dioscorides the word was used by the Greek poets as an attribute of the kings of Persia, who claimed descent from Perseus, the "son of a shower of gold," according to a fable of which all school-boys know both the circumstances and the moral. *C. Wolley Dod, Edge Hill, Malpas.*

THE ACORN CROP.—As the gardening journals preserve a record of the fruit crops each season, it may be interesting to record the extraordinary acorn crop already ripe in this neighbourhood. For size, abundance, and earliness of acorns the only year in which I can recollect anything like this was 1868; but in all these particulars the present season surpasses it. This year many branches have been broken by their weight, falling on quite calm days, and on many of the trees nearly all the acorns have burst their shells. On all the trees the lower branches are weighed down so that the cattle can reach them, and they feed on the leaves and fruits, not without dangerous consequences. One of my cottagers lost a cow last week from astringent effects of the Oak leaves. I enclose a few acorns from a large limb which fell yesterday across the road near my house. The acorns here generally set late and are of small size. Pheasants and wood-pigeons will find these a good mouthful. They weigh forty to a pound. *C. W. Dod, Edge Hill, Malpas.*

CHRYSANTHEMUMS.—Were I desirous of obtaining that form of immortality which is associated with floral names, I should prefer the incurred to the Japanese section of *Chrysanthemum*. Looking over the lists of selected twenty-four incurred, and the same of Japanese flowers, published in the Royal Horticultural Society's *Journal* after the *Chrysanthemum* Conference of 1889, I find that of the best of the former there has been since little change in popularity. Violet Tomlin would now stand much higher than twenty-third, and Miss A.

M. Ilagas higher than twenty-seventh. Also there would probably be admitted into the select twenty-four M. R. Bahuant, after last season's experience, and perhaps Robert Cannell; still the changes in popularity of the incurred section are few. On the other hand, how many of the eighty-five growers who voted in 1889 for the best twenty-four Japanese, would now put Madame C. Audignier at the head of the list? and of the leading twenty-four, would include other than perhaps E. Molyneux, which has yet a year or two longer to run—Avalanche, Sunflower, Elaine, J. Delaux, and Madame Laing? Of these, perhaps the most enduring are Sunflower and Avalanche. But what of all the rest? Mons. Bernard, Stanstead White, and Etoile de Lyon have all moved up appreciably since the list was prepared, but the far larger number will rarely be seen on showboards again. Vivian Morel, J. Stanborough, Dibben, Col. W. Smith, W. Tricker, W. H. Lincoln, W. Seward, Beauty of Exmouth, W. K. Woodcock, G. C. Schwabe, Florence Davis, White Louis Boehmer—these are but few of the best of to-day, and to be thrust aside for others a year or two hence. Such is floral nomenclature immortality. *A. D.*

RETARDED GROWTH IN TREES.—Referring to the note on the subject of retarded growth by your correspondent, Mr. H. D. Hearn, at p. 340, I have some experience of this peculiarity in trees after removal. A large tree of Pear Comte de Lamy was removed, and it was affected in exactly the same manner as that described by Mr. Hearn, but this same tree has annually borne a full crop of fruit ever since. Two years since, I moved an American Hickory tree, 6 feet high, this also remained dormant for a whole season. This spring it commenced to grow, and has now several shoots 1 foot long, and appears to be none the worse for its rest. *E. M.*

RETARDED GROWTH IN PEAR TREES.—It is not an unusual thing for a Pear or Apple tree to lay dormant the first year after planting or transplanting (see H. D. Hearn in the *Gardeners' Chronicle* for September 16). "H. D. H." appears to trace the cause of retarded growth to a matter that has been much discussed of late in these columns, viz., root-pruning. Now, my difficulty in our chalky soil is to start root-action, and not check it by the measures laid down by some of your contributors. My practice is to dig deeply outside a certain radius that is determined by the size of the tree, and chop off with a spade all tap roots met with, which, do what I will, persist, if left alone, in descending into the subsoil. By this operation, I leave the large body of roots undisturbed. The stock used for our Pears is the Wilding Pear, the soil at Glyndebourne being much too dry for the Pear on the Quince stock. *H.*

RANGEMORE, BURTON-ON-TRENT.—Upon a recent visit to the gardens of Rangemore, Burton-on-Trent, the seat of Lord Burton, there was to be seen one of the finest houses of Muscat of Alexandria Grape—probably one of the best in the country this season. The Vines are very old, but every year Mr. Bennett succeeds in obtaining a wonderful crop of grand bunches and large berries. All kinds of fruit is grown at Rangemore for private consumption, and under no circumstances is it ever exhibited, so that these grand bunches of Muscats will not be seen upon any exhibition table; if, however, this could be arranged, there is no doubt of the position they would take. Other varieties of Grapes are well grown, and those especially worthy of mention are Black Hamburgh, Gros Colmar, Madresfield Court, and the two new varieties recently put in commerce, viz., Appley Towers and Lady Hutt; these last two being fruited here for the first time this season, and are what the distributors describe them as being, that is, first-class exhibition Grapes—good in every way. In other houses there were observed a fine collection of Orchids in very robust health, and especially the *Cattleyas*, which were a grand lot; *Odontoglossums*, *Calanthes*, *Vandas*, and many other favourite genera. Rose growing is a specialty here, and at the present time a large houseful of thriving young Tea Roses in capital condition are being specially cultivated or early forcing purposes. Other houses contain quantities of *Bouvardias*, *Cyclamens*, and winter-flowering plants of all kinds in fine condition. Carnations of the *Souvenir de la Malmaison* varieties are grown in very large numbers, the plants being large, and quite free from the disease so prevalent among these plants. A good collection of winter-flowering Carnations is grown, such as Winter Cheer, Miss Jalliff Improved, Sir Henry Calcraft, &c. In spite of the very dry season, the grounds

are in perfect condition, although, of course, the amount of labour involved in watering such large areas has been very heavy. *H. J. C.*

POTTING UP BEDDING PLANTS FOR STOCK.—A sufficient number of any bedding plants of which the desired quantity of cuttings could not be obtained a few weeks ago, should be potted up forthwith for furnishing cuttings in the spring. Such, for instance, as varieties of *Verbena*, *Lobelia pumila* magnifica, *Ageratum* Bijou de Lyon and Tom Thumb. The plants should be taken up with a little soil attached to the roots, the latter being shortened back before being potted in well-drained $4\frac{1}{2}$ pots, and cutting off the flower-stems at the same time. A suitable compost consists of about three parts light loam and one of leaf-mould, free from worms, with a small quantity of sand added. Stand the plants in a frame or pit near to the glass, after affording water to settle the soil; keep close, and shade from sunshine until the roots have taken to the soil, after which, shading should be discontinued, and more and more air afforded by day for the next two or three months, to prevent growth being made before the early part of January. Care, however, should be taken to prevent the plants suffering from damp, or excessive dryness of the soil about the roots. *H. W. W.*

PREMATURE FLOWERING OF APPLE TREES.—The peculiar weather experienced this year is making fruit trees behave in a most extraordinary manner. I have twenty-five trees of Irish Peach growing in an open field, which carried a full crop of fruit that was gathered in July, and at the present time the bulk of these trees are freely flowering, nearly every leading shoot having a truss of bloom on it. I do not remember an occurrence like this before, although a tree here and there will blossom a month, or even two, out of the proper season, but the circumstance is not general. It will most likely interfere somewhat with the bloom of next season. *E. M.*

EARLY-BEARING OF A STIRLING CASTLE APPLE.—The following may be of interest to intending planters of fruit trees:—On the 4th inst. there were gathered here, from a small bush of Stirling Castle, planted two years ago, fifty Apples, weighing 24 lb. 15 $\frac{1}{2}$ oz., six of them weighing 4 lb. 1 oz. *Neil Sinclair, The Gardens, Park Hall, Salop.*

A SECOND CROP OF STRAWBERRIES.—Quite a nice second crop of Strawberries has been gathered from plants that were forced last spring, and planted out afterwards in an open sunny spot. The variety *Vicomtesse Héricart du Thury*, is one of the best for affording a second crop of fruit, as it also is in point of flavour. To-day, September 18, I saw some ladies in a railway carriage enjoying some really fine Strawberries; where they came from I know not, but the fact remains, that second crops are more general this season than some persons may suppose. *E. M.*

CHIONODOXA ALLENI.—The time having come round again when bulb growers will be giving their attention to this family, perhaps those who have flowered the above-mentioned variety will afford readers of the *Gardeners' Chronicle* their opinion as to its qualities. In autumn 1891, I received bulbs from the discoverer, and these flowered last spring. Some of the flowers were certainly finer than *C. Lucilia*, but I am waiting another season's blooming before giving my opinion. Amongst my lot has appeared a pale blue-flowered variety, very pretty; but whether it may be perpetuated I shall be able to tell better next season. *Pioneer.*

CATTELEYA GASKELLIANA.—In answer to enquiries by "W. W. & Sons," our Orchid correspondent, Mr. W. Holmes, writes as follows: "The treatment is that adopted by Orchid cultivators for *C. Mossia* and *C. Mendeli*. The best advice I can give him to get his plants to flower is to turn them clean out of their pots, and wash the roots quite clean. Perhaps the plants were potted when purchased, and turned out of one pot into another, with all the old soil potting material about them. In potting *Cattleyas* it is a mistake to put fresh materials around the ball without disturbing the old, as by so doing the pseudobulbs will soon turn black, and then die. As to present treatment, our plants receive no more water than is really required to keep them from shrivelling, and, having plenty of roots on the outside of pots, the moisture in the houses keeps them healthy. I would advise W. W. & Sons to put the plants in teak baskets, banging these close to the roof. *C. Gaskelliana* likes a temperature somewhat

warmer than *C. Mossiae* or *C. Mendeli*, but this cannot be the cause of the failure of the plant after the hot summer we have had; the plants should be quite dormant at this season, and no doubt would have been had they been healthy, and flowered at the proper time. If the plants have started into growth again, place them at the warmer end of the house, and encourage quick growth, then withhold water until the spring, when they will start into growth at the proper season. Our plants are dust dry, and have plenty of roots. *Odontoglossum nebulosum* should flower with the new growths, but the plants differ in habit of flowering to *O. citrosimum*. In *O. c.* the spikes appear nearly as soon as the new growth, but in *O. nebulosum* the new growth is partly made, or should be made, before the flower-spike appears. These should now be starting growth, and by the month of March or April the flower-spikes will be seen. *Odontoglossum nebulosum* should be grown in good peat and sphagnum moss, and when established, it should be afforded a plentiful supply of water. The temperature during the next six months should be 55° to 60°. Sometimes yellow thrips trouble this plant in a young state. If instructions on p. 11, July 1, 1893, be followed with regard to *C. Gaskelliana*, they will find the plants to grow and flower at the proper season. On January 14, 1893, p. 41, *Odontoglossum nebulosum* is mentioned, and recommended to be grown in the *O.*-Miltonia-house, where it does well, and makes fine pseudobulbs and flowers."

THE JARGONELLE PEAR.—With reference to the letter on Jargonelle Pears inserted in your paper on September 23, I remember when a boy at school in the weald of Sussex, a Jargonelle Pear-tree grew in the vicarage garden near a pond, the soil being a very stiff clay. I am not sure whether it bore much fruit, as the garden was forbidden ground. But your readers who have never read Smiles's work *The Huguenots in England and Ireland*, may like to know that those persecuted but industrious people were the first to introduce the Jargonelle Pear-tree into Portarlington, specimens of which still flourished there in 1876 in vigorous old ages. The planter was an ensign who fought at the Boyne. The immigrants also successfully introduced the "espalier." *John Colebrooke.*

MADRESFIELD COURT GRAPE RIPENING OUT-OF-DOORS.—It may prove interesting to readers of the *Gardeners' Chronicle* to learn that a Vine of Madresfield Court has ripened a good crop of Grapes out-of-doors this year, the bunches and berries being of fair size, and beautifully-coloured. The Vine in question was planted three years ago, together with a Vine of the Royal Muscadine, against the south side of the chapel tower of Longford Castle. A hole large enough to hold about 3 bushels of a compost consisting of about four parts sound loam and one of old lime-rubble was made in the concrete underneath the flagged space at the base of the wall, a hole having been cut in one of the flags for the stem of the Vines. I need hardly say that the Vine had been afforded plenty of water at the roots during the past and two previous summers. The Vine is free from mildew, and is otherwise in good condition. There are still (September 25) several nice-sized bunches of well-coloured Grapes of excellent flavour on the Vine. This Vine bore several bunches of Grapes last year, but they did not finish up anything like so well as this tropical season. Royal Muscadine has also ripened a good crop of Grapes on the same wall, but there is nothing remarkable in this fact, seeing that it is the recognised and most likely variety of Vine to ripen its fruit out-of-doors in ordinary summers. *H. W. Ward.*

ASH-SHOOTS BARKED BY HORNETS.—I send for your inspection a few sections of this year's growth of some young Ash trees that have been barked by hornets, which I thought as somewhat unusual and worthy of notice. The hornets are followed by wasps, blue-bottle flies, and butterflies, all of them appearing to derive some sort of nutriment from the already barked shoots. The trees have been planted three years, and their average height is 7 feet. The damage is chiefly confined to a small area, where growth is vigorous. As many as four hornets have been found at work together on one shoot. *William Low, Euston Garden, Thetford.*

FICUS ELASTICA.—A small plant of the above, about 4 feet high, is bearing fruit at this place. During the time that I served under Mr. Ellam, gardener, Bordorgan, Anglesea, it was nothing unusual

to have plants of *F. Parcelli* in fruit, but I never remember seeing *F. elastica* in fruit before. *C. Watkins, Glyndebourne, Lewes* [We have occasionally seen it, and it has been figured in our volumes. Ed.]

FRUIT NOTES.

PLUM BELLE DE LOUVAIN.—This is a culinary variety of Plum which receives less attention from cultivators than its merits deserve. Coming into use early in the month of August, its fine appearance renders it a far more remunerative fruit at that time than the finest Denyer's Victoria. The fruit is almost double the size of that favourite Plum, while the flavour is quite good for a kitchen Plum. It succeeds admirably in the open, especially in soil that is inclined to be sandy. *E. M.*

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 26.—The show on Tuesday last at the Dill Hall, James Street, Westminster, was a good one. Large exhibits of Dahlias and other seasonable flowers, a few Orchids, and a good collection of fruits and vegetables, formed together an exhibition above the average, besides which there were several novelties in plants and in Orchids.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. H. Herbet, R. Deau, G. Stevens, C. F. Bause, C. J. Salter, J. D. Pawle, C. Jefferies, E. Mawley, H. Cannell, H. H. D'Ombain, H. B. Williams, C. Noble, and P. Barr.

Messrs. J. Cheal & Sons, Crawley, contributed a large collection of cut Dahlia blooms, representing each section. Crawley Gem is a very bright Cactus variety, rather small, but exceedingly bright. A large new variety is Duchess of York. It has good form, and the colour is a reddish-buff, the young petals are quilled, and although the petals are not so tapered as they might be, it is a good flower. Beauty of Eynsford, Sir Francis Montefiore, Kaiserin, Delicata, and many others of the well-known Cactus sorts were shown, besides a good display of show, single and Pompon varieties (Silver Flora Medal).

Another very fine lot was from Messrs. Keynes, Williams & Co., Salisbury, and they were well put up in the shape of pyramids and in boxes. A seedling show variety called Duchess of York, a good flower of rose and bronze, obtained an Award of Merit. The same distinction was given to Grand Duke Alexis, a large double decorative white—the petals are very broad and folded; and also to a Pompon named Ceres, and another called Sovereign. The collection contained many of the best varieties in each section, Bertha Mawley, a lovely violet-crimson flower, being in very good form; also the beautiful Lady Penzance, one of the best yellows ever sent out (Silver Flora Medal).

Messrs. H. Cannell & Sons, Swanley, had a group of Begonia flowers in sprays. A single one, called Fashion, is a good bronzy-yellow, and was well shown; a few double varieties were also shown (Silver Banksian Medal).

From Messrs. Pitcher & Maada, The United States Nursery, Hextable, Swanley, Kent, came a plant of *Datura cornucopia* (Horn of Plenty). It has a double flower, about 5 inches or more across the top of corolla. The exterior of corolla and petals are lilac, and the interior white, except so far as it is influenced by the lilac showing through, which has a tendency to make it appear heliotrope. The plant seems to be free-flowering and dwarf, and dense in habit (First-class Certificate).

Mr. Anthony Waterer, Knapp Hill Nursery, near Woking, had some plants of *Cedrus atlantica glauca*, *Andromeda japonica*, and *Picea pungens glauca*. Both the Conifers were decidedly glaucous, and quite distinct from the types (Silver Flora Medal).

G. P. Harris, Esq., Scad's Hill House, Orpington, Kent, showed four seedling Dahlias of the show section. Cherub, a bronzy yellow variety, obtained an Award of Merit.

Mr. R. Owen, Castle Hill Nursery, Maidenhead, contributed bloom of *Chrysanthemum Vigilant* and *Canna Comtesse O. de L'Estrole*, but no award fell to either of these. A few plants of *Fuchsia triphylla carminata alba* were from Mr. H. J. Jones, Ryecroft Nursery, but the variety is no improvement upon the type.

A stand of excellent new Dahlias, show and fancy, was shown by Mr. C. Turner, Slough, those receiving Awards of Merit being Mrs. Morgan, a fine show variety of tender purplish-pink, and creamy-white centre, florets tipped with purple; it resembles the older Maud Fellowes. Another was Norma, of an orange tint, with bold well-formed florets, a grand flower (Award of Merit); lastly, Octavia, a sulphur-yellow bloom with carmine tips (Award of Merit). Very nice blooms were Penelope, light purple with tips of a darker shade; and Esmond, a rich crimson. Edith Turner is a rich crimson Cactus variety, that received an Award of Merit. Five diverse lots of Pompon Dahlias came from this exhibitor; Miranda, a sulphur-yellow tipped with purple; and Captain Boyton, a very dark purple, almost black, received Awards of Merit.

Some excellent *Gladiolus* were shown by a new exhibitor, Mr. J. C. Fordy, Warkworth, Northumberland. For two dozen of fine large spikes, finely developed, not alone for a place so far north, but for any part of the country, he received a 1st prize. Numbers of the spikes were from 15 to 18 inches in length, especially fine being Atlas, Corinne, Formosa, and Dalila.

Messrs. John Laing & Son, Forest Hill, S.E., showed a group of stove plants, *Cannas* in bloom, &c. Of *Crotons* shown the more novel and striking in colouring were Miss Lucienne Linden, a plain leaf, 8 inches long, yellow and green; C. Marquise de Guadiara, a plain pointed leaf, green, crimson, and yellow, leaf-stalk and stem of bright red; C. Princess of Waldeck, pretty leaf of yellow and green; C. Mr. Bause, and C. Challenger. Another good plant was *Alcaasia Chantrieri*, resembling *A. Sanderiana*, but having a less divided leaf, the general colour being much like that fine variety (An Award of Merit).

Mention may be made of *Urceolina pendula*, *Nicotiana colosea variegata*, a plant with white and green leaves, which has the merit of coming true from seed; *Guzmania tricolor*, a spike 1 foot high, with scarlet bracts and white blossoms; the beautiful *Tillandsia Lindenii*, in spathe, but without open blossom; *Vriisia pittacina*, *Caraguata cardinalis*, &c.

Mr. A. Rawlings, of the Dahlia Nursery, Romford, showed six dozen of show and fancy Dahlias, excellent examples of well-known varieties (Silver Banksian Medal).

Mr. T. Ware, Hale Farm Nurseries, Tottenham, N., showed stands of Pompon, Cactus, and single Dahlias. Cactus Dahlia Mrs. A. Peart and Pompon Florence Woolward received Awards of Merit; the former is white, and the latter sulphur-yellow, with crimson-tipped florets.

An unusually fine exhibit came from Mr. B. Ladhams, The Shirley Nursery, Southampton; it consisted of hardy perennials of species and varieties not often seen—at least, in such fine condition—at London shows. Mention should be made of the following:—*Coreopsis monstrosa*, a flower wholly rich yellow; *Helenium pumilum*, *Helianthus multiflorus major*, *Astrantia carniolica*, white and pink, a little less colour than in *A. Biebersteinii*; *Lychnis vespertina*, white; *Bupthalmum salicifolium*, yellow; *Erigeron macranthum*, *Gaillardia picta*, *Helenium autumnale grandiflorum*, *Dracocephalum speciosum*, purplish-rose; *Liatris pycnostachia*, with spikes 2 feet long, of rich purple flowers; *Erigeron philadelphicus*, *E. speciosum superbum*, with lilac-coloured flowers; *Saponaria caucasica*, rose-coloured; *Tritoma MacOwani*, *Funkia grandiflora*, *Pentstemon*, *Belladonna Lily*, *Helianthus orgyalis*, yellow rays and a brown disc; a beautiful full-flowered new perpetual-flowered Pink, Ernest Ladhams, generally of the colour of Anne Boleyn Pink, but larger and fuller; Perfect Pink Lizzie Duval, rosy-purple and full; *Heliosis scabra major*, of a distinct type in its larger flowers, which have a width of 3 inches—the height to which it grows is 4 feet (Award of Merit). For the whole group, a Silver Flora Medal was awarded.

Mr. A. Waterer, Knapp Hill, Woking, had a stand of their new *Spiraea Anthony Waterer*.

Messrs. J. Veitch & Sons, Chelsea, showed a large basketful of plants of *Amasonia punicea*, the blooms well shown up by some plants of *Phrynium variegatum* mixed amongst them; *Aglaonema rotundum*, a plant bearing a certain resemblance to a *Dieffenbachia*, but dwarfier than any of those, and with shining leaves of two shades of green, and leathery consistency (First-class Certificate). *Veronica hybrida Purple Queen*, came from the same exhibitors; it is a fairly hardy, bushy, dwarf plant, very floriferous, flowers dark blue, and leaves 1 inch long, by $\frac{3}{4}$ inch in width (Award of Merit). They showed a *Nepenthes mixta*, with six pitchers, of a reddish

colour, and 7 or 8 inches deep, the wings are bristly, the margin of the orifice deep crimson, striated, and shining; operculum green, strewn over with minute dark spots (First-class Certificate). A plant of *Anthurium Londinense* came from Messrs. B. S. Williams and Sons, Holloway, it carried one spathe. Messrs. Hugh Low & Co., Clapton, showed the distinct and showy *Lilium nepalense*.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. J. O'Brien (Sec.), Dr. M. T. Masters, Rev. E. Handley, T. B. Haywood, Sydney Courtauld, J. Douglas, E. Hill, C. Pilcher, and T. W. Bond.

There was a more than usually interesting show of Orchids, but by far the most novel and beautiful exhibit was a plant of *Cypripedium Charlesworthii*, Rolfe (First-class Certificate), an entirely new species, imported by Messrs. Charlesworth, Shuttleworth & Co., of Heaton, Bradford, and exhibited by them for the first time, the exhibit coming in for a very great amount of attention and admiration. The plant in growth somewhat resembled *C. Spicerianum*, and the flowers, which are borne on scapes about 3 inches in height, are unlike any other known species. The beautiful flat upper sepal is $2\frac{1}{2}$ inches wide, broadly orbicular, white, tinged and veined over its surface with light rosy-purple, the apex alone showing a white marbling. The lower sepals are about lynch broad, greenish-white. The petals, which resemble those of *C. insigne*, are plain-edged, over $1\frac{1}{2}$ inch long, yellowish tinged with brown; the lip also somewhat resembles that of the Sylhet form of *C. insigne*, and is similar in colour to the petals. The staminate is very singular, resembling pure white porcelain, the protuberance in the centre being conical in form, and not a simple spur, as in *C. insigne*. It is an extraordinary and beautiful species. Messrs. Charlesworth & Co. also exhibited in a small group *Cypripedium Spicerianum*, *C. x Euryandrum*, *C. insigne Wallacei*, *C. tonsum*, *C. x Morganii*, *Lælia tenebrosa*, *Vanda cœrulea*, *V. Sanderiana*, &c. (Vote of Thanks).

Messrs. F. Sander & Co., St. Albans, exhibited a select group of Orchids, in which were *Calanthe curculigoides*, a rare yellow-flowered species; *Dendrobium Fairfaxii*, *Aerides Rohanianum*, *Coleogyne ocellata maxima*, some fine *Oncidium Jonesianum*, *Cattleya anrea* in variety, *Oncidium cornigerum*, *O. bracteatum*, *O. trulliferum*, *Catasetum purum*, varieties of *Dendrobium Phalaenopsis Schroderianum*, the pretty *Lælio-Cattleya porphyrites*, with light rose-coloured flowers, the front and tips of the side-lobes of the lip being purple. The firm likewise showed a singular-looking hybrid, *Lælia x Sanderæ* (*xanthinum* ♀, *Dormaniana* ♂), whose single flower partook much of the characteristics of *L. xanthinum*, the sepals greenish-yellow, lip white, with a flat dark rose-coloured front lobe (Vote of Thanks).

A group of Orchids was shown by Messrs. Hugh Low & Co., consisting of *Cypripedium bellatulum*, *C. x Harrisianum*, *C. tonsum*, *C. x marmorophyllum*, *C. x Seegerianum*, *C. x picturatum*, *C. x Brayuanum*, and the singular *Phalaenopsis violacea bellina* (nearly white flowers), *Cattleya maxima*, *Vanda cœrulea*, &c. (Vote of Thanks).

Thos. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), again showed the pretty *Cattleya x Parthenia*, the singular *Cattleya bicolor cœrulea*, with a slaty-blue front to the lip; a good form of *Cattleya Alexandræ*, and *Cypripedium Anthurium superbum*.

From Messrs. W. L. Lewis & Co., Chase Side, Southgate, came two hybrid *Cattleyas*, each of which was obtained by crossing *C. Harrisianæ* with *C. gigas Sanderiana*. That named *C. x Johnsoniana* had flowers resembling those of a small *C. Schroderæ*, and with but a small amount of colour in the lip; the other named *C. x Ashtoniana* was of the same form as the former, but the front of the lip was of a rich velvety-crimson colour. This firm also sent a neat form of *Cattleya Loddigesii* named *C. L. Pugetiana*.

W. Thompson, Esq., Walton Grange, Stone, Staffordshire (gr., Mr. W. Stevens), sent spikes of several varieties of *Cattleya Alexandræ*, the best which have yet been shown, one variety with a metallic-bronzy hue over the segments, being especially distinct (Vote of Thanks).

W. E. Brymer, Esq., Ilington House, Dorchester, sent a fine spike of *Cattleya Brymeriana*, which received a First-class Certificate in May, 1889.

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N., in *Lælio-Cattleya x Bleensis* (*C. Loddigesii* ♀, *L. pumila*

Dayana ♂), showed a very pretty, free-growing, profuse-flowering and interesting hybrid. The plant has the stature and free growth of *C. Loddigesii*, but with brighter green leaves. The flowers, which are larger than those of *C. Loddigesii*, are produced in threes and fours, the sepals and petals rosy-lilac, and the crimped front and edges of the side lobes of the lip rich dark purple (Award of Merit).

Messrs. B. S. Williams & Son also showed *Cypripidium x Cythera* and *C. x Amandum*. Walter Cobb, Esq., Dulcote, Tunbridge Wells (gr., Mr. J. Howes), showed a well-flowered plant of the singular *Catasetum Gnomus* (Botanical Certificate). Messrs. Pitcher & Manda, United States Nurseries, Hextable, Swanley, Kent, showed *Cypripedium x radiosum*, Short Hills var.

Mr. P. McArthur, The London Nurseries, Maida Vale, staged a small group of Orchids, among which were *Vanda Sanderiana* and *V. S. pallida*, a fine variety of *Cattleya Loddigesii*, two fine plants of *Coleogyne Massangeana*, some good *Odontoglossum crispum*, *Oncidium Jonesianum*, and hybrid *Cypripediums* (Vote of Thanks).

E. Ashworth, Esq., Harefield Hall, Wilmslow, Cheshire (gr., Mr. H. Holbrook), showed four distinct varieties of *Dendrobium Phalaenopsis Schroderianum*, that named "Ashworthia" being almost pure white; *D. P. S. var. Beatrice Ashworth* was a charming variety, with several spikes, the sepals pure white, the petals tinged with rose, and the lip white and crimson. The plant was well grown, and a Cultural Commendation was awarded.

C. L. N. Ingram, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), showed the fine *Lælia elegans*, Ingram's var., of the "Turneri" section, and on which the late Professor Reichenbach commented in the pages of the *Gardeners' Chronicle* as being a distinct variety of the old importation. The flower is of the largest of its class; the petals broader and more flat than other varieties, but the chief feature is the large and long front lobe of the lip, which is of a glowing crimson colour (Award of Merit). Mr. Jas. O'Brien, Harrow-on-the-Hill, showed *Satyrium membranaceum*, and *S. eriocarpum* very strongly grown; and the pretty light blue and spotted *Brownleea cœrulea*, which is figured in Bolus' new work on African Orchids (Botanical Certificate).

Fruit Committee.

Present: P. Crowley, Esq., in the chair; and Messrs. J. Lee, G. Bunvard, G. Goldsmith, G. Taber, J. T. Saltmarsh, W. Warren, J. Wright, A. Dean, A. H. Pearson, J. A. Laing, G. H. Sage, G. Reynolds, W. Iggulden, G. Wythes, J. Hudson, W. Balderson, J. Smith, R. Hogg, W. Wilks, Harrison Weir, H. J. Pearson, and J. Cheal.

Mr. Owen Thomas, The Royal Gardens, Windsor, sent eighteen capital fruits of Pine-apple, some of the Smooth Cayenne weighing as much as 9 lb.; also a few fruits of *Cydonia japonica*, sometimes used for preserving (Silver-gilt Knightian Medal).

The Earl of Cork and Orrery, Marston House, Frome, Somerset (gr., Mr. W. Iggulden), exhibited a collection of Pears, the weight of some of them being affixed to the dish. Five fruits of *Burré Clairgeau*, for instance, weighed 4 lb. 12 oz. The heaviest fruit of *Burré Rance* was 13½ oz. Five fruits of *Pitmaston Duchess* were 5 lb. 15 oz. (not exceptional), the same number of fruits of *Van Mons. Léon Leclerc* being 4 lb. 6 oz. *Duchesse d'Angoulême* was not extra large, five fruits weighing 4 lb. 2 oz., whilst *General Todleben* was 5 lb. The heaviest fruit of *Glou Moreceau* weighed 14½ oz. (Silver Knightian Medal). The same exhibitor had a dish of excellent *Doyenné du Comice Pear*, which was awarded a Bronze Banksian Medal.

From the Dowager Lady Freake, Fulwell Park, Twickenham (gr., Mr. A. H. Rickwood), came a collection of Apples and Pears in seventy dishes (Silver Banksian Medal).

Messrs. H. Cannell & Sons, Swanley, staged an excellent collection of vegetables, including almost all kinds now in season. Onions were nice clean samples of *Ailaa Craig*, *Cannell's Globe*, *Anglo-Spanish*, *Improved Wroxton*, *Rousham Park Hero*, and *Somersetshire Hero*. There were nice young Cabbages, *Leeks*, *Marrows*, *Savoys*, *Red Cabbage*, *Autumn Giant Cauliflower*, *Carrots*, *Cannell's Intermediate*, *Cannell's Improved Shorthorn*, and *Cannell's Improved Nantes*, *Beet*, *Turnips*, *Parasuis*, *Salsafy*, *Beans* (*Runner* and *French*), *Tomatos*, *Peas*, *Artichokes*, *Stachys tuberifera*, and *Shallots* were also included. A few *Brusels Sprouts* were very early and in capital condition, having Sprouts ready for the table on stems at least 2 feet high. Mr. Cannell

obtains early Sprouts by sowing part of the crop in the autumn, and his seed for next season's plants is already sown. This system he very strongly recommends, as being the means of securing Sprouts ready for table in September. Also a collection of Potatoes of good size and quality, although a little rough-looking, perhaps from the fact of them having been grown in fainty soil; also about forty dishes of Apples (Silver Knightian Medal).

The Messrs. de Rothschild, Gunnersbury Park, Acton, W. (gr., Mr. Reynolds), contributed twenty fruits of Melons, all very fine well-grown fruits, mostly seedlings. Three of the finest were from a cross between *Triumph* and *Hero of Lockinge*; the largest of these fruits weights 10 lb. 2 oz. (Silver Banksian Medal).

From J. Nix, Esq., Tilgate Manor, Crawley (gr., Mr. Dibben), came a collection of Pears in about thirty dishes (Silver Banksian Medal).

Sir E. Loder, Leonardslee, Horsham (gr., Mr. Goldsmith), showed a dish of *Pomegranates* (Vote of Thanks). Mr. Jno. Chinery, The Gardens, Downton Castle, Ludlow, had a fine collection of fruit. His Apples, *Mère de Ménage*, *King of the Pippins*, *Cox's Orange Pippin*, *Ribston Pippin*, *Alexander*, and his Pear *Marie Louise* were very good, also half-a-dozen dishes of Plums, and a collection of Onions (Silver Banksian Medal).

W. H. Evans, Esq., Forde Abbey, Chard, Somerset (gr., Mr. John Crook), sent some Apples and Plums; his *King of the Pippins*, *Cellini Pippin*, *Cox's Orange Pippin*, and *Striped Beefing* were large and good. The only award granted by the committee on this occasion was to an American variety of Apple called *Wealthy*, and exhibited by Mr. Molyneux, Swanmore Park Gardens, Bishop's Waltham; it is of good size, well-coloured, and soft flesh, suitable for table, but strictly speaking a culinary Apple (Award of Merit).

Seedling Melons were from *Jas. Lye, Esq., Cliff Hall, Market Lavington, Wilts.*, and from *Sir Jno. H. H. Amory, Knightshayaes Court, Tiverton, Devon* (gr., Mr. Grigor).

GARDENING AND FORESTRY EXHIBITION.

SEPTEMBER 27, 28 and 29.—The last of the special exhibitions was opened on Tuesday last. The schedule was devoted entirely to fruit and vegetables, and the show was the best that has been held here during the season. The competition was wonderfully keen, and in Pears and Apples especially the judges had very difficult work. The competitive exhibits completely filled the usual tent, and there was a great quantity of non-competitive produce in the main building.

Open Classes.—In the first class for twenty-four kinds of dessert Apples, Messrs. Geo. Bunyard & Co., The Old Nurseries, Maidstone, were 1st, with very fine fruit of capital colour, *Cox's Pomona*, *Worcester Pearmain*, *Blenheim Orange*, and *Swedish Reinette*, were the prettiest dishes. The 2nd place was taken by Mr. H. Berwick, Sidmouth Nurseries, North Devon, who included good dishes of *Blenheim Orange*, *Wealthy*, and *Jefferson*; Mr. Jno. Scott, The Royal Nurseries, Merriott, Somersetshire, was 3rd.

Messrs. Bunyard & Co. were again adjudged 1st for a collection of culinary Apples, in forty-eight dishes (distinct). The best of this collection, which was of first-rate merit, were *Cox's Pomona*, *Lane's Prince Albert*, *Newton Wonder*, *Tyler's Kernel*, *King of Tomkins County*, *Gascogne's Seedling*, and *Striped Beefing*. Mr. Geo. Woodward, Barham Court Gardens, Maidstone, was an excellent and close 2nd; his *Peagood's Nonsuch*, *Cox's Pomona*, *Gascogne's Scarlet*, *Brabant Bellefleur*, *Mère de Ménage*, *Alexandra*, and *Queen Caroline* were splendid. Mr. John Scott was 3rd.

For twelve dishes of dessert Apples, Messrs. Bunyard & Co. led with very beautiful fruits, especially noticeable were *Swedish Reinette* and *King of the Pippins*; Mr. Geo. Woodward again was 2nd.

In the culinary class for same number of dishes the positions were reversed, Mr. Geo. Woodward being 1st and Messrs. Bunyard & Co. 2nd; Mr. H. Berwick was 3rd. The whole of the fruit was fine.

The next class was one for a table of hardy fruits, 12 feet by 6 feet, arranged for effect. Messrs. T. F. Rivers & Son, Sawbridgeworth, who were awarded a 1st prize, staged a remarkably attractive collection. The table was laden by every variety of fruit that could be had at this season from the garden, and of the best quality. The background was composed of

a group of Bijou Apple trees covered with the lovely fruits, looking almost as if they had been placed on, so regular did they appear.

Mr. Geo. Woodward secured 1st place for twenty-four dishes of Pears (distinct), and amongst a grand lot the following were the best:—General Todtleben, Pitmaston Duchess, Lonise Bonne of Jersey, Durandean, and Beurré Hardy; Mr. G. Goldsmith, gr. to Sir E. G. Loder, Bart., Leonardalee, Horsham, was 2d; and Mr. W. Iggulden, gr. to the Earl of Cork, Marston House, Frome, Somerset, was 3rd.

Mr. A. Offer, Handcross Park Gardens, Crawley, was 1st, for twelve dishes; his best were Souvenir du Congrès, Doyenné Boussoch, and Doyenné du Comice. Mr. R. Smith, Presdales Gardens, Ware, Wilts, was a good 2d.

Messrs. Geo. Bunyard & Co. secured 1st for twelve dishes of Apples and Pears, grown in an orchard-house, with a thorough good collection; Messrs. T. F. Rivers & Son, Sawbridgeworth, were 2d, also showing well; the Apples in this exhibit were wonderful, but the Pears were rather weak.

Mr. George Woodward was 1st for three dishes of dessert Apples, showing Cox's Orange Pippin, Washington, and Ribston Pippin, the last-named being quite a perfect dish; Mr. Jas. Hall, Croscombe, Wells, Somerset, was 2d; and the English Fruit and Rose Co., Hereford, 3rd, out of a great number of entries.

In the similar class for culinary Apples, the 1st place was taken by Mr. J. Nicholson, gr. to J. W. Melles, Esq., Sewardstone Lodge, Chingford, the best dish being Peasgood's Nonsuch; Mr. W. Cotterill, gr. to Captain Harcourt Rose, Oxon Heath, Tonbridge, was 2d. For three dishes of Peaches, Mr. Woodward was 1st, with fine Palmerston, Sea Eagle, and Nectarine; Messrs. T. F. Rivers & Son were 2d; and Mr. A. Offer 3rd. For one dish, Mr. W. Fairweather, gr. to J. A. Millen, Esq., Bifrons Park, Canterbury, was 1st, and Mr. Woodward 2d. Messrs. T. F. Rivers & Son were 1st for six dishes of Plums; and in the class for two dishes, Mr. C. J. Waite, gr. to Colonel W. P. Talbot, Glenhurst, Esher, was 1st; Mr. R. Smith followed.

Amateurs.—Mr. Geo. Woodward led in the class for twenty-four dishes of Apples, including eight dessert and sixteen culinary varieties, showing much the same quality as he had in the open classes. Mr. G. Goldsmith 2d, and Mr. Geo. Chambers, Beech Farm, Mereworth, Maidstone, 3rd.

For twelve dishes of Apples, four of dessert, and twelve culinary, the 1st place was to Mr. S. H. Goodwin, Smartswell, Kent. They were a beautiful lot, and well coloured, Peasgood's Nonsuch, Worcester Pearmain and Cox's Pomona especially so. Mr. J. Austin T. Killick, Weaving, Maidstone, was 2d; and Mr. Goldsmith 3rd. For six dishes of dessert Apples Mr. Geo. Chambers, Beech Farm, Maidstone, was 1st, and Mr. R. Potter, gr. to Sir M. Collet, Bart., St. Clere, Kemsing, Sevenoaks, 2d.

In a similar class for culinary, Mr. W. Minifie, Beatlands, Sidmouth, Devon, was 1st; and Mr. Geo. Chambers, 2d.

Mr. Goldsmith led for twelve dishes of Pears, Pitmaston Duchess, and Marie Louise d'Uccle being very fine in this stand; 2nd, Mr. W. Allan, gr. to Lord Suffield, Gunton Park, Norwich; 3rd, Mr. Geo. Woodward.

For six dishes, Mr. W. Wiles, gr. to Mrs. Phillips, Unsted Park, Godalming, was 1st; and Mr. Dean, gr. to G. L. Gower, Esq., Titsey Place, Lumpsfield, 2d.

For two dishes of Plums, Mr. Goldsmith was 1st; and Mr. Jas. Friend, gr. to Hon. P. C. Glynn, Rookanest Gardens, Godstone, 2nd.

Vegetables.—These were well shown. Mr. Thos. Wilkins, gr. to Lady Theodora Guest, Henbridge, near Blandford, who was 1st, staged a first-class collection in every respect; Mr. C. J. Waite, was 2d. The remaining three classes were for Tomatos, one for a collection of not more than twelve dishes, and a class each for one dish of red and yellow varieties. In all three the 1st prize was secured by Mr. E. Ryder, The Nurseries, Orpington. Mr. H. Deverill, Banbury, had a collection of Onions; Mr. Henry Merryweather, Southwell, a quantity of Bramley's Seedling Apple; Mr. Robert Grigor a number of fruits of Pitmaston Duchess Pear, the heaviest fruit weighing 25 oz. A collection of Tomatos were from Mr. J. Strong, gr. to P. R. Morse, Esq., Wickham, Witham, Essex; and a collection of vegetables from Mr. Walter Salmon, Ivy Cottages, Elder Road, West Norwood.

Miscellaneous.—The exhibits in this section were exceedingly numerous, and we can only mention

some of the larger and more interesting ones. Messrs. T. F. Rivers & Sons, had a collection of fruit, including Grapes; Messrs. Rothschild, Gunnersbury House, Acton (cr., Mr. Rynolds), showed twenty good fruits of Melons.

Some good Black Alicante Grapes came from Mr. T. M. Le Pelley, Rusper Valley Vineries, Rusper, Sussex. Mr. Chas. Turner, Slough, showed a splendid dish of Mère de Méoage Apples, the five fruits weighing 5 lb. 5½ oz., and the heaviest fruit 22½ oz. Mr. Chas. Terry, Tatton Park, Knutsford, sent a number of Pine-apples; and Mr. W. Mancey, gr. to A. D. Druce, Esq., Upper Gatton, R-dhill, ten fruits of Pitmaston Duchess Pear, weighing 17 lb. 6 oz.; heaviest fruit, 2 lb.

A large collection of fruit was shown by Messrs. John Laing & Son, Forest Hill, S.E., by S. Spooner & Sons, Honnslow; Mr. T. A. Hester, gr. to W. G. Dawson, Esq., The Links, Plumstead Common; Mr. John Watkins, Hereford; Messrs. W. Paul & Son, Waltham Cross, also Roase, &c. Messrs. J. Cheal & Sons, Crawley, with fine pyramids of Dahlias as a background for the fruit. Messrs. James Veitch & Son, Chelsea; Messrs. George Bunyard & Co., Maidstone; and Mr. H. Berwick, Sidmouth Nurseries, North Devon.

vase, which may be of any shape, as the flexible supports of the rack can be bent to any position. It can also be utilised, suspended by wire, for the display of dried flowers and grasses, the outside of the rack being covered with a little green moss. The manufacturers and patentees are Messrs. Corry & Co., Limited, of Finsbury Street, London, E.C.

SCOTLAND.

FRUIT NOTES, ETC., FROM NORWOOD, ALLOA.

AMONG the suburban residences north of the Forth, few can surpass the beautiful home of Mr. Paton, who is held in such high esteem in and for a long distance around Alloa. But it is a brief reference to some of the chief items of interest in the beautiful gardens of that justly-popular gentleman, we now submit. Often have we been asked of late "how our friend Kirk is looking?" which means the fruit and other highly-cultivated things in the gardens, under the charge of that well-known enthusiast, a winner of six hundred prizes.

We are now (after a pleasant visit on June 5) able to state that the fruits under glass were never in better condition than they were this season. The Grapes were as near perfection as we have ever seen Grapes anywhere. Though the vineries are not large structures, they are all returning their full quota, and if "Wee Kirk" (as his special friends address him), did not take the lead at the shows where he intended exhibiting this season, those who beat him with their exhibits deserve great credit.

Passing through houses, narrow, and somewhat confined, great crops of Melons were seen. Their roots are growing in narrow beds, which render the plants manageable and very fruitful; and food, (liquid and solid), can be supplied with a liberal hand. The roots being encased in the firm soil consume a deal of nutriment, which tells very favourably on the fruit. Hero of Lockinge, Windsock Castle, and Sutton's Monarch, among other sorts for general use and comparing notes, are valued most.

A good exterior commends a Melon, but that quality only never ensures a welcome by connoisseurs. Tomatos are cultivated in narrow root-space with much success; and now that their name is legion, one cannot with much safety single out a small number of sorts which are preferable to all others. We could discern no appreciative difference in Mr. Kirk's fine crops. As we wished to see the Grapes, we passed through the Pine-houses, onward in front of five hundred Chrysanthemums in great vigour, and pits full of Primulas, Carnations, Cinerarias, and other plants grown in quantity for winter decoration of conservatory, rooms, and flower-houses. No. 1 vinery, with Vines not quite established: there were bunches very perfect in form, from 3 lb. to 6 lb. weight, grandly coloured, and berries of great size, Black Hamburg, Madresfield Court—not a cracked berry to be seen; Muscat Hamburg, Buckland Sweetwater; Foster's Seedling were ripe, and certainly pictures of first-rate cultivation. It was noticeable that the strongest Vines (none were extra gross), did not bear the finest fruit. No. 2 was filled nearly to the apex; back and front was a picture of Grape-culture, which could not be quickly forgotten. Bunches, mostly of the same form and size on each Vine, nearly equal, were like those of No. 1, first rate. The varieties grown are Duke of Buccleuch, 3 to 4 lb. weight, Gros Colmar, Gros Maroc, Muscat of Alexandria, and Golden Queen. No. 3 vinery had Bowood Muscat, Bowood Alexandra, Cooper's Black and Madresfield Court, well advanced towards the ripening stage. Mr. Kirk believes in early maturation when the question of keeping is of moment. No. 4, and the latest house, contained capital Lady Downes, Alicante, Gros Maroc, equal to the other crops, with strong dark green foliage. It was noticed that two of the vineries had been turned into Peach-houses, in which were Hale's Early (ripening), Stirling Castle, and Barrington Peaches, receiving careful cultural attention. In other houses were large numbers of foliage plants, such as Dracenas and Crotonas in fine colour, and cool and warm Orchids filled two small houses. Masdevallia and Odontoglossum were remarkable for vigour. The conservatory was very gay with finely-grown Pelargoniums, Tuberos Begonias, Palms, and other popular decorative plants. Such plants as Azaleas for winter service were in fine condition, which Mr.

FIG. 65.—THE "MARTIN" FLOWER RACK.

FIG. 66.—THE "MARTIN" FLOWER-RACK IN VASE.

Messrs. Jas. Veitch & Sons, Chelsea, had a splendid collection of Nepenthes; also some blooms of Rhododendron hybrids, Streptocarpus hybrid, Cyripediums, and sprays of ornamental shrubs. Messrs. W. Innes & Co., Sunny Hill Vinery, Littleover, Derby, staged a collection of first-class Grapes which had been grown by the aid of their Fertiliser. There were some Dahlia blooms from Mr. A. Rawlings, Romford, and some Begonia blooms from Messrs. H. Cannell & Sons, Swanley, as well as a large collection of vegetables from the same firm.

NEW INVENTION

THE "MARTIN" FLOWER-RACK.

THE patented invention, of which we give illustrations, is likely to prove of value to exhibitors of cut flowers, as well as for table decorations, in regulating the position of flowers in vases, bowls, cups, &c., and exhibiting them to the best advantage. The rack can easily be filled before placing it in the

Kirk helps materially with favourite manures. Cherries on the walls were large and in quantity. Small fruits and Strawberries were abundant, but Apples had not turned out as expected. Begonias on the parterre were conspicuous for their large flowers; and other outside decoration was on a par with other departments.

PLANTS FROM KEIR AT EDINBURGH.

Conspicuous among the plants exhibited by Mr. Lunt, of Keir Gardens, Dunblane, at the Royal Caledonian Society's show, were specimens of unusually high cultural merit, and as some of the leading newspapers state, "carried all before them," *Croton Chelsonii*, 7 by 5 feet; *C. Holdsworthii*, do.; *Dracena Youngii*, 7 by 6 feet; *Alocasia metallica*, 6 feet across; *Dieffenbachia Bausei*, 4 feet 6 inches through; *Anthurium Veitchii* with leaves 4½ feet long; two immense *Dracenas* *Shepherdii* and *Baptistii*, we do not know their size, but health and colouring were of the highest order; of great size were *Palms* *Areca Bauerii*, *Kentia Belmoreana*, *K. Fosteriana*, *Rhapis flabelliformis*, and *Areca lutescens*, and a *Cycad* 9 feet through. Mr. Lunt, as reported in Edinburgh papers, received a medal for high culture. Now that this clever cultivator has made his *début* in Edinburgh with plants (he has been a successful exhibitor of fruits for some years), he will be looked for in the future, and welcomed by lovers of plants such as are really creditable at exhibitions like those promoted by the Royal Caledonian Society. *M. T.*

TECHNICAL EDUCATION IN HORTICULTURE.

ALTHOUGH it may be a new thing for County Councils to offer prizes for the nicest-kept and best-cropped gardens, as Mr. D. T. Fish suggested recently in these pages, it was part of a system practised in my own knowledge by some school-managers of over thirty years ago. When a boy a school, in a quiet Oxfordshire village, I had my small plot, and was not a little proud of the commendations received for my method of cultivating it; and it may be said that any encouragement offered in this way gives rise to a desire to acquire further knowledge on the part of the recipient. Horticultural societies in rural districts can do much towards increasing a taste for gardening amongst cottagers, by offering prizes for the best-kept garden; in fact, I know of no better way of improving the cultivation of their gardens than by offering money-prizes to those *bona fide* cottagers. Some persons may retort, but what is a *bona fide* cottager? Well, it is perhaps a difficult question to answer. I have filled for the last ten years the office of secretary to a society which is mainly intended for the improvement of cottage-gardens in this neighbourhood, and have therefore had much opportunity of observing the progress which has been made by some of the competitors. We have two classes of competitors whose status is defined by the amount of wages earned, and which does away with the jealousy that arises when some are handicapped by their neighbours who happen to be in receipt of higher wages, and have therefore an advantage in the matter of purchasing seeds and plants.

The two classes are defined thus—those whose regular weekly wages exceed 15s., and those who are not in receipt of that sum. The spirit of emulation is keen in the cottage gardener, and they will try hard not to be beaten by their neighbours, working laboriously to improve their gardens in their spare moments. According to my experience of teaching horticulture by means of lectures, something is required beyond speaking; the mere matter of preaching to them, as it were, is not sufficient to interest them. If County Councils were to instruct their teachers to give demonstrations on the platform in such subjects as the pruning of fruit trees, including root-pruning, preparatory to planting them, and the best means of staking the trees, much real good would be done. It is not merely a question of how many bushels of Potatoes ought to be produced from so much land; nor how much a cottager should get for his fruit crop—but how such crops are best obtained, and the best methods to pursue. A few practical demon-

strations of this kind would do much more towards enlightening the hearers than the chatter that some lecturers indulge in. Plenty of cottagers in rural districts can judge the amount of practical knowledge possessed by the lecturer more accurately than he supposes, and if they discover that his teaching is largely based on theory, the impression that he will make on them is not lasting. Lectures without demonstration are almost valueless in teaching cottagers how to manage their gardens, they know perfectly well that the lecturer would not know how to do the work he professes to teach them. *E. Molyneux.*

— It seems at this time of day almost superfluous to dispute either that there is a need for, or a benefit derived from, technical education. But as an example of the need of such teaching, I would quote from that excellent magazine, *Work*, where, on p. 247 of the June number, we find this note:—"According to the report of the London County Council, by Mr. Llewellyn Smit, apprenticeships have practically died out in all trades excepting a few, such as shipwrights and barge-builders, so far as London is concerned." He adds that workmen he has come into contact with have been practically unanimous in thinking that the old system cannot be revived, and that technical education, imparted through classes, must in future take its place.

But apart from the consideration of such questions as those involved in the above statement, any thinking person must be struck with the fact that so-called education does not produce, or tend to produce, that all-round development of the bodily and mental capacities as intelligent persons desire. There is no doubt, owing greatly to the dull and rigid routine of our elementary schools, where memory takes the place of thinking, and the standard of attainments required, seems to indicate that boys and girls are supposed to turn out a mongrel—something between a clerk and a philosopher. The training of the children in the elementary schools seems chiefly to fail in not teaching them the common facts of every-day life. But as soon as we begin in the technical school to teach them how to do something, daylight and hope begin to dawn on us.

Of what use is it to teach children how to add up thousands of pounds? But when we see a child able to darn its stocking, or sharpen a knife, there seems to be a clear gain to the child and humanity itself.

Now the experience of practical men in this immediate neighbourhood is most encouraging in respect of the acceptance and result of technical education. The first season it was put into working order, the attendance was very small, hardly making an average of ten. But this last season has seen an average attendance of thirty, taking several villages together; and about 400 at Wolverton. At the lectures attended by these people, instruction was given by practical and proficient men in bee-keeping, fruit-growing, and vegetable culture, and diagrams, implements, apparatus, and specimens of growths for pruning were handed before the spectators, and at intervals, under the control of the chairman, the audience were encouraged to enter into discussion on points raised by the lecturers.

One important subject handled was the method of the prevention and cure of insect pests and diseases of fruit trees and general crops, and, considering the ravages of the Gooseberry-sawfly for the two last seasons, it is a matter of congratulation that the lectures made the matter so clear, and gave it so prominent a place. Since the spread of this information, people take a hint much more readily regarding the method of dealing with these diseases and pests, and several cottagers have saved their crops by following instruction based upon information given at these lectures.

So much good has already resulted from the practical and sociable way in which the instruction was imparted—for in some cases a little music and recitation helped to draw and keep the people together—that it is to be hoped next winter will see a further development of this form of teaching a knowledge of matters of every-day use, and if the allot-

ment-holders of the neighbourhood can be influenced to the same extent as the men at Wolverton, who work small patches of land there, a decided advance will be soon manifest in the methods of work, and better crops, the outcome of intelligently-directed effort.

It remains to be seen that fuller demonstrations, are afforded of methods of pruning, and courses of tillage, the management of bees, &c., during the summer months, and thus we may hope that the intelligence of our rural population will steadily increase. *J. Milsom.*

Obituary.

DEATH OF MR. G. BOGUE.—Many will hear with regret of the death of Mr. George Bogue, of 10, Hill Street, St. Albans, which took place, at the age of 86 years, on Tuesday, September 19. Mr. Bogue was a native of Lanarkshire, and came to St. Albans as head gardener to Lord Verulam, at Gorbambury, about forty-six years ago, and remained in his lordship's service for twenty-eight years. In his time Mr. Bogue was a gardener of some repute, and used frequently to contribute articles to the *Journal of Horticulture*; while for many years he supplied annually to this paper a rainfall table. The deceased, during his connection with Gorbambury, was a member of the committee of the Royal Horticultural Society, and seldom failed to attend their monthly meetings in London; and in the latter years of his life the deceased often referred with pride to this, and would speak in glowing terms of the times when he had sat at a committee meeting with the late Prince Consort. During the last eighteen years Mr. Bogue had lived a life of retirement. The funeral took place at St. Michael's Church, St. Albans, on Saturday, September 23.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.;
10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending September 23, is furnished from the Meteorological Office:—

"The weather during this period became cold and unsettled, especially in the northern and north-western parts of the kingdom, where heavy rain was experienced, with sleet or snow towards the end of the week. In most other localities the rainfall was comparatively slight, but in the 'Channel Islands,' where an appreciable quantity was measured daily, the aggregate fall was large. Thunder and lightning occurred over 'England, S.' during the middle or latter part of the week.

"The temperature was below the mean, the deficit ranging from 2° in most parts of England, to 3° or 4° in Scotland, and to 5° in 'Ireland, S.' The highest of the maxima, which occurred during the early days of the week, ranged from 70° in 'England, E.' to 61° in 'Scotland, W.,' and 60° in 'Scotland, N.' Later in the week the daily maxima were very low, the thermometer at some stations not reaching 50°. The lowest of the minima were recorded between the 21st and 23rd, and ranged from 29° to 31° in Scotland, from 28° to 34° in Ireland, and from 30° to 37° in England. In the 'Channel Islands' the lowest reading was 45°.

"The rainfall was greatly in excess of the mean in 'Scotland, N.' and the 'Channel Islands,' and considerably in excess in 'Scotland, E.,' 'England, N.W.,' and 'Ireland, N.;" in all other districts, however, there was again a deficit.

"The bright sunshine was much less prevalent than during the preceding week, but still exceeded the normal in 'Ireland,' 'Scotland, W.,' the 'Midland Counties,' and 'England, N.E.' The percentage of the possible amount of duration ranged from 41 in 'Ireland, S.,' and 40 in 'England, N.E.,' to 27 in 'England, S.,' 22 in 'Scotland, E.,' and to 18 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, September 28.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

PRICES rule as last week.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Leeks... 0 4-...	

POTATOS.

In consequence of the low prices, farmers are not loading quite so heavily, which makes prices a little firmer. Best Hebrons and Snowdrops, 100s. to 110s.; Bruce, 70s. to 80s.; other kinds, 42s. 6d. to 60s. J. B. Thomas.

SEEDS.

LONDON: Sept. 27.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market thinly attended, with but little business doing. Choice Trifolium is now obtainable at very tempting rates. Winter Tares are again dearer; it appears likely that the supply will not hold out to go round. Seed-rye is firm. There is more inquiry for Peas and Haricots. The Canary seed market daily gathers strength; doubts are expressed as to whether all the contract new seed bought can be delivered. Linseed tends upwards.

FRUITS AND VEGETABLES.

BOROUGH: September 26.—Quotations:—Cabbages, 6s. to 8s.; Cauliflowers, 5s. to 8s. per tally; Carrots, 2s. to 3s. per dozen bunches; Turnips, 1s. to 3s. 6d. per dozen bunches; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 4s. to 5s. per bag; Damsons, 1s. 6d. to 2s. per half-sieve; Plums, 1s. 6d. to 2s. per half-sieve; Apples, 2s. 6d. to 3s. per bushel.

SPITALFIELDS: September 26.—Quotations:—Cabbages, 6s. to 8s. per tally; Cauliflowers, 5s. to 8s. per tally; Turnips, 1s. to 2s. 6d. per dozen bunches; Carrots, 2s. to 3s. per dozen bunches; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 4s. to 5s. per bag; Apples, to 2s. 6d. to 3s. per bushel; Damsons, 1s. 6d. to 2s. per half-sieve; Plums, 1s. 6d. to 3s. per half-sieve.

STRATFORD: Sept. 26.—There has been a good supply of all kinds of produce at the above market during the past week, and a brisk trade has been done at the undermentioned quotations:—Cabbages, 4s. to 7s. per tally; Savoy, 4s. to 7s. per tally; Cauliflowers, 1s. 6d. to 1s. 9d. per dozen; do., 5s. to 7s. 6d. per tally; Turnips, 2s. to 2s. 6d. per dozen bunches; do., 50s. to 55s. per ton; Carrots, household, 50s. to 70s. per ton; cattle-feeding, 30s. to 35s. per ton; Mangels, 20s. to 25s. per ton; Swedes, 22s. 6d. to 27s. 6d. per ton; Onions, Dutch, 5s. to 5s. 6d. per bag; Apples, English, 1s. 9d. to 4s. per bushel; Onions, 6s. to 6s. 6d. per case; Plums, 2s. 6s. to 3s. per half-sieve; Pears, 3s. to 4s. per sieve.

FARRINGTON: September 27.—Quotations:—Cabbages, 6s. to 8s.; Cauliflowers, 5s. to 8s. per tally; Turnips, 1s. to 2s. 6d.; Carrots, 2s. to 3s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 4s. to 5s. 6d. per bag; Horseradish, 1s. 6d. per bundle; Marrows, 1s. 6d. per dozen.

FARRINGTON: September 28.—Quotations:—Apples, 2s. to 3s. per bush.; Pears, 3s. to 5s. do. (Capiaumont); Calabasse, 3s. per half-bushel; Plums, 3s. per half-sieve; Damsons, 4s. do.; Tomatos, 4s. per dozen pounds; Melons, 4s. per case.

POTATOS.

BOROUGH AND SPITALFIELDS: September 26.—Quotations ranged from 40s. to 105s. per ton.

STRATFORD: September 26.—Quotations:—Light-lands, 45s. to 60s.; dark do., 45s. to 60s.; Sutton's Abundance, 60s. to 70s.; Hebrons, 70s. to 80s. per ton.

FARRINGTON: September 28.—Quotations:—Sutton's Abundance, 80s.; Snowdrops, 70s. to 80s.; Reading Grants, 50s. to 60s.; Bruce's, 50s. to 60s.; Imperators, 60s. to 65s. per ton.

LONDON AVERAGES: September 27.—Hebrons, 70s. to 90s.; Regents, 60s. to 80s.; Snowdrops, 60s. to 100s.; Champions, 40s. to 60s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending September 23, and for the corresponding period last year:—1893: Wheat, 28s. 9d.; Barley, 27s. 10d.; Oats, 17s. 9d. 1892: Wheat, 28s. 4d.; Barley, 28s. 3d.; Oats, 18s. 10d.

BOOKS: Decorator, Table Decorations, by Annie Hassard; at the second-hand bookshops.

CARNATION FUNGUS: C. & C. Puccinia Dianthi; you might try cautiously the application of the Bordeaux Mixture.

HANDICART FOR GARDEN PLANTS: E. L. Some of the horticultural sundries may make them. See our advertisement columns.

HYBRID ANTHURIUM: O. O. W. We are greatly obliged for the specimens. We have seen so many seedlings of a similar character raised from inter-crossing varieties of A. Scherzerianum, that we are still rather sceptical as to the influence of the Richardia. A comparative microscopical examination of the two parents and the supposed hybrid would settle the point, but we have no time to undertake the work.

INSECT ON YOUNG LARCH TREES: Oakleaf. We can find nothing but aphides on the Larch twigs sent, and these are quite incapable of the damage to the bark. In all probability, it is the work of the destructive weevil, Hyllobius abietis. R. McL.

INSECT ON CHRYSANTHEMUMS: R. O. The insect on Chrysanthemums in the daytime are a very common species of bug (Anthocoris nemorum), found on many kinds of plants, and not generally supposed to attack the plants themselves, but to be on the search for aphides, and other insect enemies. R. McL.

MELON: H. B. Next week, after close examination.

MICROSCOPE: Micro. No; it is not difficult to get good results with a quarter-inch, but it requires a little practice. Get some friend to put you in the way of using it.

NAMES OF FRUITS (six only should be sent at any one time): Gardeners' Orphan Fund. We have received from E. B., Belgium, and H. N. O., Hampshire, postal orders for 10s., as a recognition of our services in naming fruit. The sums have been handed to the chairman of the committee.—W. F. H. 1, Colmar d'Éte; 2, Beurré Diel; 3, Doyenné Boussoch; 4, Duchesse d'Angoulême; 5, Triomphe de Jodoigne; 6, Ne Plus Meuris; 7, Beurré Hardy; 8, Pitmaston Duchess; 9, Beurré Boac; 10, Beurré Superfin; 11, St. Germain (Uvedale's); 12, Beurré Bachelier.—E. W. C. 1, Wellington; 2, Chaumontel; 3, Beurré Diel; 4, Louise Bonne de Jersey; 5, Wellington; 6, had specimen; 7, Marie Louise; 8, not recognised.—S. Duffield, 1, Colonel Vaughan; 2, Beurré Clairgeau; 3, Small's Admirable; 4, Alexander; 5, Round Winter Nonsuch; 6, Beurré Diel.—W. H. D. 1, Triomphe de Jodoigne; 2, Easter Beurré; 3, Old Bergamotte; 4, Wellington; 5, King of the Pippins; 6, not recognised.—Alfred Mohr, 1, King of the Pippins; 2, Blenheim Orange; 3, Ribston Pippin; 4, New Hawthornden; 5, Old Nonsuch; 6, Wellington.—W. Ripley, 1, not recognised; 2, Jersey Gratioli; 3, Soldat Laboureur.—W. George, 1, Zephirin Gregoire; 2, King of the Pippins; 3, crushed; 4, Beurré Clairgeau.—W. D. Good variety, not recognised.—W. S. R.* Your *Abutilon* is the best yellow variety we have seen.

PEACHES: *E. G. A.* Our memoranda do not state if they were grown inside or out. To find out all the facts would take too much of our time.

ROOT COMPETITION: *F. P. D.* As the Cabbage cannot be called a "root," the collection which contained Cabbages should have been disqualified.

"SILVER GLOBULAR THUYA": *H. E.* Is probably a Juniper. There is no Juniper that answers to the description. Citrus; yes, please.

TARRING A STAGE IN A FORCING-HOUSE: *W. C.* We should certainly hesitate to tar such a large mass of woodwork, and afterwards put plants into the house, as the fumes of the tar in a house that must be closed for forcing purposes would have a bad effect on the leaves. Better use some dark-coloured, cheap paint, as for instance, Carson's anti-corrosion. It is durable; and if not of particular smoothness, it still looks well.

YARROW ON LAWN TURF: *W. C.* If spudding-out the plants is too troublesome a job, it would be advisable to dig the whole lawn over, first taking up the turf which is free from the weed, laying it aside in rolls of 3 feet by 1 foot, or squares of 1 foot for future use in making-up the margins of walks and beds. In digging the lawn, throw out all roots and top-growth of weeds (perennial), and work-in a considerable dressing of loam, itself free from weeds, and if the land be of a hungry nature, some manure may be worked-in. This season grass seeds may be sown at once, with the certainty of getting a green surface before winter.

DIED.—We regret to announce the death, on the 25th inst., after a long illness, of Mrs. LATHAM. She had somewhat recovered, but a relapse occurred, and she died rather suddenly on the morning of the 24th inst. Great sympathy is felt for Mr. W. B. LATHAM, the well-known curator of the Edgbaston Botanical Gardens, Birmingham, by a very large circle of friends.

— We regret to have to record the death of Lord ALFRED CHURCHILL, at one time a member of the Council of the Royal Horticultural Society.

— As this sheet is passing through the press we receive the announcement of the death of Mr. F. L. AMES, well-known in this country as a patron of Horticulture and a connoisseur in Orchids.

THE IMPROVED GARDEN GULLY
(VINCE'S PATENT).
This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—
8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d.
(The larger sizes are very strong for carriage drives.)
Full Particulars and Testimonials on application.

VINCE & VINE,
58, Chester Road, Upper Holloway, London, N.

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered

HOT-WATER BOILERS,

Others with TUBES, SHELVES, & HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.

Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schroder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,

H. BALLANTINE, Head Gardener to Baron Schroder. We have a similar Mill and set of Pumps in hand for Lord Northbourne.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,
Will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glass-houses, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kinds of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

TO FLORISTS and FRUITERS.—A Young Lady desires re-engagement. Thoroughly competent to undertake all branches of the above. Highest references. Disengaged.—C. S., Claremont, Grove Road, Leytonstone.

IT IS A GREAT MISFORTUNE that the Cholera Plague should threaten us at the present time, as, owing to the many weeks of tropical heat we have experienced, people who otherwise would have perhaps been in a position to think lightly of the attacks of even the most dangerous diseases, have become so weakened that a slight attack of diarrhoea might have fatal results. The report therefore that Cholera germs are flying about cannot fail to be disquieting to all classes. If people use Holloway's Pills and Ointment they need have no dread of being attacked by the dreaded complaint. They are a preventive as well as a cure, and through their medium thousands of valuable lives have been saved.

Friday Next, October 13.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on FRIDAY NEXT, October 13, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., by order of Mr. F. Sander, Importations of the following new and valuable ORCHIDS, without the least reserve. A new importation of DENDROBES just to hand in splendid condition from the Wellesley Islands, Gulf of Carpentaria. The Butterfly plant of the natives.

These Dendrobies resemble *Statterianum*, *Phalaenopsis*, *superbiens*, and also bigbium, probably it may be a local form of—or near bigbium—what few flowers our man saw were large and of a dark crimson and violet colour, they are exceedingly floriferous, and are smothered with old flower-spikes. We believe this is the first lot of Orchids ever collected in this region, the growths are thoroughly matured and the plants could not be in finer condition.

LYCASTE or ANGULOEA SPECIES

(Unflowered.)

Imported by us with CATTLEYA REX. The flowers are said to be large, and white and yellow. The plants offered have not yet been flowered in Europe.

CYPRIPEDIUM ROTHSCCHILDIANUM,

in splendid condition. This is truly a superb *Cypripedium*, its flowers are of great size, and very lasting quality, the colours brilliant and striking. Altogether it is one of the finest *Cypripedes* in cultivation.

CYPRIPEDIUM SANDERIANUM.

The longest petalled of all *Cypripedes*. The most extraordinary and quaint known to cultivation.

CYPRIPEDIUM SPECIES,

In Bamboos, as imported from Java.

Foliage resembles *Masterianum* and some varieties of *barbatum*. Every plant offered is unflowered.

STANHOPEA, white, in the way of *Masterii* and *Amesiana*.

ONCIDIUM PRETEXTUM, O. JONESTIANUM,

O. ROGERSSII, O. PHYMATOCHILUM.

ONCIDIUM LANCEANUM SUPERBUM,

The richly-coloured free-flowering form.

SACCOLABIUM SPECIES.

Sent home by our Collector from Darjeeling. This is a splendid species, in the way of the superb *Saccolabium speciosissimum*.

CYPRIPEDIUM SPECIES,

From Tongarong, Dutch Borneo.

Just received in good order and condition. Leaves resemble somewhat *C. Sanderianum*. Our Collector received these plants from a Dutch Trader, who states that it produces long stems of bronzy-red and yellow blossoms.

DENDROBIUM LOWII, CEOLOGYNE PANDURATA,

EPIDENDRUM GODEFFIANUM, CATASSTUMS, &c.

Also established plants of the rare

ODONTOGLOSSUM LONDESBOROUGHIANUM and

O. MADRESE, &c.

On view morning of Sale, and Catalogues had.

Tuesday and Wednesday, October 17 and 18.

THE LANGFORD PARK COLLECTION OF ORCHIDS.

Collected regardless of expense, in superb condition, and comprising exceedingly well grown ODONTOGLOSSUM ALEXANDRE, best type, mostly unflowered and many marked varieties; CATTLEYAS, MASDEVALLIAS, DISA GRANDIFLORA, LELIA ANCEPS ALBA, with spikes; SOBRALIA VIRGINALIS, DENDROBES in variety; CYPRIPEDIUMS, VANDAS, and many choice species of ANGRECUMS, in spikes, too numerous to mention.

MESSRS. PROTHEROE AND MORRIS have received instruction to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY and WEDNESDAY, October 17 and 18, at half-past 12 o'clock each day.

NEW AND MAGNIFICENT CYPRIPEDIUM CHARLESWORTHII

(ROLFE, N. SP.)

Exhibited and unanimously awarded a First-class Certificate by the Orchid Committee of the Royal Horticultural Society, and pronounced by every one to be the most beautiful and charming Cypripedium introduced, causing quite a sensation at the Drill Hall, on Tuesday, September 26, 1893.

The special feature of this novelty is the dorsal sepal, which is quite distinct in appearance and colour to any other known Cypripedium, which will render it exceptionally valuable to the hybridist.

The *Gardeners' Chronicle* says:—"There was no more than usually interesting show of Orchids, but by far the most novel and beautiful exhibit was a plant of Cypripedium Charlesworthii, Rolfe, n. sp., First-class Certificate, an entirely new species, imported by Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, and exhibited by them for the first time, the exhibit coming in for a great amount of attention and admiration. The plant in growth somewhat resembles C. Spicerianum, and the flowers, which are borne on scapes about 3 inches in height, are unlike any other known species. The beautiful flat, upper sepal is 2½ inches wide, broadly orbicular, white, tinged, and veined over its surface with light rosy-purple; the apex alone showing a white marbling. The lower sepals are about 1 inch broad, greenish-white. The petals, which resemble those of C. insigne, are plain-edged, over 1½ inch long, yellowish, tinged with brown; the lip also somewhat resembles that of the Sylhet form of C. insigne, and is similar in colour to the petals. The saminode is very singular, resembling pure white porcelain, the protuberance in the centre being conical in form, and not a single spur, as in C. insigne. It is an extraordinary and beautiful species."

The *Garden* says:—"A First-class Certificate awarded to Cypripedium Charlesworthii, Rolfe, a distinct and decidedly novel species, which cannot

be compared with any that we can call to mind. The plant is of dwarf habit, the flowers each having a remarkably fine dorsal sepal, extra large, measuring about 2½ inches each way; the colour a pale pink, suffused with purple, and having a lighter network towards the extremities; the petals are shaded with greenish-brown, so also is the pouch, which is rather small. A greater novelty amongst the species of the Slipper family has not been seen for a long time. From Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford."

The *Journal of Horticulture* says:—"A very remarkable introduction from the East Indies; it is a distinct and beautiful species, very dwarf, with long narrow leaves. The flower stem is only 3 to 4 inches long; the lip is short, green, heavily suffused with bronzy-brown, and the dorsal sepal is very noteworthy—it is broad and rounded, and the colouring is a beautiful soft rose, delicately veined; the staminode is pure white. A feature of the leafage are the rows of dots on the reverse side. The species is a great acquisition (First-class Certificate)."

The *Gardening World* says:—"An interesting collection of Orchids was exhibited by Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, including a handsome new species, named Cypripedium Charlesworthii, from the East Indies."

In offering this great novelty, we beg to state that we are the sole importers of this plant. We shall be very pleased to quote size, price, and full particulars. Inspection cordially invited.

ROSES IN POTS
HIGHEST AWARDS in 1892 and 1893, viz:—
Silver Cup (the only one given for Roses), at the
Temple Show of the R.H.S.; Three Gold Medals
at the International Horticultural and Garden-
ing and Forestry Exhibitions; Large Silver and
Silver-gilt Medals from the Royal Botanic and
Royal Horticultural Societies.

WM. PAUL & SON
Respectfully invite Orders for the above, their Stock being
largely in excess of all previous seasons, and if possible even
finer in quality:—
Extra-sized plants of TEA and NOISETTE
varieties, in 8-inch pots (including climbing kinds for
Conservatories, &c., with 8 to 10 feet shoots), 42s. to 60s.
per dozen.
Extra-sized HYBRID PERPETUALS, in 8-inch
pots, 21s. to 42s. per dozen.
Smaller Plants, in 5-inch and 6-inch pots, 9s. to
30s. per dozen.
Half Specimens and Specimens, invaluable for
Greenhouse and Conservatory Decoration, also for Exhibi-
tion purposes, the finest collection in existence, 5s. to
63s. each.

Immense Stocks of Standard, Half Standard,
Dwarf, and Climbing ROSES in the Open
Ground, ready for removal from the middle of
October onwards.

Also large Collections of Fruit Trees, Hardy
Trees and Shrubs, Camellias, Bulbs, &c.
Priced Descriptive Catalogues free by Post.

THE
Gardeners' Chronicle.
SATURDAY, OCTOBER 7, 1893.

ON THE CULTIVATION OF SOME
OF THE RARER FRUITS AND VEGE-
TABLES.

THE attention of practical gardeners has
been recently called to the fact, that
the number of different vegetables in general
use in this country is unnecessarily limited,
and that many descriptions of acknowledged merit,
which are commonly met with abroad, are seldom
or never seen at home although there is no reason
to suppose there would be any difficulty attendant
upon their cultivation.

For the past two or three years I have been
trying experiments in the culture of some of the
less well-known fruits and vegetables; and from
a popular, but not scientific point of view, the
results of my experience may interest some of
your readers, and I therefore give such of them
as I think worthy of notice.

FRUITS.

1. *Japanese Wineberry* (*Rubus phœnicolasius*).
—Two years ago, I obtained from Mr. J. L.
Childs, of Queen's co. New York, a number
of plants in good condition and growing well;
and these were planted in the garden in a
light, loamy soil well-manured, but no special
attention was given to them. The first year
they did little except increase in size; but
this summer, they gave an abundant crop.
It is claimed that this plant is absolutely free
from insect ravages; and I must say that, so far,
the claim seems to be justified. In all the many
dishes of fruit gathered, I have never once been
able to find any grub or other insect inside the
berry, such as are so frequently found in Rasp-
berries. The reason is probably that given,
namely, that the silky hair which clothes the
stems prevents insects from crawling up. The
berries are about as large as Raspberries, of a
shining scarlet or yellowish-red, entirely enclosed
in the hairy calyx until nearly mature, and
borne in large clusters. The flavour is exceed-
ingly agreeable, and distinct from that of any
other fruit known to me, and whether eaten raw
or cooked, or made into jam, they are excellent.
The price paid was 4 dols., or 10s. for twenty-
seven plants, carriage free. I consider this fruit
a real acquisition.

2. *Dwarf Juneberry* (*Amelanchier canadensis*).
—This forms a compact bush, bearing purple
berries the size of a Sloe, very juicy, and of an
agreeable flavour. My plants bore no fruit last
year, and but a small crop this summer. They are
growing vigorously, and seem to be perfectly
hardy, as would be expected, coming as they do
from Alaska. So far as I can judge, I believe
this fruit well worth growing.

3. *Cape Gooseberry, Barbados Gooseberry, or Ground Cherry (Physalis pubescens)*.—This fruit is, I believe, occasionally grown, but not so frequently as it deserves to be. The plants are raised in heat, and then planted out or grown in pots in a cool house. They do not succeed quite so well out-of-doors. They bear profusely, and require but little attention or trouble, but are apt to be infested with red-spider. The fruit, whether stewed or made into jam, is extremely good, and well worth cultivation.

VEGETABLES.

1. *Turnip-rooted Chervil*.—The seed of this should be sown in the previous autumn; it appears to be rather an uncertain grower. Last summer I got a good crop, but this year a very small one. The root is of the shape of a Carrot, about 3 or 4 inches long, and dark-coloured outside. When eaten immature, it looks and tastes when cooked precisely like suet, and is, therefore, by no means desirable. When ripe, the roots should be dug up and stored in sand. After keeping them a few weeks, they acquire a flavour closely resembling that of a sweet Chestnut, and are exceedingly good; but if kept very long, they become too sweet. This is an excellent vegetable if eaten at the right time.

2. *Finochio, or Florence Fennel (Foeniculum dulce)*.—I cannot succeed with this. In Italy, the broad-leaf stalks overlap each other at the base of the stem, forming a white enlargement the size of a hen's egg (see *Gard. Chron.*, p. 109, January 23, 1893, fig. 19), and these, when properly cooked, are extremely good; but here the leaf bases either do not enlarge to any extent, or do so too slowly, and are in consequence, hard and woody, and not fit to eat. Even during the recent almost tropical summer, I only got one or two plants fit to eat, out of a fairly large bed. They were sown in April on a sheltered south border; some raised and grown in a cool-house utterly failed. I fear Finochio cannot be grown successfully in this part of England.

3. *Asparagus Bean (Dolichos sesquipedalis)*.—I do not think our climate warm enough to mature this plant. I have grown it two years in succession on a warm south border. Last year I did not get a single Bean, and this summer, in spite of the unusual heat, I only got one dish from a fair-sized bed. The flavour is distinct and excellent, and if it were possible to grow it successfully, I am sure it would prove a great acquisition. The pods I gathered were about 12 inches long, but they are said to attain nearly double that length. I may add that they succeeded not much better in a cool house.

4. *Lima Bean*.—Of these, I have tried "Henderson's Dwarf" variety, which forms a small bush 15 inches high. It is very prolific, and perfectly hardy. The pods are dark shining green, very broad in proportion to their length, and very flat, almost the shape of a young pea-pod. I find that when cooked in the pod, even if quite young, they are not good, being tough and bitter; but the beans themselves when fairly large, are excellent, and of a distinct flavour; and coming in August and September, form a capital succession to the earlier Broad Beans. This is a vegetable well worth growing.

5. *Chinese Yam*.—These, raised in a cool house, and afterwards planted out, are easily grown, and produce good tubers in this climate. They are troublesome to dig up, as they grow very deep. To my fancy they resemble an indifferent Potato, being rather tasteless and without character. I hardly think they are worth growing where fairly good Potatoes may be had.

6. *Rush-nut or Chufa (Cyperus esculentus)*.—This plant succeeds fairly well with us. The "nuts" are really small tubers, the size of Cobnuts, which are produced by underground shoots. They should be dug up in October, and stored in a dry place. When parched, they are decidedly pleasant, somewhat resembling the Pea-nut. The plants should be raised in heat, and planted out in May or June. Quite worth trying.

7. *Sweet Potato*.—These I have only tried this year, and with small success. The tubers, procured from America, were grown in heat until they produced shoots, which were taken off and planted out on a warm south border. The young tubers now formed are few, and not half the size they should have attained. I intend trying them again, but I imagine that the past very hot summer has given them an unusually good chance, and I am not sanguine of success, although this variety succeeds in Canada. They might do well if grown in a frame, although cultivation to any extent would be impossible in this manner.

8. *Purple Egg Plant*.—This is a valuable vegetable for those who can grow it in a stove, and I believe it is occasionally cultivated in this country. It bears freely, and grows vigorously, although very subject to red-spider. The variety I have found the best is the Round Purple Egg Plant, described by Vilmorin, known in France as the Aubergine Violette Ronde. This variety is well worth growing. The fruit, when cooked, has a very distinct flavour, and is very generally appreciated.

9. *Capsicum*.—There is a very common but erroneous belief extant that Capsicums are invariably very hot and pungent, and are only of use for pickles. The fact is, that several of the varieties are quite mild in flavour, and make an excellent dish when cooked, and are also useful in salads. One of the best varieties to cultivate is the Spanish Mammoth, which is very large and prolific, easy to grow, and quite free from pungency, but, of course, requires a stove for its culture. Two other varieties are worth noticing as decorative plants. These are the Celestial Pepper and the Kaleidoscope Pepper, so named by Mr. J. L. CHILDS, of New York, from whom they may be procured. In the former the seed-pods are conical, about 2 inches high, growing erect on the branches, and of a creamy-white colour, turning to a brilliant scarlet when mature. The Kaleidoscope Pepper has spherical, pendent pods of a bright scarlet. Both of these plants, as well as the Mammoth variety before mentioned, are exceedingly ornamental when in fruit; and as they last a long time, they are most useful for decorative purposes. They are, all of them, profuse bearers; but the two varieties last described are intensely hot and pungent. They must all be grown in heat.

10. *Soy Bean (Soja hispida)*.—This, which is, I believe, considered a good vegetable, I have not hitherto succeeded with. Those I grew last year flowered too late to produce any pods, as the summer was cold and wet; and this year I accidentally omitted to sow them, and I am, therefore, unable to judge of their value. I should like to know whether any one has succeeded with them in this country.

Two varieties of Bean which I obtained from America may be noticed—one, called the Golden-eyed Wax, is a dwarf plant; and the other, the Ivory-pod Wax, is a climber. The pods of both are yellow, and rather smaller than our Butter Bean, which they are somewhat like in appearance. When cooked, they are remarkably tender and delicate, distinct in flavour from any others I am acquainted with; but it is quite likely that

they closely resemble some of the varieties of edible podded Kidney Beans described by VILMORIN.

11. *Celeriac*.—The well-known Celeriac does not appear to be grown nearly as universally as it deserves to be. It is, of course, unnecessary to describe it or its culture; but as it is much liked by nearly everybody, and can be grown without difficulty, it ought to be found wherever there is a garden, and a pit to raise it in. Coming into use, as it does in late autumn and winter, when the choice of vegetables is greatly limited, it is invaluable.

12. *Good King Henry*.—This is much praised by some gardeners. I have tried it, and can see no value in it whatever, either in the Asparagus or the Spinach stage of growth. I should be very glad to hear the experience of others in regard to it.

The foregoing notes and remarks are only intended for those who, like myself, are interested in experiments in the cultivation of such fruits and vegetables as are worth growing, but are seldom or never found in England. I am, of course, well aware that little or nothing that I have said can be new to, or add to the knowledge of, experienced and scientific horticulturists. *S. Courtauld, Bocking Place.*

NEW OR NOTEWORTHY PLANTS.

KNIPHOFIA PAUCIFLORA × MACOWANI.

This pretty new dwarf hybrid Kniphofia was raised by Mr. Dewar, now Curator of the Botanic Garden at Glasgow, shortly before he left Kew, by fertilising the pistil of *K. pauciflora* with the pollen of *K. Macowani*. The seeds were sown at Kew in October, 1892, and it has now just flowered for the first time. The two species are not very closely allied, and as it comes about half-way between them, it is very distinct, and well worthy of notice from a horticultural point of view. *K. pauciflora*, which is a recent introduction, is figured in *Bot. Mag.*, t. 7269. *K. Macowani*, which is figured in *Bot. Mag.*, t. 6167, is well known. The hybrid recedes from *pauciflora* by its dense raceme, longer sub-cylindrical flowers of a brighter yellow, tinged with red in a young state, and non-exserted stamens.

Leaves linear, $1\frac{1}{2}$ foot long, $\frac{3}{8}$ inch broad at the base, tapering gradually to the point; moderately firm, green, triquetrous, acutely keeled on the back, and acutely channelled down the face. Scape slender, green, terete, above a foot long. Raceme dense, oblong, 3 inches long; pedicels very short, all cernuous; bracts ovate, scarious, twice as long as the pedicels; expanded flowers, bright lemon-yellow; buds bright red. Perianth sub-cylindrical, an inch long, not at all constricted above the ovary; lobes ovate, obtuse. Stamens as long as the perianth. Style finally exserted. *J. G. Baker.*

ORCHID NOTES AND GLEANINGS.

CORYANTHES WOLFII, Lehmann.

In the *Orchid Review* for September, p. 264, a record is made of the first flowering in Europe of this species, under the care of Mr. F. W. Moore, the zealous Curator of the Royal Botanic Garden, Glasnevin. Attention was first called to this species in our columns by Consul Lehmann, 1891, ii., p. 483. The species is remarkable for its "flat, or slightly concave, perfectly solid hood, in which respects it comes near to *C. elegantium*, Lind. and Rchb. f., which also has an erect scape. In every other species the hood is helmet-shaped, and hollow underneath, as is *C. Lehmannii*'s second species, *C. Mastersiana*, so that *C. elegantium* would appear to be a nearer ally of *C. Wolfii*. The colour is as stated by Lehmann. The horns at the base of the column are proportionately large, being 5 lines long, while the hood

FIG. 67.—(A), CANNA L. E. BAILEY: YELLOW, WITH CRIMSON SPOTS. (GROUP 3.)
 (B), " MADAME CROZY: SCARLET, WITH YELLOW MARGINS.
 (GROUP 5.) (SEE P. 432.)

is only 9 lines broad. The flower is rather smaller than any previously known. It should be treated like a Stanhopea."

CATTELEYA CITRINA.

This is a beautiful dwarf plant, having glaucous persistent leaves, and large, fleshy, fragrant flowers, which last a long time in full perfection. In its native country we are told that it is found growing upon the undersides of the branches of trees, and hence the best plan is to fasten it upon a block of wood (Willow-wood, we prefer), with the growing part pointing downwards—standing, as it were, upon its head. We have frequently seen it placed in an upright position, but all attempts to so grow it have ended in its death; in fact, the plant would appear to be a somewhat refractory subject, even when treated in the best manner. Few persons can point to their plants and say that they have bloomed them half-a-dozen years in succession, but in some instances this has been asserted with a good deal of truth, and when such is the case, no more beautiful and pleasing flower can be found. Some people grow this plant in shallow pans, but we greatly prefer the block system of culture. It should thrive well in the Cattleya-house during the summer months, treated to a somewhat shady position, and supplied with a large quantity of water; but in the winter months it should be kept cool and dry, and if kept in the cool house during this time plenty of moisture will be available from the atmosphere. *Orchid Album* vol. x., part 118.

ONCIDIUM PHYMATOCHILUM.

This plant has been termed a hard one to cultivate successfully for any length of time, and we think perhaps this has been from the want of having it well drained, for we do not think it likes much soil about its roots, neither does it thrive if any water is allowed to lie about it. For this reason we must say that we have seen this plant doing best upon a block of wood, although we have grown it for years under pot culture, using for it somewhat small pots, well drained; and for soil, good upland peat-fibre mixed with chopped sphagnum moss. It thrives in the cool end of the Cattleya-house, with a nice moist atmosphere when growing, but we cannot say that we have found it to like watering overhead from the syringe. The sunshine is quite genial to it when not too strong, but at these times a thin shade should always be in readiness to put over it. When growing, water may be freely given, provided the drainage is kept in good open order, so that it can quickly percolate away. In the resting season, although much less moisture is necessary to its well-being, the surroundings must never be allowed to become dry enough to shrivel the bulbs, for it is a very bad plant to recover, and to bring again into good health if allowed to shrivel up through over-drying. If grown upon wood, it requires extra care to bring it safely through the resting season. *Orchid Album*, vol. x., part 118.

CYMBIDIUM LOWIANUM.

Being of strong growth, and of large-rooting proclivities, it requires ample room for the roots to ramble. Drain the pots well, placing above the drainage material a good layer of sphagnum moss, and for soil use good fibrous peat and light turfy loam, in the proportion of two parts of the latter to one of the former, the whole to be chopped up somewhat roughly with the spade; some sharp sand can also be used during the operation of potting. Do not pot this plant upon a raised mound of soil, but rather pot it far enough below the pot's rim, so as to enable one to administer a good supply of water to the roots at one time, for these plants require a quantity of moisture during the growing season, as well as light sprinklings overhead from the syringe. During the resting season they must be kept fairly moist, and at no time of the year must the soil be allowed to become dry, for in the winter, sometimes early in the month of December, the spikes will begin to push up, continuing to grow till the month of February, or even later; it would, therefore, not answer to keep the plants dry, but during these dull

months the syringe may be laid on one side. The flowers last fully four or five months in beauty after they are open. On account of these plants being such robust growers, many persons have been induced to feed them with liquid-manure, and in many instances we have observed the ill effects produced by this treatment; we therefore strongly urge our readers not to be led away by any specious argument in its favour. When growing, the plant likes the temperature of the Cattleya-house, with a nice moist atmosphere, but when not growing, a temperature of 50° will be ample, but with a drier air. *Orchid Album*, vol. x., part IIS.

ORNITHOCEPHALUS GRANDIFLORUS

Is a dwarf-growing and compact evergreen plant, having leaves of a rich bright green, and a somewhat dense raceme of bloom. The spike, we have observed, is a very long time in growing, but the flowers, when open, last a long time in full perfection. It is best grown in a small shallow basket or pan, so that it can be suspended near to the roof-glass, or upon a block of wood. We prefer the former, because these plants do not thrive so well upon the blocks of wood which we can provide for them as they do upon the growing trees. In the pans or baskets, however, thorough drainage must be provided, and we use for soil peat and chopped sphagnum moss. As with many of these small-growing Orchids, we consider it necessary to advise our readers to watch carefully for the first attacks of insects, and to at once set about their eradication, for if allowed to increase, they will rapidly cause the leaves to become discoloured and fall away, and this, especially with the smaller kinds, is a matter of serious consideration. *Orchid Album*, vol. x., part IIS.

PLEIONE LAGENARIA.

I have some pans of *Pleione lagenaria*, which have come into bloom unusually early this year. Previously I have flowered them in November, but with the same treatment they are now fully open, and larger more brilliant flowers than ever I have seen; also in several instances I have two flowers on one stem. Is this not uncommon? The pans are 5 inches in diameter, and I have already twenty-five blossoms in one pan, and others yet to expand. I believe the fine weather experienced during the past summer is the cause, and should like to know if such plants have been affected elsewhere in a similar manner. *Thos. P. Watson*.

FRUIT REGISTER.

APPLE GRAHAM'S "ROYAL JUBILEE."

This Apple commemorative of Her Majesty's Jubilee is well deserving of the name it bears, and it is equally worthy of the name of the noted firm, Messrs. George Bunyard & Co., Maidstone, the introducers of it into commerce. It is sure soon to attain to a prominent position in all collections of Apples, being a good grower when worked on a free stock, and its productiveness increases with age. The fruit is of handsome appearance, large (fruits from a young tree, three years old, measuring nearly 13 inches in circumference), somewhat conical in shape, with a large eye placed deep in the basin, of a pale yellow colour, sometimes slightly flushed on the sunny side, the quality very fine. The crop is fit for use this year at the time I write (September 26), but in ordinary seasons it would be four or five weeks later in ripening.

BEDFORDSHIRE FOUNDLING APPLE.

This large handsome long-keeping Apple has borne a fine crop of full-sized fruit with me this year, the fruits averaging 13 inches in circumference each, whilst Blenheim Orange, growing in the same orchard, is much below its usual size, being only 10½ inches in circumference. The fruit of Bedfordshire Foundling is greenish-yellow on the shaded side, and suffused with orange and sparsely speckled with reddish-brown next the sun. The flesh is tender and juicy, with a pleasant sub-acid flavour.

The tree is a free and vigorous grower, and is generally a sure bearer; and therefore it is one that should be included in every collection. *H. W. W.*

EMPEROR ALEXANDER APPLE.

This comparatively new and very excellent and showy culinary Apple is about the same size and shape as Bedfordshire Foundling, but it has a shallower and smaller eye, and the fruit is highly coloured next the sun. The tree is a vigorous grower and a free bearer. As an exhibition Apple it has few rivals. *W.*

HARDY FRUIT AT EXHIBITIONS.

THE extensive cultivation of hardy fruits under glass, such as Apples, Pears, Plums, Cherries, &c., beside Peaches and Nectarines, renders some material change in the making of classes for all these fruits essential in the case of exhibition competitions. The other day at Earl's Court, outdoor Apples, Pears, Plums, and Peaches stood no chance whatever against indoor fruits, even though the former were ever so good. The somewhat artificial finish which glass culture gives to these fruits, as well as adding to size, naturally dominates over the product of full exposure; and whilst it is but right that the best should win, it is obvious that there can be no fairness in competitions so long as indoor and outdoor fruits are placed on the same footing. Is it not time that in any schedule in which hardy fruit classes are included, that emphatic distinction should be made, from August 1, at least, between the two classes of fruit. When suggestions of that kind are made, it is pleaded that no one could enforce the regulations against dishonest exhibitors. I think it would be time enough to make a sort of wholesale indictment against the integrity of competitors when occasion arose; but at least most growers are honourable men, and if there were classes of Apples or Pears, for instance, restricted absolutely to indoor or outdoor fruits, they would respect them fully. Under the present conditions, growers who may have the finest of outdoor fruit, yet find no satisfaction in competing, because they cannot hope to beat the house-grown samples; the result is that competition is strangled. In the same way, it is far more meritorious to obtain a fine crop of Peaches outdoors on walls than it is under the easy method of production which houses afford, and yet the ability shown in the former work is thoroughly sat upon, because at competitions the finer indoor fruits will win. Is that the way to help promote the better and wider outdoor culture of Peaches? Surely, after August 1 it should be the rule to have one class for indoor-raised fruits, and one for outdoor samples.

It seems almost needless in the case of Apples and Pears to go yet further. We have need in the former case for discriminating between those grown on walls, or on horizontal cordons, those grown on bush-trees, on the Paradise stock, and those grown on either young or old trees as standards in orchards; whilst it is to the latter form of tree we must look always for the production of the vast portion of the Apple supply of the kingdom, the finest fruits from these trees have no chance at exhibitions against those on walls, cordons, or highly fed and mulched hush-fruits, where they are well thinned, and the production of size for securing prizes is perhaps the primary feature. For the sake of gratifying a love for the sensational, we may at exhibitions like to set before the eyes of visitors some giants produced under those conditions, but they no more represent the average samples of Apples than a Huxley does the average scientific knowledge of the community. If we would encourage hardy fruit-culture as a national industry, we should show some favour to the pursuit at our shows, and not give all to fruits that are the products far more of artificial than of natural and ordinary modes of culture. I have no wish for a moment to offer any obstacle to the production and exhibiting of these huge and wonderful samples. Let us have them by all means, only in their proper

classes. There will then be a chance for every grower of good fruits to share with some equality in the competitions. *A. D.*

NOTES FROM GUNNERSBURY HOUSE.

THESE gardens are not so generally known to horticulturists as is Mr. Hudson, the successful and painstaking gardener, probably because they are nearly over-shadowed by the larger place known as Gunnersbury Park. When the place was described in our columns of July, 1881, it then belonged to H. J. Atkinson, Esq., but at an earlier period it formed part of the same estate as the park, and at one time it was the residence of Princess Amelia. About five years ago it was bought by the Messrs. de Rothschild, since which time the house has not been occupied, and the gardens are used together with those attached to the park for the supply of the London houses of the Messrs. de Rothschild. The grounds are kept up, and the place is generally well done.

The soil is of a dry, gravelly nature, and the lawns have, therefore, suffered very badly during this dry season. The house, which is Italian, is situated on ground slightly elevated, and looking southwards over a sloping lawn down to a small lake, which is now looking much prettier than formerly, owing to Mr. Hudson having planted some Lilies, Rushes, &c., which have broken the straight bank that looked so formal and uninteresting. There are many fine Conifers and trees, but some have suffered much from the character of the soil, and from the exposure to which many of them are subjected from the east. Near the house is a very fine specimen of *Magnolia conspicua*. We do not know where a finer exists. It blooms well each year, and is a magnificent sight in seasons when the spring frosts do not harm it. At the present almost every shoot is terminated by one or more buds, very much developed, and with the perfect flower visible upon cutting the bud into halves. In this state it will remain during the winter, and no frost that may occur during that time will harm it, so thoroughly well protected is it by thick coverings. It is only injured by frosts when they occur after the bud has begun to unfold in the spring.

The kitchen garden was looking well. There was a very fine batch of Brussels Sprouts for such a season, and the Celery, Lettuces, and general winter and spring vegetables were present in good quality and quantity. Peach trees were looking first-rate on a west wall, but Mr. Hudson said that they bore so heavily last year, that they have carried a much lighter crop than usual this season. Before the winter begins in earnest, the young growths are all freed from the galvanised wire, and if this is not done, the shoot is injured by cold at every point where it touches the wire. Pear trees used to canker very much in the open, but Mr. Hudson has conquered that evil by allowing them to make more growth; they have evidently acquired a stronger constitution under the extension system.

One of the most interesting features here now is the collection of sweet-scented Pelargoniums. At present they stand outside in front of the house, where they have been growing during the summer. Many who were present at the Agricultural Hall Show of the Royal Horticultural Society, would see some of these fine specimens arranged in a group; some of them are 5 or 6 feet high, and almost as many through, and they are carefully trained symmetrical bushes. One of the best known is *P. radula* and *P. r. major*. Mr. Hudson has this trained on two fan trellises, each of which is just half of a circle, 7 feet in diameter. They are thoroughly well-coloured, and are certainly interesting and novel objects; they will be used as screens, and are very useful for such purpose. *P. quercifolia* and *P. q. minor* are rather strong growers, easily done, and they bear rose-coloured flowers. *P. fragrans* is the nutmeg-scented one, its perfume and appearance are very distinct. *P. denticulata* is a dwarf, close

grower, never needs any stopping, but all the encouragement it can get. The lemon-scented *P. crispum* is a very distinct one, and its perfume cannot be mistaken; the foliage is very close, and the leaves are much twisted and small. *P. filicifolium odoratum* is not easily grown, but it makes a charming plant. *P. capitatum* is rose-scented, and a capital plant; it is said that the foliage of this one is used commercially in the manufacture of Rose-scented perfumes. Then the old Pheasant's-foot variety has a perfume similar to turpentine, and *P. tomentosum* is that of like peppermint. *P. Little Gem* is one of the best for small plants, it is a very close grower, and looks well and keeps well in a 6-inch pot. *P. Lady Heytesbury* is a pretty hybrid, which might do well for bedding; also *P. Shottesham Pet*, which has large dark rose-coloured flowers. *P. Fair Ellen*, an English-raised seedling, is very like *P. Pheasant's-foot*; and *Prince of Orange* has a very fine flower, quite showy in itself. *P. Major Clarke* is a variety much after the *radula* type, but easily distinguishable; it is not a free grower. *Hollison's Unique* is well-known, and produces fine decorative flowers.

Much care must have been necessary to encourage these *Pelargoniums*, many of them anything but free growers, into such large specimens; and besides these, Mr. Hudson, who has evidently great esteem for plants emitting fragrance, has some plants of *Aloysia citriodora* on umbrella-shaped trellises, which might be useful for table decoration if the scent does not prove too powerful.

In some lean-to houses were nice batches of Ferns, *Bouvardias*, and *Crotons*, and in another some nice dwarf plants of *Carnation Winter Cheer*, just commencing to bloom; also some plants in flower of *Mrs. Cannell*, a very good rose-coloured bloom, darker than *Miss Joliffe*, and a very useful variety. In this house is a large tree of *Napier Nectarine*, which covers the roof. The tree abounds in thin well-ripened wood, which bears very freely, although some growers would prefer stouter shoots. In the greenhouse were two large baskets of *Asparagus decumbens*, a very graceful plant so used, and one that requires renewing but seldom. In another small lean-to are the only *Orchids* grown here, consisting of a few *Dendrobiums* and a very large plant of *Lælia purpurata*; they stand beside a batch of young *Ixoras*.

The Vines were looking first-rate, but most of the fruit had been removed. A few good bunches of *Black Alicante* were still hanging, and some capital bunches of *Hamburgs* in size and colour, told of the good character of the general crop that had been taken. The later varieties, such as *Lady Downes*, *Gros Maroc*, and *Gros Colmar*, were also hanging. Mr. Hudson has inarched *Lady Hutt* on to a *Muscat*, and the fruit, though not so rich as a *Muscat*, is very fair in flavour, and, of course, it will keep much longer.

Mushrooms are grown in quantity in the spacious old wine-cellars of *Princess Amelia*. Mr. Hudson has no difficulty in producing these, and he keeps up a supply the whole of the year. There were plenty of excellent *Mushrooms* ready to cut at the time of our visit, and other beds showing a succession, that will well provide for the next few months.

these British firms, and great care is exercised in selecting the choicest wood. Burmah wood has still the best reputation in home markets, but there is now nothing to choose between the two.

The preference is certainly to be given to Siam as regards cube average and length, the former of which occasionally reaches 50 feet, and the average length is seldom below 28 feet. The shorter lengths of 15 to 20 feet seem to be plentiful in Burmah cargoes, which is due to the fact that the forests of the Burmah side are probably more exhausted than those of Siam. When the improved quality of Bangkok shipments become more generally known to buyers in London and on the Clyde, Siam Teak will doubtless be more in demand than that of Burmah.

Of the British firms engaged in the Teak trade, in which a large amount of capital has been invested, two have leases of forests in the north, and have been obliged to advance large sums of money to foresters for the purpose of working out the wood. With price at £9 10s. per ton, and stocks in London going off rather slowly, the prospects of the Teak merchants are not particularly encouraging.

THE LEMON-SCENTED BUCKLER-FERN (*Lastrea montana*).

It is a singular fact, that ninety-nine people out of a hundred express surprise when told that one of our native British Ferns is powerfully scented, so strongly indeed that it is a matter of astonishment to those who know it, that some commercial use has not been made of it by the perfumery trade. In many parts of England, Scotland, and Wales, the Fern in question, *L. montana*, grows so profusely upon the hill-sides, its favourite habitat, as its botanical name indicates, as to give a distinct colouring to large stretches of the landscape, the experienced eye easily discriminating its lighter green from the darker tints which distinguishes its frequent neighbour, and a frequent rival, the common *Bracken*. At first glance the Fern bears a decided resemblance to the common *Male Fern*, with which it is often mixed, but a closer investigation reveals material differences. In the *Male Fern*, for instance, there is a long naked stalk for some inches before the pinnæ begin, and of these the basal ones are an inch or more long, the frond thus beginning squarely. In *L. montana*, however, short pinnæ begin quite close to the ground, so that the frond tapers all the way down from about two-thirds of its height, narrowing thence to the tip somewhat more abruptly. Then, too, it will be seen that the undeveloped fronds forming the crown are quite white, while in the common *Male Fern* they are clothed with brown scales; the colour is also a yellowish-green, as distinct from a decided green; and finally, if any doubt can yet remain of a frond being lightly drawn through the hand, the strong characteristic lemon odour becomes apparent by the rupture of the little glands in which it is contained. Its habit of growth is erect, each crown throwing up some six or seven fronds of about a yard in height, and arranged shuttlecock-fashion around it; in time, however, numerous offsets become established, so that an old plant may form a dense bush a yard or more through, and as these in congenial localities completely cover the ground, the variety-hunter has to keep a vigilant eye open if he wishes to be successful in his quest. In the earlier days of British Fern study, the wild varieties remained so persistently in the background, that for years the species was considered to be invariable; but presently the perseverance of several hunters, and chiefly the late Mr. Barnes of Levens in Lancashire, began to be rewarded by the discovery of several, and at length of many very beautiful and distinct forms, crested, plumose, and curious, and in many cases of quite distinct types of variation from any of the other species, *L. m. Barnesii* to wit, as the whole frond narrowed to less than a third of normal width, with the side-divisions set on at right angles to the stalk-like steps.

Mr. Barnes used to relate that on finding several

large plants of this unique variety on one of his expeditions, he was so overcome by his feelings as at first to be incapable of digging it up, its unlikeness to anything he had previously seen being such that he thought it must be a new species. Since then Mr. Whitwell, of Kendal, another ardent hunter of the same species, has found very similar narrow forms, but hardly showing the step-like character so clearly. *L. montana*, singularly enough, though on these exposed hillsides every chink and crevice teems with seedlings, is very difficult to raise culturally from spores. Mr. Barnes is the only one who has succeeded in adding new forms by selection. After some score of years search, he was rewarded by finding a crested form bearing tassels at all the tips, and from this he raised *L. m. ramocoronaria*, *L. m. coronaria*, and a *grandiceps*, in all of which this character is much accentuated. Mr. Smithies also found a finely tasselled form, and the writer was fortunate enough to add another from Dartmoor. Several true plumose forms have been discovered in the Lake district, where, indeed, the majority of the varieties have been won, the latest local list embracing some sixty odd. When accompanying Mr. Whitwell recently for a hunt in Kentmere, near Kendal, he found an attenuate caudate form, and one with an extremely long forked tail on the tip of each frond, a very curious freak, but hardly a beauty as found; the writer found a large plant of peculiarly foliose character, and a specimen of the ubiquitous *truncata*, in which all the terminals appear to be bitten squarely off, the midrib protruding as a Thorn. This very singular variety seems to crop up everywhere where the species is common; we ourselves have found it several times in various places in Scotland and the Lakes, Mr. Wollaston at Chislehurst, Kent, and in Westmoreland the hunter now ignores it, dubbing it the "beginner's variety," since every tyro commences by begging it as a prize. A not uncommon variety in that district is *variegata*, in which the fronds are appropriately splashed with bright lemon-yellow, as if it were trying to put on a tint consistent with its fragrance. Mr. Gott, of Kendal, found a splendid congested form, one of the finest varieties we have seen; and Mr. Stewardson's *concinata* has all the side divisions twisted into little curls. The Fern is found very widely dispersed, specimens having been found by the writer in Epping Forest in quite recent years. Kent has it sparingly, in *Sussex* (Tilgate Forest) it densely covers the hillsides, also in the Lake district; while in the western counties it is by no means a rarity, fringing the streams and dotting thecombe sides with innumerable handsome plants. Its favourite soil is good yellow loam in well-drained situations, but not dry ones. Elevated hillsides, not far from the clouds, form its chief stronghold; in lower situations it fringes the streams. Clearly in its natural home it stands the full brunt of the sun, and hence it can be easily cultivated in many gardens, irrespective of shade, always provided its roots are not allowed to suffer from drought. Under glass it is apt to get drawn, but with plenty of light makes pretty specimens. Notwithstanding, however, this ease of culture, it is a curious fact that it is very rarely utilised as it deserves, as our opening remark proves. *Chas. T. Druery, F.L.S., F.R.H.S.*

A TRAVELLER'S NOTES.

(Continued from p. 395.)

ASCENT OF FUJI-YAMA.

I HAVE just concluded a journey on and around Fuji-san—better known as Fuji-yama. It is, as everybody knows, the most beautiful, the highest, and the most famous mountain in Japan, rising on all sides in an unbroken sweep from a somewhat extensive plain, to a height which has been variously estimated from 12,331 feet to 12,437 feet. It dominates all around it. From its summit, at sunrise, lakes, towns, provinces, mountain ranges, and the ocean are all visible, though in a few hours these are often obscured by billowy masses of dense white vapour of indescribable splendour. Occasionally a break occurs, and a glimpse is caught of the plains below; but it is rare. The mountain is

celebrated for these cloud effects—truly a most impressive sight—several thousand feet below a sea of cloud, nothing else and nothing more, the only land in sight the peak on which you stand—"the only island in the world," as an authority has put it. The continuous change of form, the rapidity of motion, the calm, isolated peak, rising majestically above the constant turmoil, all combine to give splendour to the picture.

For only two months in the year, in the height of summer, is the entire ascent possible. Large rifts of snow are present all the year round, and the temperature at night is often little above freezing point, though in the plain below it is between 70° and 80°.

The crater of the volcano, quiescent for many years, though by some not considered extinct, has been variously estimated at depths varying from 416 feet to 584 feet. In diameter it is close on 2,000 feet, and is surrounded by a complete circle of sharp peaks.

From Gotemba the ascent can be performed for the first 6000 feet on horseback, but I preferred to do it on foot.

Starting at 2 P.M. one afternoon with an interpreter and two coolies, carrying food, clothing, &c., and travelling at a leisurely pace, we reached hut No. 4 at 6.30 P.M., where we stayed the night. I must here digress to mention that Fuji is divided nominally into ten stations on those sides which are accessible, No. 1 station commencing about 6000 feet elevation, or from the point from which it is necessary to send horses back. Nominally it is thus divided, but all stations are not kept up.

After leaving the railway-station, for an hour we passed over level ground well-wooded and sprinkled with wild flowers, before we reached the foot of the actual ascent.

In this stretch I saw many plants that occur also in Corea, *Pueraria Thunbergiana*, *Pinks*, *Campanulas*, &c., *Bocconia cordata*, and *Hydrangea involucrata punctata* were flowering and seeding freely; *Clematis*, *Diervilla*, *Tiger Lilies*, and *Scabious*, were all flowering and common. *Retinospora obtusa* and *Cryptomeria japonica* were the most noticeable Conifers.

Over a slightly rising, undulating plain, under coarse grass with nought but a few Pines and stumpy vegetation generally, we wended our way for the next 1500 to 1700 feet to the commencement of the forest, a forest thick and rank, but with no individual specimens of great size, *Tsuga Sieboldii*, *Larix leptolepis*, *Pinus Thunbergii*, *Lindera obtusiloba*, *Spiræa Andromeda*, *S. japonica*, Oaks, and a few Maples, chiefly *rufinerve*, were noticeable.

Larix leptolepis is worthy of a special word. It grows on the plains, and is the tree found at the highest elevations on the mountain. On the south and east sides I have personally observed it at 8000 to 8500 feet, a scrubby stunted bush; at from 2000 to 4000 feet it forms good trees, with trunks 2 to 2½ feet in diameter; and on the plains, though scarcely attaining that size, the specimens are of even and shapely form.

I may mention of the three sides I ascended (or descended) the mountain, that from Gotemba, though the least arduous and the one most usually selected, is decidedly for me the least interesting from a horticultural point of view, the path is composed of loose ashes somewhat fatiguing to traverse.

Beyond 8500 feet, the only vegetation are scattered pieces of red or white flowering *Polygonum* and a very handsome *Thistle*, which thrive in the bare ash, to within some 2000 feet of the summit.

From 8000 feet to the summit a smooth, sharp incline of ashes, a dull purple, or reddish-purple in colour, broken occasionally by the *Polygonum* or *Thistle*, is all that is to be seen; the narrow path trodden firmly by the feet of thousands of pilgrims, is visible nearly all the way, as it ascends nearly straight with but slight deviations.

At every hut it is usual to stop to rest both the coolies and oneself. These huts are of wood at first, but near the summit they are composed of lumps of lava lined with boards. The one in which we passed the first night was some 10 yards by 20 yards, looked after by one woman. It possessed a floor, a door, a fire, and no chimney. Ten men beside myself lay there; the men presumably slept, but insects engaged the major portion of my attention. The door was carefully shut at 8 o'clock, and not opened till 3 o'clock next morning. It then seemed to me somehow that the atmosphere was inclined to be a little thick.

After breakfast we proceeded over the waste of fine ash, a monotonous, wearisome climb to the summit. As we neared it, large boulders became frequent, over which it was often necessary to climb. Early

in the morning my interpreter began vomiting, and at last got so weak, he could not go 50 yards without resting. This much delayed us, and we did not arrive till 5 P.M. The interpreter ate nothing at all; on reaching the hut he lay down, fell into a heavy sleep, and was delicious through the night. He ascribed it subsequently to the rarified air, but I was loath to believe this, and thought it only fever.

However, soon after reaching the summit, I had sharp pains in the back of the head, which continued through the night, and did not vanish till I reached the plain next day. I also noticed the lower we got, the better the interpreter seemed to be, and half-way down he was again able to eat. I am therefore forced to think the change from the heat below to the cold above must have been the cause of his sickness. Another man in the hut that night was in the same condition as the interpreter, and I am informed many Japanese suffer in that way on making the ascent. On the summit are colonies of priests, and numerous huts and small temples of the Shinto faith. On the Gotemba side, three huts and a small temple form a square; all are built up with blocks of lava. In the hut that night, also with a fire and no chimney, were fifteen men; they lay in rows, head to feet—that is, as you looked down a row, first you saw a head and then feet, and so on. I lay in one corner, rather apart, on thick quilts, rich in animal life. Beside me, the interpreter, talking away all night merrily; beyond, the other sick man, who was good enough to be silent. I think I wrote the atmosphere was thick the previous night, on the morning of this one it was positively solid, for which the fire was chiefly to be thanked.

The sunrise was fairly good. I once had to get up on the Rigi at some fearful hour to see one, and was struck by the similarity of my feelings on both occasions. Skirting the crater, we began the descent at 6 A.M., facing due east, our ultimate point on the plain being the village of Yoshida; below us in the distance we could discern it—a small blotch on the landscape. The descent was sharp, our coolies quitting the trodden path, and taking long strides through the loose rolling ash, straight down the mountain side. The ash, some 6 inches deep, helped to carry us down, and we progressed at a rapid rate for some 4000 feet, leaving the interpreter far behind. The feeling was most exhilarating, but the strain on the muscles of the legs is too great, unless one is used to it.

After a short rest, we entered the forest, or, rather, the low vegetation which soon led to the forest—quite different, and to me more interesting than that on the south side. Some flowering grasses were pretty at 8000 feet, and a large *Campanula*, *C. punctata*, very common; it flowers with equal freedom on the plains, and is much like *C. Medium*, varying in colour from white to pink. Birch and *Rhododendron* were also noticeable. At 6000 feet, *Tsuga Sieboldii* began, and was met with in quantity all the way down—handsome trees, attaining a height from 70 to 80 feet, and covered with last year's cones. At a short distance beyond I came to *Abies Veitchii*, and of this the forest was mostly composed. On account of the close proximity of the trees one to another, handsome specimens were rare, and even when the tree had a chance to develop, it grows tall and slender. I can scarcely call it symmetrical, though, at the same time, on account of the closeness of its rich dark foliage, so silvery beneath, the effect is very grand. *Veitch's Manual* mentions specimens 100 feet high. Possibly, on the northern mountains, *Mariea* saw it this height. On *Fujiyama* the average I noticed were from 50 to 60 feet. Trunks lay about, felled by Nature's hand, which must have been taller. *Picea Alcoquiana* is not so frequent on this side as on the Gotemba side. As all students of our Conifer literature know, it is a regular and handsome tree. *Rodgersia podophylla* forms a considerable percentage of the thick undergrowth in parts; tons of it could be collected without difficulty. Its leaves are often little short of 2 feet in diameter.

On this side the huts are more pretentious, and usually have a little temple attached, at which we sometimes saw one or another of the many hundreds of pilgrims we met muttering their prayers. Women seem rarely to make the ascent; I noticed but three. These huts are buried in the *Abies* forest. The trees rise on all sides, magnificent in their severe and silent grandeur. The path is steep, and often rough, and I was not sorry to reach the bottom station, where horses are obtainable to carry one to the village of Yoshida, 7 miles distant.

Passing first over slightly-falling ground, hidden by long grass, and innumerable flowering shrubby and

herbaceous plants, *Anthericum*, *Heimerocallis*, *Platycodon*, *Campanulas*, *Pinks*, *Scabious*, and low bushes of a *Desmodium*-like plant [This is *Lepedeza Sieboldii*], *Lychnis grandiflora*, and *Nerine japonica*, we soon reached level ground. I may here mention I do not understand my father not having met with *Platycodon Mariesii*, *Rodgersia podophylla* or *Clerodendron trichotomum*. Presumably, with the first and last named, he did not leave Yokohama during their flowering season; and with *Rodgersia*, it is probable he ascended and descended the mountain at the Gotemba or south side, where I did not meet with it. *James H. Veitch*.

(To be continued.)

SALPIGLOSSIS.

Those who have not grown this pretty, tall-growing annual have missed a treat this season, for I have never observed them so fine or floriferous before, the hot and dry weather just suiting the plant. A long row in the kitchen garden at this place has been much admired. The variety, *S. variabilis grandiflora* gives a great range of colours, including the pencilled, intensely dark blue, chocolate, and various shades of yellow. Many of the plants grew to 3 feet in height, and a quantity of side-shoots, which flowered freely.

It is a mistake to afford the young plants much heat, as it draws them up weakly, and spoils their growth, for once an annual plant becomes long-jointed, no after-treatment will make it stocky and sturdy. By sowing the seed early in March in a cold frame, and pricking out the seedlings directly they are large enough to handle, in a temporary shallow pit, stocky growth is secured, and the foundation laid for future success. By lifting the plants carefully with soil attached to the roots, and choosing showery weather for planting them out, success is fairly certain, unless the season is unusually wet and sunless. *E. M.*

PLANT NOTES.

SPIRÆA CALLOSA ALBA.

This is a charming subject to grow on the rocky; and in spite of the past hot and dry summer this plant is making a capital display in a nook of our rockery. It does not grow here more than ¾ to 1 foot high at the most, as the shoots are cut off close to the ground every year. The young vigorous growths springing from the base give stout heads of pure white blossoms just at a time when flowers are not plentiful on a rockery. *E. M.*

ALONSOA WARSCEWICZII COMPACTA.

This half-hardy annual is not well known, and consequently not extensively grown, as it undoubtedly deserves to be. Grown in beds by itself, or in patches in the mixed border, it is very effective, the racemes of bright scarlet flowers and dark green serrated foliage showing to advantage in either case. The plant is a good grower and free-flowerer, and in ordinarily rich soil it attains to a height of from 12 to 15 inches, and the flowers are useful and effective for the embellishment of small vases or glasses, and in which they keep fresh a long time with the stems in water. *W.*

ALONSOA LINIFOLIA.

The only difference worth noticing between this half-hardy annual and *A. Warscewiczii compacta* is that the former is 6 or 8 inches higher, and has long narrow leaves. It is well worth growing. *W. H.*

MAURANDYA BARCLAYANA.

Plants of this effective climber, raised from seed sown in the spring of this year, twining round the stems of some of the standard Roses in the flower, are very telling just now, the loosely hanging shoots of purple flowers and pale green leaves showing off to advantage on the once bare and unsightly stems of the Rose bushes. The plant is also very telling in effect, growing in 6-inch pots for

standing on the side staging in a greenhouse or conservatory, with the flowering shoots hanging over the edges, being equally suitable and useful for planting in baskets suspended from the roof, with the twining shoots of flowers and foliage depending therefrom. It is also a capital plant for covering a trellis or lattice-work in either of the structures indicated. *W. H. W.*

AMERICAN PARKS AND GARDENS.

WHAT THE CURATOR OF THE ROYAL GARDENS AT KEW SAW IN THE UNITED STATES.

GEORGE NICHOLSON, Curator of the Royal Gardens at Kew, who has been spending rather more than two months in this country, sailed for home a few days ago. Mr. Nicholson was appointed a judge of horticulture at the Columbian Exposition for Great Britain by the Royal Commission, and he spent a month at the Fair in his official capacity. In conversation on the subject of his visit just before he sailed, Mr. Nicholson said, in reply to some questions:—

The Arnold Arboretum.—"My specialty, however, is trees and shrubs, and therefore the place to which I went first and where I stayed longest was the Arnold Arboretum in Boston, and of this unique institution I can hardly speak without enthusiasm. I know of nothing just like it. There are other arboreta in the world, but they are all subordinated as annexes or dependencies to botanic gardens. This is a true arboretum, devoted to trees and shrubs exclusively. It is young yet, but it is conceived on a broad scale, and the foundations are laid wide and deep to admit of growth and expansion, so that ultimately every tree and shrub capable of cultivation in the climate of Boston will here be found, and it already contains the most complete collection yet made of shrubs which are hardy in the North Temperate Zone. Of course, all the plants are arranged systematically, according to their botanical sequence; but the natural advantages of the place, with its beautifully undulating ground, are made the most of, so that splendid landscape effects are produced. The margins of the roadways are planted with shrubs, which give beautiful effects the year through, with flowers in spring, rich foliage in summer, and coloured leaves and fruit in autumn. And these shrubs are used with such profusion, that one may find more individuals of certain species here than can be found in all the other botanical gardens of the world combined. Besides its scientific value, this great collection is so arranged as to present one of the very best lessons in natural planting that can be seen anywhere. In addition to this planting, there are many acres of natural woodland, in which are old trees and a thrifty young growth to furnish object lessons in practical forestry, and near one boundary there is a steep slope clothed with an ancient Hemlock wood, which gives a feature which cannot be matched in dignity and beauty in any park with which I am acquainted.

"In the systematic plantations every single specimen was raised on the grounds, and a complete record is kept of them. On a carefully-formed map the position of every tree is marked, and reference to the unique card-catalogue will give a complete history of every plant, so that the student will know when the seed was planted or the cutting was rooted; or, if it is grafted, where the stock and scion came from, together with an account of its size or habit every year, and any peculiar circumstance connected with any stage of its life. I know of no other establishment where records of this kind are made, so that the catalogue which is useful now will grow in value as time goes on. But perhaps these details are all familiar to you."

Mr. Nicholson was assured that Americans, as a rule, had perhaps as little familiar acquaintance with the arboretum as Europeans, and he therefore continued: "Well, all your people ought to know that in the museum at the entrance to the arboretum is a herbarium devoted to woody plants

which is unrivalled, and that here, too, is the best working dendrological library in the world. Of course, you do not need to be told how Professor Sargent, the Director of the Arboretum, stands among men of science, but I can only add that his position is recognised by every European botanist of rank, and, in a way, through the Arboretum, he is doing a great deal for Europe as well as for America. He returned last autumn from an extended journey in Japan, bringing with him the seeds of more than 300 species of plants. Perhaps a hundred of these have never been under cultivation, and tens of thousands of plants from these seeds are already established, and they will be distributed from the Arnold Arboretum to enrich the gardens, not of America alone, but of the entire Western world. This is nothing new, for already many of the most interesting ornamental plants in use have been disseminated from this same source. In his office in the Museum Building, Prof. Sargent is writing his great work, *The Silva of North America*, which contains a description of every tree growing in America north of Mexico, and which I consider the most important contribution of the century to dendrological literature. In this work Professor Sargent has the co-operation of Mr. C. E. Faxon, one of the arboretum staff, who is unrivalled as a botanical artist. Professor Sargent is also the director of *Garden and Forest*, which is, in a way, the illustrated organ of the arboretum, and therefore contains much original information as to trees and shrubs, and is a horticultural journal of the highest class in every way. For example, the series of letters now running in this publication, descriptive of his Japanese trip, contains a summary of all that is known of the forest flora of Japan up to this date. It is well known that these islands are rich in arboreal vegetation, and from their position, facing the Pacific, as your own shores look out upon the Atlantic, they produce trees under similar conditions to those of North-eastern America, so that many of the trees which Professor Sargent has brought from Japan will doubtless grow on the eastern shore of the United States better than they will in Europe." *New York Daily Tribune, Sept. 10, 1893.*

(To be continued.)

FORESTRY.

ARBORICULTURE IN THE SOUTH AND SOUTH-WESTERN COUNTIES.

No one travelling in a south-westerly direction from the metropolis can fail to notice the vast areas of bare land without a tree or a hedge, but occupied by immense numbers of sheep; these are the great chalk downs. But in the low-lying and more fertile land, it will be noticed there are a great number of copses planted with Oak and Hazel, to meet the requirements of the sheep farmers, who occupy the downs as sheep farms. The system of forest management is totally different to what is carried out in any midland or northerly district.

The chief requirements of these farmers are hurdles for folding purposes, and to meet the demand, the woods are planted sparsely with Oak and other forest trees, but filled up to about 3 feet apart with Hazel, Ash (and Willow in wet places) as underwood. In October, when the underwood has reached maturity, which, in the case of hurdle-making, is considered best at about eight years old (but the first cutting over is not of any great bulk), it is usually allotted out into plots of from 2 to 4 acres, and either sold by private treaty or public auction (the latter is mostly the practice) to wood-brokers, who in the first place (after the wood is cut down) cause all the wood suitable for hurdles to be laid on one side for the hurdle-maker, who charges 3s. per dozen for making them. The next class of wood is split up into spars for thatching purposes, and what is large enough is bundled up for broom-handles, the refuse either going for fagots for household purposes or made into smaller ones, which find a use at brick kilns.

The prices obtained per acre in the first place, for

the wood, ranges from £4 to £8, sometimes as much as £12 has been realised for some of good quality. This, like other things, has much gone down in value, but, at the same time, a good fair piece of underwood pays a landowner better than some of his farms. The usual price of burdles is 7s. 6d. per dozen, which also includes one shore or stake to each hurdle, for erecting and fastening it. Thatching rods or spars are split up, and sold in bundles of one thousand at from 2s. 6d. to 5s. per thousand, according to length. The margin of profit may appear small, but wages are rather below the average in the district, and the men make a satisfactory living at the work.

In the spring following, the coppice presents a trim appearance, every sprig being collected together and tied up. Nothing but the forest trees are to be seen, and advantage is then taken, where necessary, to thin out Oak for bark stripping. But this latter system is carried out rather too severely to my mind, as I do not consider that Oak and other hardwood trees in a plantation require to be thinned every eight years. The cause is, I think, in many cases that Hazel and other underwoods make an earlier profit, but the filling up of vacancies with forest trees is much neglected by the owners. By the next autumn it will be observed that the underwood has made considerable growth, and the owner is now able to discover the whereabouts of the stools, and to fill up any vacancies which may appear in the underwood, and at the same time introduce an occasional forest tree in any case where it could be done without overcrowding, the young Hazel acting as nurse plants.

In renovating and planting-up an old plantation, I have found it practical economy to make the pits oblong and of good size, and to plant two or more underwood plants therein at the ends of the pit, as in most cases it will more quickly form a stool, or should one die there would still be one left.

Rabbits commit great depredations in young-growing wood, especially of the second year's growth, and should be kept down, or wire-netting fixed around the plantation to keep them out of it. Spanish Chestnut is of no use as an underwood plant in this district, as it will not work-up; it should, therefore, be discarded here, although in some parts of England nothing more suitable or profitable can be grown. *J. Garbett, Canford Woods.*

PLANTS OF THE PHILIPPINE ISLANDS.

We extract the following notes on the flora and products of the Philippine Islands from a report recently furnished to the Foreign Office by Mr. Consul Stigand, dated Manila, July 24, 1893:—"The flora of the islands would require a long chapter for proper treatment. There is a great absence of flowering plants, and those which do flower have, as a rule, very small flowers, and the absence of odorous blossoms is as remarkable as the absence of singing-birds. Flowering Orchids are abundant, both in variety and quantity in the forests, but in the towns a fair-sized plant of an ordinary species cannot be procured under 1 dollar, or about 3s. By the roadsides near Manila the principal trees to be seen are the tall and graceful Betel-nut Palm, Bamboo, Bananas, and other tropical trees and plants. Vegetables—Beans and Peas, for example—are grown here by covering them up from the sun with trellis-work covered with Banana and other leaves; but most of the vegetables are brought from Hong-kong. There is hardly any eatable fruit but Mangoes and Pine-apples, the latter growing as commonly as weeds. The Sugar-cane, Coffee-plant, Abaca or Hemp (*Musa textilis*), Tobacco, Maize, and Rice, are the plants chiefly cultivated. As for the woods of the country, their nomenclature forms an immense list; and the better kinds of woods are too little known. Some of these woods are excellently suited for furniture, especially the 'Narra'-wood, which has the look of Mahogany, but is not so close in grain, while having a lighter colour."

The only outside market for Philippine woods is China, where large quantities are shipped annually, and the hard woods of good length find great acceptance in that market for the building of temples. A wood known as "Camagon," a sort of ebony, is a good wood for ornamental work, but it is defective, owing to the white streaks that run through it. A sort of Boxwood, or *Lignum-vitæ*, grows in the country, but not in sufficient quantity to be of marketable value. None of the Philippine woods have had a fair trial in the home market.

Referring to gutta-percha, a good business, it is said, was done in this article for a few years, but owing to a system of adulteration carried on by the Chinese, the trade has been entirely killed, and scarcely any business has been done for two years.

CULTURAL NOTES.

THE STREPTOCARPUS.

THESE have within the last few years taken a prominent place in the greenhouse, being free flowering, easily raised from seed, and opening their first blooms within five months from sowing the seed. This year, seed which I sowed about January 24, in pots of fine soil, and kept in the house with the lippeastrums, began to flower early in the month of June. The seedlings are very small at first, and require careful handling. It is best to prick out one dozen of them in a small 60-pot; and when they have spread well over the surface, replant in threes in a pot of same size, and when these have rooted through all the soil in the pots, repot them singly, still in small 60's. The plants when small grow best in a cool Orchid-house, or similar place, where the air is kept moderately moist, and the temperature about 50° to 55°.

The *Streptocarpus* is a thorough greenhouse plant, and can be wintered in a house from which the frost is excluded. They will do very well with *Calceolarias*, or any other comparatively hardy, greenhouse plants. The seedlings produce flowers, very much of the same quality as the plants from which the seed is taken. *J. Douglas.*

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

CELERIAC.—As soon as the weather at night gets frosty, it will be necessary to lift a portion of this crop, and store it in sand in a cool place. When lifting, care must be taken not to bruise the roots, or they will decay, nor to cut off the tops close to the tuber, as they must push out a little growth, or decay sets in. When lifting only a part of the roots, alternate rows should be taken, thus affording more space for the remaining plants, and sufficient soil to mould over the roots. Celeriac should be stored in an open shed or light cellar, so that the tops may have light, and they are better when stacked in layers in banks, as Strawberry-plants in pots are sometimes wintered, and the mould should not be very dry.

CAULIFLOWERS.—It will now be necessary to protect all heads becoming fit for use, or frost will spoil them. It is not well, however, to cover them too closely, this having a tendency to cause them to be of over-strong flavour. Cauliflowers raised from seed sown the last month may be pricked out in light soil in a cold frame, the lights being put on only when the weather is very rainy or frosty, air being freely admitted at all other times, or the lights removed entirely.

CHICORY.—This plant is not much in demand till hard weather has rendered other salads scarcer; however, a few heads may now be taken up weekly, the tops cut off within one inch of the root, and planted in some dark moist place—cellar or Mushroom-house. The roots may be planted in a 9 or 12-inch pot, so that the crowns are level with the soil, and afforded a good watering, allowing them to stand in a shed for a day or two afterwards, before placing in the cellar, &c. If this be not done, the young growth may damp off. Light must be quite excluded during growth. No heat need be applied

at present, the warmth of the place being sufficient to cause the plants to grow, and when this is accomplished the leaves are very tender.

SEAKALE.—In some parts frost will have caused the plants to shed some of their leaves; and where this is the case, these leaves should be cleared away from the crowns, thus affording access to the sunlight and maturing them earlier than would otherwise be the case. As soon as the centre leaves part readily from the crowns, the first lot of plants may be taken up for forcing. Growth will not be made freely at this time of the year, and more time must be allowed for the shoots to grow. When lifting Seakale, any roots which are about the thickness of the little finger, should be cut off and laid in mould for planting and sets. If these are made and planted as soon as the ground can be got ready for them, they will start into growth early in the spring. The sets when planted should be covered with earth to the depth of 2 inches, and on heavy land, leaf-mould may be strewn over them.

RHUBARB.—Roots may soon be prepared for forcing, and the best for this purpose are two-year old ones, these throwing up finer sticks than older ones, and they are less likely to flower. The masses of roots and soil may be packed closer together if very large, but smaller masses, such as those which are two years old, may have a little more space allowed them. Roots laid in soil, in a shed facing north, and covered with litter, will commence to grow readily when put into the forcing-house. The Royal Albert is one of the best for early forcing.

GENERAL WORK.—In many parts Runner Beans, Vegetable Marrows, and such-like have been destroyed by frost, and in such cases the ground should be cleared, and manure wheeled on to it in readiness for digging. Leaves of trees should be raked up when dry, and stacked in heaps. Protect tender vegetables at night, as previously advised, and see that French Beans and Peas growing in cold pits do not suffer for want of water, admitting air freely in favourable weather.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

LIFTING AND REPLANTING FRUIT TREES.—Young vigorous trees of Apples, Pears, or stone fruits, the growth of which previous root-pruning may have failed to check sufficiently to cause fruiting, may, at this season, be replanted. If the operation be performed whilst the trees are still in leaf, and the latter are prevented from drooping by affording a good watering to settle the soil about the roots, and subsequent overhead syringings in dry weather, the chances are, that any bloom-buds that may have formed will not be injuriously affected, the warmth of the soil encouraging rooting before winter. The transplantation of other trees may also be carried out in the same manner, if the new stations for the trees are ready for them, and they can be transplanted with despatch. Care should be taken to have all such trees secured to stakes to prevent damage to the roots by wind-waving.

RED CURRANT BUSHES.—Young, over-vigorous bushes may be similarly treated to the above, otherwise the growth will be very strong, and fruit be of poor quality for several years to come; that is, till the bushes have impoverished the soil in which they are growing, whereas the check given to them by lifting and replanting brings about the same result at an earlier period, which, once secured, is maintained by the heavier crops the bushes carry.

GOOSEBERRIES.—These bushes may also be transplanted at this season without fear of losing the crop. Indeed, where the Gooseberry sawfly grub has been troublesome, if a fresh quarter can be found for them, transplanting is a pretty sure remedy, at least for a few seasons; care being taken to carry no old soil containing the larvæ with the roots. Early last autumn, and whilst the bushes were in full leaf, I had a Gooseberry quarter filled with large bushes transplanted, and despite the dry season, every bush removed carried a full crop of berries, and there was no trace of the caterpillar, although in another quarter, only a few yards distant, the caterpillars gave us much trouble in checking their ravages.

FRUIT-GATHERING.—All varieties of Pears, except Winter Nelis, Josephine de Malinea, Glou Morceau, Easter Beurré, Jean de Witte, Bergamotte d'Espéren, Beurré Rance, and a few others, may now be gathered. The late sorts named above should be

left on the trees for about a fortnight longer, and in the event of frost, double-netting should be hung over them. Of Apples, Wellington, Norfolk Bearer, French Crab, Scarlet Nonpareil, Cackle's Pippin, Mannington's Pearmain, and other late varieties should be left on the trees for another week or so, unless frost threatens, when all of them with the exception of the French Crab should be gathered. Quinces and Medlars should also be left ungathered for some time longer, unless a change to much colder weather takes place.

THE FRUIT-ROOM.—The usual fruit-room met with in gardens is much too warm at present to admit of the softer-fleshed Apples, as Warner's King, &c., keeping well, and every means must be taken to keep the fruit-room cool by opening ventilators, especially at night. Frequent examination of the fruit will be more necessary than usual this season, owing to the earlier ripening of the same, and the damage wrought by the tom-tits and wasps, as it is possible for some of the damaged fruits to have escaped notice when storing them.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

CATTLEYA-HOUSE.—Cattleyas, such as Warneri, gigas, g. Sanderiana, those of aurea that have flowered, Rex, Schilleriana, and Aclandia at the cooler part of the house, should be watered sparingly, say, once in seven days, but on no account allow them to suffer absolute lack of water. Cattleya Gaskelliana should be kept dry till such time as growth begins. This species, if in good health, is very free-flowering and a good grower, but it requires a few degrees higher temperature than is needed by other summer-flowering Cattleyas. Cattleya Skinneri and C. S. alba should be well supplied with moisture for some time longer, the new growth not being finished. These two species like rather more warmth and moisture to finish up their pseudobulbs than do others.

DENDROBIUMS.—As these plants finish up their pseudobulbs, and are gradually brought to a state of rest by withholding water, they may be placed in a cooler and airier house. To this section belong D. Wardianum, D. crassinode, D. nobile and varieties, D. heterocarpum aureum, D. Findleyanum, and most evergreen species, including D. densiflorum, D. Farmeri, D. F. albiflorum, and D. thyrsoiflorum; but these plants must not be dried off too severely, or they may lose a number of their leaves, which does not improve their appearance. A few Dendrobies which will need to be still kept in the growing house, not having finished their growths, are Brymerianum, Paxtoni, fimbriatum, f. oculatum, Dalhousieianum, clavatum, and mochatum, all of these taking a long season to mature their growth. With the Dendrobiums, Epidendrum bicornutum, E. radicans or rhizophorum, Oncidium Lanceanum seem to find all their requirements, and the plants now freely growing should have a good supply of water at the roots. Orchids for flowering at this season are not many, and may be found in Oncidium tigrinum, O. Barkeri, O. unguiculatum, O. varicosum, and its varieties, O. Forbesi, O. pretextum, O. crispum, Miltonia Moreliana, Vanda cœrulea, and many Cypripediums.

WATERING, DAMPING, AND AFFORDING AIR.—With shorter days the evaporation of moisture is very much less, and in watering Cattleyas and Lælias, those plants which have finished their growths will need but little. A good guide as to the state of the materials as regards moisture is the condition of the sphagnum moss, if this shows a whitish colour it is then time to afford water, and sufficient should be supplied to moisten the whole of the compost, not merely enough to freshen-up the moss. If the watering be properly done, once a week will be often enough; but the plants should be looked over each morning, and if damping of the new pseudobulbs is observed—as at this season of the year sometimes is the case by reason of moisture getting between the pseudobulbs and the outer sheathing—the cause must be carefully guarded against by the grower in charge of the plants. If the outer sheathing looks at all damp, draw a sharp, pointed knife carefully and steadily up the outer sheathing without touching the new bulbs, and at once let out the water. The damping down of the various houses depends on the form of the houses, some requiring it oftener than others; and the kinds of materials of which the paths, stages, &c., are made

to some extent exercise an influence. In some houses the paths are made of iron or wood trellising, with earth beneath, and staging that does not retain moisture for any length of time; in others there are tiled paths, from which moisture is dissipated in a few minutes; and open wooden stages, from which water runs away at once. Houses so fitted up require damping three or four times a day in the winter months, when fires are going briskly. Houses with wooden-trellis or iron-grating paths and water-tight stages need damping once a-day after this date. Every Orchid-house should be allowed to get dry for a few hours in the middle of the day, and again during the night, but to have them in a very dry state always soon causes mischief to the plants, and a lot of work in getting rid of insect pests. Another secret in good management is the admission of fresh air on all favourable occasions; but in doing so, avoid opening ventilators on that side from which the wind blows. At this season it is advisable to lower the temperature of all houses a few degrees, keeping the Phalænopsis by day at 75° to 80°, at night 65° to 79°; the Cattleyas, by day, 65° to 70°, at night, 60° to 65°, with a rise of 10° to 15° by day if fine, and a drop of a few degrees if very cold; *Miltonia vexillaria* and the intermediate-house, by day, 65° to 70°; by night, 60° to 65°, a few degrees lower doing no harm. East-Indian Orchids, *Dendrobiums*, *Cypripediums*, *Aërides*, *Vandas*, *Saccolabium*, &c., may have a day-warmth of 70° to 75°; and at night, of 65° to 70°, a degree or two, more or less, not signifying much.

THE FLOWER GARDEN.

By T. H. CRASP.

HARDY FERNERIES AND ROCKERIES.—Where the above exist, a thorough weeding and overhauling is needed at this season, all decayed foliage being cut off and removed, but preserving all that is green and fresh-looking, and afterwards pricking up and stirring the surface of the soil with a hand-fork, and making tidy. Where strong-growing plants are grown, such as Ivy, *Vincas*, *Gaultheria*, some thinning out of shoots and runners is necessary, in order to keep them within reasonable bounds.

ROSE BEDS.—The drought and the inability to water efficiently have in many places rendered a good late bloom on Roses impossible, and there remains nothing to wait for; therefore, the transplantation of Rose bushes may begin without delay. On light soils, Roses ought to be lifted every alternate year, renewing the soil, thus checking mildew, and increasing the size of the blooms the following year.

WALKS.—The present showery weather makes it easy to weed and clean walks of a hard nature, and after this has been done, the surface should be made smooth again with a heavy roller. Where hand-labour is expensive or not obtainable, a dressing of weed-killer afforded twice a year will keep walks in good order, but as weed-killers are poisonous, a good deal of care is needed in their use, and tame birds, pheasants, cats, dogs, &c., should not have access to dressed walks for some few days afterwards, nor should the dressing be allowed to reach the living edgings.

GENERAL WORK.—That the flower-beds may be presentable for the longest time, flowers and foliage past their best should be removed at frequent intervals. With regard to very choice or delicate species of *Pelargonium*, these should be taken up at once and potted, the gaps being made good with *Wallflowers*, *Arabis*, or whatever is used for flowering in the beds in the spring. If cuttings of the bedding *Violas* were put in early, these will have made well-rooted plants, and they may be planted out at this season, as there is yet ample time for them to get established before the winter. Plant them at about 9 inches apart each way, pressing the soil firmly about the roots and stem. A last batch of *Pansy* and *Viola* cuttings may now be taken, if the stock of these plants is deficient. Cuttings of *Culceolaria*, *Gazania*, and *Gnaphalium* can now be obtained in quantity; and as this is the best season to propagate them, some cold frames or shallow pits should be got in readiness, as no heat whatever is needed. Having chosen firm short-jointed cuttings, trim them neatly, and prick them out at 3 inches apart in a compost that should consist of loam two parts, and sand one part, pressing this soil closely about each cutting, and afterwards watering it well, but allowing the cuttings to get dry before putting the lights on. Bedding plants recently struck should now be brought under cover.

The *Pelargoniums*, if kept on the dry side, will winter in any light structure from which frost is excluded, but they will lose much of their foliage and softer shoots, unless damp can be dissipated by fireheat and ventilation. If bulbs are to be planted on turf, open spaces amongst trees, and by the sides of the walks, this kind of work should now be pushed on speedily; but if used in beds of shrubs, the latter should first be planted, and then the bulbs. Bulbs require to be planted at various depths, according to their size; small things as *Crocus*, *Scilla Siberica* *Snowdrops* at 4 inches, larger than these at 6 or 7 inches; and in all cases the trowel should be used, or a drill drawn of the required depth, the bottom of the hole or drill being made very firm before planting, as bulbs detest a soft bed, especially beneath or just round about them. If a dibber be used, it should be very blunt at the end, so that a bulb will rest quite at the bottom of the hole made by it. Therefore, when a bed of shrubs, *Wallflowers*, *Honesty*, &c., has been planted first, tread the soil evenly and regularly, and then plant the bulbs.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

USEFUL BULBS AND TUBERS FOR PRESENT POTTING.—The general collection of bulbs for winter and spring flowering should now be potted in the compost previously recommended in the case of *Anemone fulgens*. Six tubers in a 6-inch pot makes a useful decorative mass for a vase or basket; one bulb in a large 60; when well-grown, they are bright subjects for table-work. Of *Allium neapolitanum*, where hardy white flowers are in demand, a good quantity should be grown in various sized pots; they stand a long time in flower, and are useful in a variety of ways. *Crocus* in different colours should be potted in small pots for edging baskets or groups of plants in the festal season; they are very beautiful if put to the number of six in a small pot, as they will then go into almost anything with some fertilising moss in the bottom, and keep in flower a long time in a cool house if well supplied with water.

FREESIAS.—These plants are always in demand at Christmastide, and those potted in August will now be growing apace, and should be kept near the glass in a house from which the frost is just excluded, from which a few pots at a time should be taken and pushed on in a very gentle heat. Keep them free from aphid, and afford plenty of plant-food when the pots are filled with roots.

FRITILLARIA AUREA forces well, and it is easy to grow. It is very bright, and a good plant for decoration.

IRIS HISPANICA is attractive during the early spring months when flowers are scarce; they should also be placed thickly in 5-inch pots, and brought on in batches as required; they come quickly into flower, and are as beautiful as an *Orchid*.

JONQUILS, double and single, than which there is nothing more useful or beautiful when grown in pots. When they are well rooted, push them on in heat as required; they like high cultivation.

GLADIOLI COLVILEI (RED), AND THE BRIDE (WHITE) should be potted for spring-flowering in 5 and 6-inch pots, placing these under coal-ashes with the other bulbs, and when they are taken out of these keep them in a cool-house; they do not like to be forced.

HYACINTHS, SINGLE AND DOUBLE-FLOWERED.—Five-inch pots are large enough for one bulb, and if large potfuls are required, six or eight bulbs should be put into well-drained pots with some manure placed over the crocks; liberal waterings of liquid-manure should be afforded when the plants are growing freely. *Hyacinth* bulbs in glasses should not touch the water, but they should be as near as possible without touching it. Place them in a dark room or cellar till the roots are 3 or 4 inches long, then bring them to the light in a cool place. The *Grape Hyacinths* are very fragrant and beautiful flowers, the bulbs of which should be put thickly into 5 and 6-inch pots, and treated the same as the others.

POLYANTHUS NARCISSUS, ETC.—The various varieties are excellent for spring decoration, and amongst the best are *Bazelman major*, *Double*

Roman, *Gloriosa*, *Grand Primo*, *Her Majesty*, *Soleil d'Or*, and *Queen of the Netherlands*; they are strong growers, and require high treatment. *Convallaria polygonatum* (*Solomon's Seal*) is very useful as a winter decorative plant, forcing well, and it should be potted at this season in pots of various sizes, and placed with the bulbs; its bright green foliage is beautiful. *Scilla bifolia* and *S. sibirica*, and double and single *Snowdrops*, should be grown in good quantities for house decoration. The first batch of *Snowdrops* are always attractive, and they do very well in small 60's, and afford excellent subjects for dinner-table work; they must be grown in a cool-house or pit. *Tulips* in their various colours should be planted, a dozen bulbs in a 7 or 8-inch pot; and one bulb in a large 60 makes a useful plant. *Tulips* are very easy to grow, but they must be kept clean, and not be crowded with other plants when coming into flower. Some of the best varieties for pots are *Duc Van Thol*, *Artus*, *Waterloo*, *Clairmond*, *Duchesse de Parma*, *Pottebakker*, *Vermilion Brilliant*, *Thomas Moore*, *Tournefol*, red; *Tournefol*, yellow; *Imperator rubrorum*, and *Parrot Tulips*.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

EARLY VINES.—Vines intended to fruit at the end of April and onward should be pruned, if that has not been already done, and the house thoroughly cleansed as a preparation for starting. For very early fruiting the close spur system need not be so rigidly carried out as with late fruiters, but if it is found that one can with confidence realise good crops (year by year), by cutting to one or two buds, it is the best system, most simple in practice, and always the most slightly in appearance; the "best bud" system of pruning in time leads to disorder, and we never were so situated as to see any benefit accrue from such pruning. A system of renovating vineries may be of advantage in certain cases, by cutting down an old rod or two annually, and running up young ones in their stead. When spurs are of great length, and the Vines cannot be removed, short well-ripened wood may be turned backwards over them in order to have the bunches near to the rods. If there is any fear of bleeding from the wounds, some styptic should be rubbed over the cuts. Remove loose bark (but do not make bare the stems), and thoroughly scrub the rods with Gishurst compound (four ounces to the gallon of water), or soft soap and warm water. Woodwork and glass should also be cleansed in the same manner, and the surface soil removed to the depth of two inches, and replaced with good loam, with a proportion of *Vine manure*, as recommended by the makers. Better to apply the manure several times during the growing and fruiting season, than give too much at one time. If mealy-bug has become established, mix 1 part of tar to 6 of soft loam, and reduce it to the consistency of paint with water; then rub it carefully over the Vines with a stiff brush, leaving no part untouched. After the houses are prepared for forcing, allow them to remain cool and dry till November, when they may be closed. The chief cause of failure with early crops of *Grapes* is hard-frosting, especially while the roots are inactive; and frost-burning by the too free use of fermenting materials must be avoided.

TOMATOS.—Plants now fruiting should not be cropped heavily, and as soon as the desired quantity is set, pinch out the rest of the blooms. Plants for winter and early-spring fruiting may still be raised in sandy loam by inserting short cuttings into the centre of 3-inch pots, and plunging them in bottom-heat. Plants for winter and spring fruiting should be grown without manure in the soil, and be kept firm in the stems by means of plenty of air and a moderate temperature.

STRAWBERRIES.—I never saw crowns of *Strawberries*, in pots, so prominent as they are this season; and the pots are filled with roots to the point of bursting. If small side crowns appear, these should be removed, and weak liquid manure afforded at every third watering. Starving the plants now, means a weakly show of flowers, which will set badly. The drainage of the pots must be kept clear; or where worms can enter them, they are liable to become waterlogged. If the balls have separated from the sides of the pots, the space should be filled with loam made firm. Plenty of air passing freely among the plants is now of great moment.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, Oct. 10 { Royal Horticultural Society's Committees, at the Drill Hall, James Street, Westminster.
National Rose Society: Horticultural Club.

WEDNESDAY, Oct. 11—East Anglian Hort. Club.

SHOWS.

TUESDAY, Oct. 10 { Kent County Farm Fruit Show,
Corn Exchange, Maidstone (two days).

WEDNESDAY, Oct. 11 { National Chrysanthemum Society,
at Royal Aquarium (three days).

SALES.

MONDAY, Oct. 9 { Bulbs, at Protheroe & Morris' Rooms.
Plants, at Protheroe & Morris' Rooms.
Clearance Sale of Nursery Stock, at the Nursery, Hounslow Heath, by order of Messrs. Chas. Lee & Son, by Protheroe & Morris (two days).
Unreserved Sale of Orchids and Plants, at Silverdale Lodge, Sydenham, by order of W. Cobb, Esq., by Protheroe & Morris (two days).
Dutch Bulbs, Lilioms, French Forcing Bulbs, &c., at Stevens' Rooms.

TUESDAY, Oct. 10 { Bulbs, at Protheroe & Morris' Rooms.
Bulbs, at Protheroe & Morris' Rooms.
Unreserved Clearance Sale of Nursery Stock, Roses, &c., at the Barents Nurseries, Westerham, by order of Mr. Arthur Jeffkins, by Protheroe & Morris.

WEDNESDAY, Oct. 11 { Great Unreserved Sale of Superior Nursery Stock, at Lea Bridge Road Nurseries, Leyton, by order of Mr. J. Fraser, by Protheroe & Morris (three days).
Dutch Bulbs, Dwarf Roses, 30,000 Lily of the Valley Crowns, and Border Plants, Azaleas, &c., at Stevens' Rooms.

THURSDAY, Oct. 12 { Plants, at Protheroe & Morris' Rooms.
Dutch Bulbs, at Protheroe & Morris' Rooms.

FRIDAY, Oct. 13 { Orchids, at Protheroe & Morris' Rooms.
Bulbs, at Protheroe & Morris' Rooms.

SATURDAY, Oct. 14 { Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—51° 9.

The Florist's Cannas.

THE Cannas are coming so rapidly into favour, and the number of named varieties is becoming so large, that some sort of classification becomes necessary.

The botanical history of the genus has already been treated of by Mr. BAKER in our columns, January 14, 1893, and following numbers, and elsewhere. For garden varieties we are largely indebted to French nurserymen, such as MM. CROZY, LEMOINE, VILMORIN, and others. Some of our own nurserymen, as Messrs. PAUL & SON, CANNELL, with others, are busily at work in raising new varieties, whilst our American cousins are equally eager on their side of the Atlantic.

The ordinary Canna-flower is erect or pendulous, and has a calyx of three outer segments surmounting the ovary. This latter varies in shape in the different species, but is always studded with little green knobs; the corolla consists of three long, narrow petals curled in at the margin. Within the corolla are the stamens, typically six in number, but united together, or split into two, or deficient in some cases, but when present, all are more like petals than stamens. Indeed, with all that display of floral bunting, there is only half an anther visible, and that springs from the side of a petaloid filament. Hence, LINNÆUS included these plants in his class Monandria. Had he said Hemiandria, he would have been nearer the mark. The style is a rather thick, flat, broad ribbon-like structure, bearing a line of stig-

matic tissue along its upper edge. From what has been said, it will be seen that the flower is already double by Nature, in the sense that the greater part of its stamens are represented by petals. It seems, therefore, doubtful whether the florist will be able to attain his ideal of a double flower any nearer than at present. It might possibly be effected perhaps by an increase in the number of the petals. Moreover, we can hardly imagine the florist resting from his labours till he has given a circular outline to the flower, and made it assume the form and appearance of some flower other than a Canna. Whether this is good taste or not is a matter of opinion. We think the florist should no more make a flower pretend to be something that it is not, than an author should wilfully misquote another, or attribute to his neighbour something that he has not said.

So far as the cultivated forms of Canna go, we must, in any attempt to throw them into groups, consider, not so much the botanical differences, as the purposes the plants are intended to fulfil in the garden. So considered, height is perhaps the first consideration. We must have (II.) tall varieties for the back rows of our borders and the centre of our beds, and shorter ones (I.) for the foregrounds and for pot culture. Indeed, the dwarf varieties, in which we should include forms not exceeding 20 inches in height, are now the chief favourites, and the taller ones, though useful enough in their way, are falling into disfavour. Next after stature, we should be inclined to place the colour of the foliage, for the leaves of Cannas, even apart from the flowers, are very effective. This would give us two secondary groups—purple-leaved forms (B) and green-leaved forms (A).

Coming now to the flowers, we have the distinction that some, such as *C. Ehemanni*, are pendulous, whilst others are erect. But the true Canna of the florists, as distinct from the pure-bred species, have erect flowers, or flowers which, as *Gladiolus* lovers say, look one in the face, as a bold-faced florist's flower should do; and it is desirable that the flowers should open on all sides of the spike instead of on one only, as in the older forms. But it is to the distribution of the colour that the florist will principally look, and from this point of view he will recognise 1. Selfs, such as (fig. 68, D) *Jacquemet-Bonnefond* or *Jules Chrétien*; 2. Bicolor forms, where one petal, the lip, is of a different colour from the rest, as in *Antoine Chantin*, where the segments are rosy-salmon coloured, while the lip is yellow, spotted and blotched with red; 3. Spotted varieties, as *L. E. Bailey* (fig. 67, A), *Progression*, and *Louise Chrétien*; 4. Blotched forms, as *Madame de l'Aigle* (fig. 68, C), the blotch being sometimes at or near the base, as in *H. L. de Vilmorin*, or near the top; 5. Margined forms, such as *Madame Crozy* (fig. 67, B). The ground colour may be yellow, which may be taken as typical, or of various shades of crimson-red or reddish-brown, and the spotting varies within the same lines. Hitherto we have not seen a white Canna, but that is by no means an improbable gain in the future. A blue Canna we do not expect to see, though *Strelitzias*, which are not very far off, have much blue in their composition.

After the colour may be considered the size of the flower and the breadth of its component segments, (a) narrow as in *François Corbin*, (b) broad as in *Prof. Chargueraud*, and then—and then—we shall have distinctions without a difference, and Cannas which, after the pattern of many *Roses* and *Chrysanthemums*, must come under the head of "too much alike." For temporary

purposes, or until a better and more complete scheme can be evolved, we offer the following scheme of arrangement:—

1. Dwarf varieties (including A n).
11. Tall varieties (including A B).
 - A. Foliage green (including I—4).
 - B. Foliage purple (I—4).
 1. Self-coloured varieties, arranged according to colour and form (including a b).
 2. Bicolor forms, where the lip is of a different colour from the other segments, as in *Antoine Chantin* (a b).
 3. Spotted varieties, arranged according to the ground colour and that of the spots (a b).
 4. Blotched varieties, according to colour (a b).
 5. Margined varieties, according to colour.
 - a. Inner flower-segments narrow.
 - b. Inner flower-segments broad.

We may add that we are indebted to Messrs. PAUL & SON of Cheshunt, and to Messrs. CANNELL & SON of Swanley, both of whom make a specialty of these flowers, for the opportunity of seeing the plants in growth, and for the means of comparing a large number of varieties, and thus of giving us the opportunity of proposing the above classification of the garden forms. It is, we trust, simple enough to enable anyone to group his plants, or frame his catalogues in accordance with it, and it is open to improvement and expansion as circumstances may necessitate. Certainly it is open to exceptions such as upset all such schemes, but that is inevitable.

THE KEW BULLETIN.—The September number is occupied with a catalogue of the flora of the island of St. Vincent, West Indies. A general account of the physical geography and climate of the island is prefixed. The total number of species of flowering plants collected in St. Vincent and the adjoining islets by Mr. HEABEAR SMITH and his assistant is about 1150. Comparatively few are endemic, or confined to the islands, but are diffused through the W. India islands. The predominating natural orders are Leguminosæ, which have no fewer than 141 species; Gramineæ come next with 58, Rubiaceæ 52, Compositæ 45, Orchidæ 43; of Ferns and Lycopods there are 163 species belonging to 35 genera, so that the Fern flora is rich and varied, but there are only four endemic species. Altogether the vegetation of St. Vincent is varied and luxuriant, bespeaking a fertile soil and a favourable climate. Mr. H. POWELL is the curator of the revived Botanic Garden.

THE ROYAL HORTICULTURAL SOCIETY.—The next meeting of this Society will take place in the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday, October 10, when prizes are offered for hardy herbaceous perennials. At 3 o'clock, Mr. W. CRUMP will deliver a lecture on "Pears."

ROYAL VISIT TO THE BRUSSELS BOTANIC GARDEN.—II. M. LEOPOLD II., the King of the Belgians, paid, on Saturday, September 23, a visit to the Botanic Garden. M. LOUIS LUBBERS, the Director, conducted the royal visitor through the various departments of the garden, and into the principal houses. The King expressed several times his satisfaction at the condition of everything, which, in fact, reflects great credit upon M. LUBBERS. The large Fern-house attracted special attention; there is in Europe no more interesting nor complete collection of these plants than this one at Brussels. The interest which His Majesty takes in horticulture is well known and appreciated; this visit cannot but tend to still further increase it.

MONTBRETIA CROCOSMIFLORA, FL.-PL. — According to an article of Mr. MARTINER's, in *Le Jardin*, this plant originated from the hybridisation of *Montbretia Pottii* and *crocsmia aerea*. The

FIG. 68.—(C), CANNA MADAME DE L'AIGLE: FLOWERS YELLOW, BLOTCHED AND SPOTTED WITH SCARLET.
 (D), ,, JACQUEMET BONNEFOND: DEEP CRIMSON SELF, AND WITH VERY LONG PETALS.
 (SEE P. 432.)

hybrid issue was crossed and recrossed in various ways, and thus have come into being the numerous forms now found in gardens. M. M. LEMOINE observed in one of the varieties known as "Pluie d'Or" (Golden Rain), a tendency to become double. This was carefully watched, selection made, which ultimately resulted in the double-flowered form now so much admired.

BLACK ANTIGUA PINE.—In a supplement to the *Leeward Islands Gazette*, Mr. BARBER expresses his opinion that the Black Antigua variety no longer exists. Mr. HART, of Trinidad, says it is the same as the Ripley Queen, and qualifies it as the best of all. Mr. BARBER thinks either that the once celebrated Pine has deteriorated by negligent culture, or that it has stood still while other varieties have improved, or, thirdly, that a more readily-growing variety may have taken its place. In any case, Mr. BARBER is not now able to recognise in Antigua the Pine which derives its name from the island.

THE RE-UNION OF BRITAIN AND AMERICA.—Mr. ANDREW CARNEGIE sends us a pamphlet on this subject. We cannot enter into the political or commercial reasons which might be cited for or against the proposal, but looking at the matter from a scientific and literary point of view, we have not, and do not, consider an American a foreigner. We claim a joint interest in ASA GRAY and OLIVER WENDELL HOLMES, for instance, and are startled when we hear them spoken of as foreigners.

A CHARMING WINDOW-BOX.—The hot, dry summer has brought into prominence the value of foliage plants in outside window-boxes, and where flowering plants were employed it has been found necessary to frequently change them, at much cost of money and labour. Foliage plants, on the other hand, when selected with care, properly planted, and attended to, have been found to answer very well. A noteworthy illustration of this is found in a box in the window of Mr. J. WILLS' house at Onslow Crescent, South Kensington, which it would be difficult to excel in all respects. The box is nearly 12 feet long, 18 inches wide, and nearly as deep; and it was planted the second week in May with *Dracæna Goldiana*, and various other rich-coloured varieties of *Dracænas*, some well-coloured *Crotons*, such as *Weismannii*, *Queen Victoria*, *D'Israeli*, &c.; *Nidularia fulgens*, richly coloured and enduring; *Arundinaria falcata*, *Pandanus Veitchii*, *Kentia Belmoreana*, *Phoenix reclinata*, and other Palms; *Asparagus plumosus*, *Aspidistra lurida variegata*, &c. The arrangement is perfect, and while the box is well filled there is an absence of crowding. From the time the box was planted there has been no need for change; and four months afterwards there is not a plant but appears to have improved. Falling down over the front of the box and covering it can be seen *Panicum variegatum* and *Tradescantia zebrina*. The walls of the house are draped with creepers, and this adds to the effectiveness of the box, which faces due east. Twice a day the contents of the box—morning and evening—were syringed, and water afforded the soil as was found necessary.

HYDRANGEAS.—Recently, as we learn from *Garden and Forest*, the Massachusetts Horticultural Society gave its gold medal to the Honourable JOSEPH S. FAY, of Wood's Holl, for the superior cultivation of specimen plants of *Hydrangea hortensis*. Five or six of the plants were exhibited in the Society's hall in Boston. The plants were faultless, the largest being about 10 feet through and 7 feet high, and bearing some 300 well-developed heads of flowers; the others were only slightly smaller, and all were mounds of large, healthy and well-coloured foliage almost hidden by the flower-heads.

ROOT FUNGI.—We are so accustomed to think of fungi as noxious parasites, that the recently-published statements that, so far from being always noxious they are sometimes beneficial, has been received with some amount of scepticism. The matter has been put to the test by M. E. FRANCK, an abstract of whose paper we find in a recent number

of the *Annales Agronomiques*. Mr. FRANCK took soil from a forest, sterilised one portion of it so as to obviate the growth of fungi, and allowed the other portion to remain as it was. Seeds of Pines were sown in both portions, with the result that in the second, and third year especially, the plants growing in the non-sterilised soil were found much more robust than those grown in the sterilised soil. No fungus was found in the latter, but abundance in the former.

THE ACTION OF THE HUMIDITY OF THE SOIL.—New light has been thrown on the subject by M. A. OGER, who has experimented with *Lapsana communis*, *Sonchus asper*, *Mercurialis annua*, *Chenopodium album*, *Balsamina hortensis*, &c. He states (see *Comptes Rendus*, cxv., p. 525) that if plants of the same species are grown, some in a very dry, others in a very moist, soil, other conditions being equal, that those which are growing in moist soil will assume all the characteristics of plants which grow naturally in moist situations. Thus, they become of a large branching habit, their upper leaves become very long, the inflorescence lax, whilst in structure the vascular bundles increase in number.

THE BUD MOTH (TMETOCERA OCELLANA).—Mr. MARK VERNON, Slingerland, gives, in the *Bulletin* of the Cornell University Agricultural Experiment Station, a description of this insect, which attacks Apple trees. The caterpillars eat into the bud in spring and thus check the new growth, and tie the central leaves and flowers together by silken threads, the leaves becoming brown as if burnt by fire. It is not practicable to check the pest in the adult or in the egg stage, but it can be checked in July when the larvæ are feeding on the leaves, or in early spring by spraying the buds with Paris Green, 1 lb. to 300 gallons of water.

BORON, LITHIUM, AND COPPER IN PLANTS.—These three substances, between which no apparent relation has yet been recognised by chemists, have recently been discovered to be associated together in the stems of Tomato plants, of Chick Peas (*Cicer arietinum*), and of Iris germanica. The tissues of plants are made up of a very heterogeneous collection of substances, but hitherto the presence of these three has not yet been recognised. PASSERINI, whose researches upon the composition of plants are frequently reported in the *Staz. Sp. Agrar.*, has recently been bringing that delicate instrument, the spectroscope, to bear upon his investigations, and by means of it the presence of copper, lithium, and boron was determined (*vide St. Sp. Ag.*, xxi., pp. 20, 471, and 565).

COSTA RICA.—The great number of catalogues we receive prevents our doing more in an ordinary way than acknowledge their receipt, but exceptional cases occur in which we may, without breach of impartiality, call attention to particular lists. One such is before us—that of Mr. RICHARD PFAU, of San José, Costa Rica, which is remarkable as showing what European plants may be grown in the Central American Republic, and what native plants may be derived from that source. The catalogue is in Spanish.

GRAFTING.—Mr. J. T. WRIGHT publishes in the *Botanical Gazette* for August, an account of his researches on the mode of union of cells in herbaceous grafting. This he finds takes place in two ways, either by the compression of the cells of the scion and those of the stock, by which the two cells become welded together, or by the formation of meristem tissue (callus) on the cut surfaces of one or of both plants. The broken walls of the injured cells are pushed into line by the growing tissue, and form a brown layer which everyone recognises on examining grafts by the microscope. The paper is of special interest, as showing the causes of failure or of success, and why graft hybridisation may probably occur in some cases, whilst the arrangement of the tissues would probably prevent it in others. In his experiments, Mr. WRIGHT succeeded in obtaining union between such unlikely subjects as

Tradescantia zebrina on Potato, and Geranium on Potato. He does not tell us, however, how long the graft survived.

ACORN POISONING.—The attention of the Board of Agriculture has been called to the unusual abundance of the crop of acorns this season, and it is considered desirable to warn stockowners who are accustomed to turn cattle into parks, on to commons, or other places where acorns are plentiful, that there is considerable risk of injurious effects arising from the consumption of large quantities of acorns, which in the present dearth of herbage, owing to the long drought, are certain to be eaten with avidity. In the years 1868, 1870, and 1881, which were remarkable for a large yield of acorns after a long dry and hot summer, serious losses among young cattle occurred from outbreaks of what is known as the acorn disease, or acorn poisoning. Young cattle up to two years old suffered most severely. Milch cows and cattle over three years old were seldom affected. Sheep and pigs appeared to be unsusceptible to the poisonous action of the seeds, and only two or three cases of the disease were reported in these animals, while entire herds of young cattle were attacked, and a large proportion of them succumbed. Acorn poisoning is quite distinct from indigestion due to eating an excessive quantity of acorns. This accidental disorder may occur in ordinary seasons when animals are first allowed access to pasture where acorns abound. But the true acorn disease is distinguished by progressive wasting, entire loss of appetite, diarrhoea, discharge of an excessive quantity of pale urine, sore places inside the mouth, discharge from the nostrils and also from the eyes, which are always sunken, giving to the animal a peculiar haggard expression. No fever is present from first to last, but, on the contrary, the temperature is commonly below the normal standard. On post-mortem examination it is frequently noticed that all traces of the acorns have disappeared. The morbid changes are such as are seen when an irritant poison has been given. Remedies of various kinds were tried in the great outbreaks of the disease, but no cure was discovered. Prevention is comparatively easy when the risk is realised. It is only necessary for absolute security to keep cattle from the pastures while acorns are falling. The danger will be materially lessened by collecting the acorns from the pastures, but this device does not prevent a considerable consumption of the nuts which fall during the night. It has also been suggested that when cattle are only allowed access to acorns during the daytime they should be supplied with a liberal allowance of food before they are turned out. It cannot be affirmed that these plans have always proved successful in practice.

ORCHIDS AT "L'HORTICULTURE INTERNATIONALE" (LINDEN).—We found here lately in bloom a remarkable *Laelia elegans* with a handsome lip, the general effect very beautiful; a curious species of *Catasetum*, the sepals forming a semi-circle of tender green surrounding the yellowish-green flower, the interior of the flower transparent yellow; *Cattleya maxima peruviana*; *C. Eldorado*, a fine flower with very broad petals of the shade of *C. Schroderae*, that is a tender and rare tone of rose; *C. Alexandrae* well-bloomed—when this Orchid is well cultivated it will be acknowledged to be a valuable acquisition; some fine *C. Warocqueana*; *Cypripedium Hookeri* × *Veitchii striatum*; many fine varieties of the charming *Cattleya Alexandrae Salmonei*; *Anthurium Van Wambekianum* showed splendid blooms of beautifully pure white. *Ch. D. B.*

WEMBLEY PARK AND TOWER.—On the 28th ult. a large number of gentlemen, including representatives of the daily and weekly press, visited the new park on the invitation of Mr. H. E. MILNER. The park and grounds comprise some 160 acres, with a considerable margin for building purposes; it is well wooded, and there are many trees of mature growth. All the newly-planted trees and shrubs have done remarkably well; indeed, the admirable appearance of greenness on every hand was

remarkable. The main road is carried round the grounds to the tower, and the intervening spaces have been set apart for sports and other purposes, including a cricket-ground, which promises to be a very fine and picturesque one. In addition, there is a spacious lake of 8 acres, fed by the river Brent, and the beauty of the scene has been enhanced by the erection of pretty bridges, and the introduction of a waterfall. The fullest advantage has been taken of the natural beauty of the landscape, and much praise is due to Mr. MILNER for his treatment of it. There is a wood on the north side of the park, which it is intended to illuminate by night; and a building that was formerly the residence of the owner of the estate will be converted into a club-house, on the lines of the Welcome Club at Earl's Court. The Tower occupies the most elevated portion of the grounds, and its starting-point will be 165 feet above the level of the sea. The supports are already in position, and if all goes well it will be completed in eighteen months, and the top will reach 1300 feet above the sea-level. To lend additional interest to the proceedings, on the 28th ult. a cricket match took place between two elevens selected from Earl's Court and Wembley and the Metropolitan Railway Clubs, in which the former proved victorious. In the evening a dinner took place in the pavilion, Mr. H. E. MILNER presiding. It may be mentioned that the Wembley Park Station, which lies midway between Neaden and Harrow, is close to the entrance to the park.

ISLE OF THANET CHRYSANTHEMUM SOCIETY, MARGATE.—Mr. EDWIN LEVETT, Hon. Secretary, informs us that the seventh annual show will take place on November 8 and 9, at the Hall-by-the-Sea, Margate.

A PROLIFIC PEAR TREE.—As an instance of the fertility of Pear trees this season, we quote the following from the *Standard* of September 20:—"I have lying before me specimens from a Pear tree planted by a well-known resident of Southampton, Mr. HENRY, Port Aslett. This tree has bloomed and fruited four times this season, and to-night I have received Pears of the last three growths, luscious and well-developed fruit, and gathered in first-rate condition." [] *John Smith, Lansdowne House, South Lambeth, September 18.*

TIMBER OF THE AMAZON DISTRICT.—We have before us a catalogue of the woods exhibited by the State of Amazon in the Chicago Exhibition. It is not wonderful that there should be 441 entries, even if we suppose that the same thing is sometimes exhibited under two or more names; but it is by no means creditable that out of the 400 an extremely small proportion have names by which they can be recognised.

F. L. AMES.—As mentioned in our last issue, this gentleman (a well-known and very highly respected citizen of Boston) died on September 13. It appears that he was on board a river steamer on his way to New York on business, and was found dead in his state cabin on the morning of the 13th ult. Mr. AMES was largely interested in railways and other financial enterprises, and had accumulated a large fortune. He was an ardent Horticulturist and a Vice-President of the Massachusetts Horticultural Society. His estate at North Easton was one of the most beautiful in New England, and is remarkable for a fine collection of Orchids, a circumstance which brought him into communication with Orchid growers in this country. Pictures and works of art were also among his hobbies, and large sums were dispensed for charitable purposes. Mr. AMES was in his fifty-ninth year.

RAHAT LOUKOUM.—A curious manufacture is referred to in the British Consul's Report to the Foreign Office, on the trade and commerce of the Cyclades for the year 1892—namely, that of the confection known as "Rahat Loukoum," or Turkish delight, which, or an imitation of it, has become so popular of late years in this country. This manufacture at Lyra, which was formerly a very flourishing trade, has recently decreased considerably, owing, it is said, to the high prices charged, and the dearth of the materials employed. About twelve

factories were actually at work during the year, employing an aggregate of 120 men. The kind which is flavoured with essences of Pistachio, chocolate, Citron, Banana, and the like, is by far superior to that made at Constantinople or elsewhere in the Levant, and curiously enough, its excellence is attributed to the water of the island. About 500,000 are annually produced, representing the estimated value of £40,000. The greater portion of this produce is consumed throughout Greece, and very little is exported. About 300,000 casks of comfits are also annually manufactured at the same establishments, valued at £36,000.

FLOWERS FROM NEWRY.—From Mr. SMITH, of the Daisy Hill Nurseries, we have received a representative collection of flowers of special brilliancy in point of colour, and some of unusual interest. We take them in the order in which they come to hand:—

Clematis graveolens.—A species with twice or thrice ternated leaves, the lobes stalked, broad; the flowers solitary, on long slender stalks, 4 cm. long, recurved at the end. Flowers nodding, about 14 cm. diameter, pale yellow. The seeds were originally collected in 1844 by Captain (afterwards General) MUNRO in Chinese Tartary, at an elevation of 12,000 feet. The seeds were received at Chiswick in May, 1845, and the plants were in bloom in July, 1846, when they were figured and described by LINDLEY in the *Journal of the Horticultural Society*, i., p. 307.

Lobelia Kernerii.—Stem angular, slightly hairy. Leaves with very prominent glands at the margin. Flowers rich crimson, 1½ inch (4 cent.). Calyx lobes linear; petals narrow. Probably a form of *L. fulgens*.

L. cardinalis.—Stem angular, nearly glabrous. Leaves lanceolate, with glands at the margin; flowers scarlet, 1½ inch (33 mill.) long. Calyx lobes linear; petals all narrow.

L. Milleri.—Stem angular, glabrous. Leaves lanceolate, remotely denticulate, minutely glandular; flowers rich violet-purple, 1½ inch (33 mill.). Pedicels very short. Calyx lobes lanceolate, lower lobes of the corolla broader than the upper two, ovate, lanceolate. Probably a form of *L. fulgens*.

L. ignea, Firefly.—Stems reddish-purple, cylindrical, glabrous. Leaves lanceolate, acuminate-glandular, toothed. Flowers nearly 2 inches (5 cent.) long. Calyx lobes linear lanceolate. Corolla deep crimson-scarlet, two upper petals narrow, three lower ones obovate oblanceolate. Probably a form of *L. fulgens*.

Lobelia Magenta Queen.—Stem purple, angular furrowed; leaves purple lanceolate acuminate, slightly glandular at the margins. Flowers rather more than 1 inch (3 cent.). Calyx lobes lanceolate acuminate; corolla crimson, three lower lobes oblong acute.

Lobelia Tupa.—Robust habit, surface downy; stem angular; leaves large, subcoriaceous, obovate oblong acute, margins glandular, markedly concrescent at the base, with the stem upper leaves 4 inches long (10 cent.) by 1½ inch (40 mill.), pedicels 1 inch (25 mill.), exceeding the lanceolate bracts. Flower 1½ inch (45 mill.); ovary pear-shaped, calyx lobes short, deltoid acute, hirsute purple; corolla deep crimson, downy; petals linear, equal, cohering at the tips, and all deflexed. A native of Chile, very distinct in appearance, and very handsome.

Liatris callilepis.—A very beautiful hardy perennial. Stem angular, thinly beset with white hairs. Leaves sessile, glabrous, linear-lanceolate, midrib prominent on both surfaces. Head of flowers solitary, terminal, about 4 cent. across (1½ inch). Bracts numerous, leafy, linear-oblong, loosely arranged, and gradually passing into involucreal scales. Flowers brilliant lilac. Ovary hairy, surmounted by a plumose pappus. Corolla-tube slender, dividing above into five equal linear segments. Anthers brown, pointed at the base, and with a whitish process at the tip. Style protruding beyond the corolla-tube, dividing into two long, curved, channelled, stigmatic lobes. We do not find the name in the American Floras, nor in NICHOLSON'S *Dictionary*.

Parnassia caroliniana, differing from our European form in the greater length of the flower-

scapes, the many-veined petals, and the 2 to 3 branched staminodes. Though named *caroliniana*, it has a wide distribution from New Brunswick to Florida.

Sericocarpus solidagincus?—A shrubby-looking, Aster-like plant, with numerous erect, stiff angular branches, covered with coarse appressed hairs. Leaves linear-lanceolate, remotely toothed, 6 inches long (15 cent.), ½ inch (12–13 mill.) wide, many-nerved. Flowers numerous, in much-branched, erect flower-heads. Each flower-head about ½ inch (12 mill.) broad, surrounded by a many-leaved involucre of linear leafy bracts. Ray-florets narrow, white, exceeding the bracts. Pappus slightly plumose. The plant does not agree in generic characters with *Sericocarpus*.

Cytisus elongatus.—Shrubby, with very long slender branches. Leaves trifoliolate, leaflets small, oblong, mucronate, silky on the under surface. Racemes terminal, very long, many-flowered. Flowers yellow.

PLANT PORTRAITS.

AZALEA RUSTICA FL. PL., *Revue de l'Horticulture Belge*, October. Under this name are described some forms of *A. mollis* with double flowers. The introduction of the Latin quasi-specific name *rustica* is a misfortune.

CARPINUS CARPINUS (sic), *Garden and Forest*, August 30, better known as *C. japonica*.

DENDROBIUM AINSWORTHII ×, *Neubert's Deutsches Garten-Magazin*, n. 10.

DRACENA LINEATA, *Revue de l'Horticulture Belge*, October.

FRANCISCEA CALYCINA, *Revue de l'Horticulture Belge*, October 1.

KALANCHOE GRANDIFLORA.—An Abyssinian *Crasulad*, introduced by Schweinfurth. It has shortly stalked orbicular crenate leaves, and erect heads of white or flesh-coloured flowers, each with a long slender cylindrical tube, and a four-parted limb, of which the segments are lanceolate.

LELIA ANCEPS SANDERIANA, *Garden*, September 23.

LELIA ANCEPS SCHRODERIANA, *Garden*, September 23.

NURSERY NOTES.

THE PENRITH NURSERIES.

To passengers on their way to Scotland or to the English lakes, the ruins of Penrith Castle, close to the railway station, are conspicuous, and the fact that the Castle hill and moat have been made into a well-kept nursery, will have been noticed by many. Messrs. Herd Brothers have also a large piece of ground on the south side of the town, and recently they have acquired a portion of the Beacon Hill, which forms such a conspicuous feature on the west side of the old town. The cold climate of this locality is not inviting for the expenditure of high cultivation, as found in nursery work; but plants which succeed here are not only suitable for the locality, but will be eminently adapted for planting in more favoured localities.

The Penrith sandstone is quite unique, being wholly composed of quartz grains without a trace of mica or other mineral, and gives rise by its disintegration to a free-working, gritty, and poor soil, which, however, is improved in places by presence of glacial drift. The proximity of the Cumbrian mountains insures a heavy rainfall, which is carried off rapidly by the river Eden. Messrs. Herd's nurseries are essentially devoted to hardy plants, about twenty greenhouses sufficing for the demand for tender plants.

Forest and fruit trees receive a large amount of attention. On the Beacon Hill, at an elevation of 900 feet, there is a fine breadth of *Pseudotsuga Douglasii*; and a nice lot of Scotch Fir, Larch, Spruce, Sycamore, &c., are also grown. Gooseberries seem

well suited here; seldom have we seen such sturdy and healthy plants, particularly Whinham's Industry, Crown Bob, and Lancashire Lad. Of these, large quantities are distributed over the British Isles, America, and the Continent. Gooseberries are not easily propagated in North America; the cuttings do not strike—hence the perennial demand. Only the hardiest varieties of Apples, Pears, and Plums are grown. Standard Roses do not succeed well here, but we noticed some quarters of particularly healthy dwarf Roses. The ornamental trees are chiefly grown in the old Castle gardens, which form a conspicuous feature from the railway station.

Amongst florists' flowers, Pansies and Carnations are a specialty. Among the latter are several new kinds, the most conspicuous being Mrs. Hamlet Riley, a pale flesh flower, of extra good form; Duchess of Fife, pure deep pink—does not split; Mrs. Muir, *Gardenia*-like in shape and colour; Maggie Roy, a pale pink-fringed flower; Stadrath Bail, a choice yellow ground; Keir Prince, the new scarlet; and many other new and rare kinds. Messrs. Herd are also working a nice collection of alpine and herbaceous plants, this class being popular in the North for cutting and exhibition purposes. *F. V. D.*

BEGONIAS AT BEXLEY HEATH.

The season that is now closing has, on the whole, been one quite unfavourable to the Begonia in beds outside. A moisture-loving plant, delighting in an atmosphere with a certain amount of humidity, the incessant watering, which has been a necessity from the time when the tubers were planted out, can never supply the conditions which are furnished by a warm moist summer weather. The principal reason is that, however much the watering-pot may be used, it does not create the humidity in the atmosphere that follows general rain, although it may succeed in keeping the top of the soil moist. Until this season, it is several years since the Begonia has been so handicapped, and during the last four or five it has shown off with advantage to itself when compared with the Pelargonium. This year, however, the Pelargonium has found conditions peculiarly adapted to its requirements, and in the many parks and gardens we have visited, it has thoroughly beaten the Begonia in the display of blooms all through the season, and fresh and convincing evidence has been given that the Begonia is the better plant for our usual summers, and especially a wet one; but on the other hand, it is very ill adapted for such dry and hot weather as we have experienced since spring.

Good cultivation greatly minimises the injury they receive from such adverse conditions, however; and in looking over the beds of seedlings belonging to Mr. Thos. S. Ware, at Crook Lodge Nursery, Bexley Heath, it may be seen that untiring attention and constant use of the water-pot has been given to them. The plants were very well covered with bloom when we saw them some few days since, the only noticeable results of the season being the very little growth the plants have made, and the gaps in the beds owing to many of the little tubers having been dried or scorched up before they could establish themselves. It is satisfactory to find that in many cases where the plant has made but little growth, the tuber has swelled to a considerable size, and out of proportion to the top.

The strain here is rapidly becoming one of the best, splendid blooms of single and double varieties being noticeable among the seedlings in the beds. The flowers are large, and have much substance, whilst the colours are very clear and distinct. There are many thousands to be seen in the beds, over 200,000 were put out in the spring, and the singles are kept true to colour. It is remarkable how true these come from seed, there are very few rogues to be seen even in the large beds. In some beds in front of Mr. Pope's house, we noticed a variety called Maria Lentz, a capital white sort for forming an edging to other kinds; exceedingly floriferous, its drooping character makes it very useful for such a purpose. Beauty of Belgrove in another bed looked first-rate, but it requires staking, and this

is a disadvantage. The Marquis of Stafford, with much smaller blooms of a good crimson colour, requires but little staking, and is a pretty and effective sort.

Looking through the houses we found many of the best varieties still in bloom, but as they are now allowed to carry their seeds, the plants and flowers were not up to their true character. Queen Victoria, a double Camellia-like bloom of pink, looked very pretty; and Champion, another of last year's seedlings, is very fine. This is a single golden-bronze variety, very large, and of good habit, with thick strong stems. *Violacea*, another single—in colour scarlet, with shade of violet; and *Alba marginata fimbriata*, are both last year's productions. The latter is a single white flower, with rose margins, somewhat fimbriated, has straggling stems, and is very pretty. Duke of Teck, Duchess of Teck, Princess May, Henshaw Russell, Triomphe de Nancy, Leviathan, Sunset, Pride of Bexley, &c., were all in bloom, but betrayed evident signs that the Begonia season for 1893 is practically over.

BEGONIAS AT FOREST HILL.

On the occasion of a recent visit to the Stanstead Park Nursery of Messrs. Laing & Sons, it occasioned us some surprise to find a remarkably fine bloom on the single and double-flowered varieties in the open air. There must be an area of something more than 2½ acres under the Begonia crop, four-fifths of which are double-flowered varieties, and mostly at present under number. Selection was busily going forward amongst the latter; and plants of markedly good character, or which exhibit novel colouring and erect flower-stalks, good single centres, like a Rose or Camellia, marbled foliage, and other desirable features, were being dug up, with as much earth about the roots to enable the workman to properly pot them in 32-sized pots. These plants are placed in some of the many houses, and encouraged to bloom until the dark days of November render further flowering impossible, when they are put to rest for the winter. From these carefully-selected plants, whose progenitors are duly noted by name in the pedigree-book of the nursery, are selected those charming plants that delight visitors at horticultural shows all over the country, and furnish a large portion of the display of our greenhouses, and in lesser degree the flower-beds, once sacred to the Pelargonium.

Some few shades of colour were noted in the doubles; and good white flowers were seen. Of new colours mention should be made of a variety of shades of salmon-pink, shaded with orange; habit very erect. Several have a ground colour of some yellow tint, and a margin of rose-pink; some most desirable tints of creamy-whites appeared in the doubles; and a buff flower, tinted with scarlet, would be sure to find admirers. Apricot-yellow is a colour that seems to be much valued, and it is one that has been deliberately worked for in the various crosses. In the more common colours, Henshaw Russell struck us as being an extra-good double-flowered scarlet, a plant of which has been in bloom since last April, and even now is enjoying an old maid's summer of bloom. Duchess of Teck is a desirable flower, of a light yellow colour. A novelty was noticed in a decidedly-fringed white variety, that is likely to be put to good use in crossing.

Besides the usual division of varieties into single and double-flowered, there is still another—that of pendulous ones, a class that furnishes admirable plants for vases and baskets. Amongst the houses still full of plants in full bloom, is one containing plants that were pricked out in May last, and are therefore of the same age as those in the beds. These show fine quality generally, and are of an average height of 1½ foot.

The season was very adverse to the well-being of the Begonias in the beds, for with the best efforts and the application of mulching it was impossible to maintain the soil in as moist a condition as would favour growth; hence the plants remained small until September came. Since the rains which came in that month they have, we were told, doubled in size, and greatly increased in floriferousness. If

there be a difference between singles and doubles in the power to withstand drought, it is the former that have it.

Provided the frosts are not of sufficient severity to destroy the blooms, the display outside may last for several weeks longer.

A peep into the orchid-houses sufficed to show remarkable improvement in the look of the plants in the last twelvemonths; good healthy growth characterising all of them.

In bloom were several *Cypripediums*, *Laelia Dayana*, *Vanda tricolor*, *Phalenopsis amabilis*, *Dendrobium Schroderianum*, and one *Cattleya labiata Warocqueana*.

ARAUJA SERICIFERA.

I SEND to you by to-day's post a specimen of the magnificent fruit of *Physianthus albens* [now called *Arauja sericifera*], grown out-of-doors in my garden here. Although I have had six or more plants out-of-doors for several years, this is the first year that my

work of a Herefordshire man, we find excellent lists of cider Apples and perry Pears suitable for planting and regrafting standard orchard trees. That portion of the manual which is devoted to fruit culture for small holdings, reiterates much of what has been propounded by other writers on the same subject; but we think, with generally fuller instructions with regard to draining, distance to plant the various trees, bushes, and pyramids. Except where trees of an ornamental character are desired, we would rather see pyramids omitted, especially in cottage gardens, owing in part to their being less fruitful than bushes, and less long-lived than these or standards, and requiring a good deal of time to be spent on them when it can least be afforded in pinching and stopping shoots. The Damson, the poor man's friend, is recommended to be planted in all cottage gardens, and on every fruit farm; the prices obtained being very remunerative, and the fruit can be kept much longer both on the trees and after gathering it, than is the case with soft Plums. The fruit is often said to realise from 10s., 15s., and 20s., per pot (5 pecks). Some

FIG. 69.—FRUITS OF *ARAUJA (PHYSIANTHUS) SERICIFERA*. Reduced one-half.

plants have borne any fruit. They have flowered regularly year after year, and now, while each plant is covered with hundreds of flowers at the same time, there is a show of fruit of the size of the specimens sent herewith. The specimen I have sent is the only branch that has large double fruit on it. It is very remarkable. The plants I have are on poles about 6 or 7 feet high. The fruits are mostly on the lower parts of the creeper; but fruit of various sizes, some apparently only beginning to form, but the whole plants are covered with flowers, which close upon and hold fast any insect that touches them. *John Rashleigh, Menabilly, Cornwall*. [We give an illustration (fig. 69) we published some years since. The fruits are shown reduced one-half. Ed.]

BOOK NOTICE.

THE ORCHARDS: FRUIT CULTURE FOR SMALL HOLDINGS. By J. Cranston. (Messrs. Jakesman & Carver, Hereford.)

Another work by an expert, seemingly called for by the present increase in the cultivation of hardy fruits. The methods advocated are, as might be imagined, just those we should expect to find, coming, as they do, from so well experienced a cultivator as Mr. John Cranston, and they do not differ in essentials from those advocated by many other writers of note on the same subject. As befits

good recipes for ridding fruit trees and bushes from insects are given, including those in which arsenic in some form is largely used; and together with these are given cautions with regard to the use of these substances.

Select lists of varieties of Apples, Pears, Plums, Damsons, Cherries, Currants, Gooseberries, Strawberries, and Nuts, complete this very useful handbook.

HAVERING PARK, ROMFORD.

ROMFORD contains some good private gardens, one of the best amongst which is the beautifully-situated residence of Mrs. McIntosh at Havering Park. The place, too, possesses historical interest, for as records tell us in the time of Edward the Confessor, 1042 to 1066, the Liberty of Havering-atte-Bower came prominently into notice. This monarch spent a great part of his time at Havering, which was his favourite resort, where he either built a new palace or renovated the old one of his predecessor.

Here he often lived, and here it is said he died. This palace, which was for ages closely associated with our ancient royalty, was delightfully situated in an extensively and charmingly-wooded undulating park. The residence commanded a view, more or less, of five counties, Middlesex, Surrey, Kent, Herts, and Essex, and also of the River Thames. This royal park, doubtless, from some specially favourite retreat of delightful shade which it contained, was distinguished

by the name of Bower, reminding us of Rosamond's famous bower at Woodstock, and hence from time immemorial the village with its ancient Elm which was growing four centuries ago, and is still standing on the village green (?) that was in days of yore a part of the royal gardens, has been known as Havering-atte-Bower.

The extent of Havering Park of to-day is about 1500 acres, and Pines, Oaks, Elms, and Hollies are the trees which do best here, particularly Pines and Hollies; an avenue of *Sequoia gigantea* about half a mile in length, is an especial feature of the place.

There is a nice range of glass, and here Peaches were noted as doing particularly well, some 120

HOME CORRESPONDENCE.

LILIES.—We send you a box of cut Lily blooms, taken mostly from plants growing out-of-doors, *L. speciosum* Kratzeri, *L. s. Melpomene*, *L. s. macranthum*, and *L. tigrinum* Fortunei. Owing to the persistent drought, Lilies out-of-doors in the open have this year had a bad time of it. The flower-spikes are short, and the blooms are poor in substance; but as regards pot-culture, where moisture has been freely given, it is quite different, and the spikes and blooms are good. *Lilium nilghirricum* has flowered very freely with us, and very early, but requires to be both started and finished under glass. Our imported bulbs reached us late in the spring in

translucent like deep sea-water; and secondly, the numerous large processes of a rich orange-yellow, which fringe these green axes, and occupy the centre of flower. It is a beautiful flower for ladies' wear, especially for those of a dark complexion; on in a decorative point of view, for a room, a couple of blooms well hacked by foliage of dark green, such as that of the cut-leaved scented Geraniums, are very effective. We feel convinced that this Lily will become a great favourite with the fair sex. We have also enclosed a small spike of *Gladiolus Lemoinei* Sophia Buchner grown from "spawn" planted last November. *Gladioli*, too, owing to the drought, have done badly, and the spike would have been twice the size in ordinary weather. It is a new and good form, and a good doer. *Wallace & Co.*

STRAWBERRIES IN OCTOBER.—There appear to be no limits to the peculiarities of this extraordinary season, and it may interest your readers to hear that on October 1, I picked a handful of perfectly ripe Strawberries in my father's garden at Sonning, near Reading, Berkshire. I may add that the plants are not protected by glass, and are not sheltered by the walls of the garden. We only require a few days warm sun to enable us to have Strawberries on the table in the second week in October. Is it likely that this second crop will have any effect upon next year's fruit? *Henry T. C. Knox.* [Yes, unfavourable. Ed.]

RETAINING WALLS FOR PEACHES AND NECTARINES.—Good Peaches and Nectarines can be grown in the open, I am sure, without the expensive retaining walls of brick, as recommended by Mr. Turton in his calendarial remarks on p. 367. If the climate is not suitable for successful culture, the use of brick walls to confine the roots will not be of any service. If the border is 4 feet or 6 feet wide, the roots can easily be kept within this space by digging out a trench every second or third year at the front of the border as deep as the roots go. These periodical root-prunings are of great advantage in Peach and Nectarine growing out-of-doors, inducing fibrous roots to form much better than retaining walls would do. If the border is wider than 6 feet, and vegetables or flowers are grown on it, the necessary trenching and digging will answer the purpose of checking the extension of the Peach tree roots. *S.*

DO LARGE ONIONS KEEP WELL?—I for one contend that large Onions keep well when properly harvested and stored in a suitable place. Last season our bulbs of Ailsa Craig Onion, many of which weighed 1½ lb., kept in a plump state longer than any other variety, not excepting Brown Globe, which is looked upon as one of the best keepers. They were suspended, singly, from the rafters of a cool shed where frost does not penetrate. *E. M.*

THE WEATHER IN NORTH DEVON.—The favoured climate of Devon and Cornwall is a matter frequently mentioned in your columns, but it is not so highly favoured at all seasons as is represented; for instance, on the night of the 21st ult. we had thunder with tremendous hail-storms, which cut up vegetation sadly, and spoiled a great number of plants in pots. On some farms the green crops have very severely suffered; but it appears that the area of the storm did not extend very far. *North Devon.*

CODDLING IN GARDENING.—Is it a fact that any of the Onion tribe need to be stored in frost-proof places? My experience leads me to contend that such care of them is totally needless. My father, a most observant man, and first-class gardener for a quarter of a century in a north country garden, had to store his Onions and Shallots in a room that had a slate roof, walls 1 foot thick, and single board doors, no ceiling, and hit-and-miss shutters. In this room the bulbs froze as hard as a stone in some hard winters under a 6-inch covering of hay, but they were not spoiled by that, and he had Onions as late in the season as anyone. The room had a board floor, and stood above the Potato cellar, so that it was perfectly dry. We coddle our things too much nowadays. For instance, in those days shrubby *Calceolarias* were a good deal used in bedding, much more so than now; and the cuttings of these, in some cases forgotten varieties, were put in October into pots of sandy soil, 20 to 24, in a 48-pot, the soil being surfaced with white sand. These pots were bedded in fine coal-ashes in hand-glasses, and stood on the north side of a wall, where they remained all the winter without more protection in hard weather than a mat or a little litter thrown over them. By the spring they were rooted, and were potted off, and grown

FIG. 70.—*CYRIPEDIUM CHARLESWORTHII*.

Upper sepal white, veined with rosy-purple; lower sepals greenish-white; petals and lip yellowish, tinged with brown; stamens white; leaf longitudinally spotted above, transversely beneath. (See *ante*, p. 405, in our last issue.)

dozens having been picked from one house alone; the principal varieties grown being Dymond, Dr. Hogg, Bellegarde, and Mr. Gladstone. Grapes are grown with remarkable success. A magnificent specimen of *Davallia Mooreana* is considered to be the finest in the country, being 13 feet through; and an *Adiantum cuneatum* is noteworthy as being 10 feet through, and many of the plants grown in the house are fine examples of cultural skill.

Hardy fruit outdoor crops were observed as fairly abundant; and some cordon Pears were carrying good crops; the varieties being Pitmaston Duchess, Beurré Hardy, Louise Bonne of Jersey, and Clapp's Favourite.

Dahlias in the various sections are particularly well grown, as is evidenced by Mr. Ocock's recent successes at public exhibitions, and to whom a word of praise is justly due for his excellent management of a beautiful and historic place. *J. B.*

a dry, shrivelled condition; they, much to our surprise, plumped up rapidly, and began to shoot. They have now flowered freely, much better than could have been anticipated, showing that this Lily is really a very vigorous one under proper treatment, but that a cold, sunless summer does not suit it. The scent is very peculiar, being like that of honey. *L. Henryi* is a remarkable Lily; it has been grown by us in pots out-of-doors, and in the open ground. It is a grand doer. We received our bulbs from China in the middle of March last; they soon began to move, and were above-ground some six weeks later than those established at Kew. They are now in full flower, again some six weeks later than those in the open at Kew. This Lily has evidently a very hardy constitution: it can stand drought well, roots very freely, has dark green foliage, and numerous flowers. It is from these points, and from its novel colour, a grand Lily for the hand of the coming hybridiser. There are two grand points about this new form that we wish to emphasise. Its very beautiful broad dark green central axis,

on for planting-out the year following. As compared with present methods of raising *Calceolarias*, there seems to have been a whole year's labour for nothing; but it was only in that way that good bushy profusely-blooming plants of these shrubby species and varieties could be obtained so far north. And what would most present day gardeners think of the practice of keeping *Hoya bella* in a cold vinery after flowering till say the end of January? Yet such was the case, and the plant responded to the treatment by abundance of bloom. *Delta*.

FRUITS: BOTH SIDES OF THE QUESTION.—

Until about three years ago we managed to have a garden of some kind, generally in the town, and always small, the growing of fruit being out of the question, and, of course, we had to depend entirely on the market for this. We are, and always have been, large users of fruit and vegetables, and have had, for townfolks, a very good knowledge of the different varieties, but in spite of this, we have always had an instinctive preference for the largest and best-looking samples. Coming into an old garden stocked with fruit trees, we were at first surprised that so many of the trees, Pears especially, should bear such small and poor-looking fruits, and it is only by experience and knowledge of the best methods of keeping and ripening, we have discovered that the small and insignificant-looking fruit was really the best, and far preferable to the fine samples we were accustomed to purchase. This reminds me of my old friend, Mr. Fogg, who said of his Cucumbers, "Bless you, we don't grow 'em to eat; we grow 'em for market;" and there are two very clear sides to this question. If for sale, appearance is everything; if for private use many of the poorest and shabbiest-looking varieties are better worth care and attention. It is very rarely that one variety will serve both purposes well. The fault, as regards small fruit, is increased by the method of mixing different varieties. In one hamper to-day in the market, I saw a mixture of at least four kinds, two of these being *Beurré Capiaumont* and *Easter Beurré*, the mixture being retailed at 1½d. per lb. If the *Capiaumont* had been separated, properly shown, and named, they would have easily fetched double the price, if not more. The blinding and mixing of varieties does more than anything to bring English fruit into disrepute. Foreign fruit comes over separated, and correctly named; users learn the names and varieties, and naturally ask for what they know, passing over better fruit of home growth because it is unnamed, unknown, and exhibited with no more care than a load of Potatoes, good, bad, and indifferent, ripe and unripe being mixed up in one general mass, which only commends itself to children with halfpennies, because it is cheap. Good *Capiaumont* Pears, English grown, would take the highest rank if they were only known, and sold separately under their correct names for identification by regular users. *Thos. Fletcher, Grappenhall, Cheshire*.

THE ORIGIN OF DAHLIA PARAGON.—We observed in the *Gard. Chron.* of September 23, p. 365, that a correspondent has an idea that we were the raisers of the single-flowered *Dahlia Paragon*, although we have never before published any statement as to the way it came into our hands. At the *Dahlia Conference* held at the Crystal Palace, and presided over by the late Shirley Hibberd, Mr. H. Cannell made a long statement concerning the matter, after which no one should have assumed that we raised it from seed. Its history briefly is this:—A gentleman, a customer of ours, who was about to remove from Yorkshire to Sevenoaks, called at the nursery in September, 1877, and described the splendours of a single-flowered *Dahlia* which he thought no one else possessed, and said that he should be pleased if we would take care of it for him. It had been a great treasure of his for fifty years, but that in consequence of his great age he did not think he should enjoy it much longer. We accepted the tubers, and we have had ever since three plants ready for him, should he call again, so as to be able to carry out our promise; but he has not called again, and not knowing his address, we can only conclude that he is deceased. *H. Cannell & Sons, Swanley*.

RATE OF GROWTH OF CONIFERS.—I recently measured a tree of *Sequoia* (*Wellingtonia*) *gigantea* which I saw planted in 1863, and which was then about 4 feet high. It is now 58 feet high, and the circumference of the stem at 2½ feet from the surface is 8 feet 10 inches. A *Cedrus Deodara*

growing a short distance away, which was planted at the same time, is 49 feet high, and the stem at 2 feet from the surface is 46 inches in circumference. The above are growing at *Wierton House*, near *Maldstone*, at the top of a hill, the soil a medium loam, resting on limestone. *W. H. Divers, Ketton Hall Gardens, Stamford*.

GENTIANA ACAULIS FLOWERING TWICE IN ONE YEAR.—Is it not unusual for this plant to flower twice in one year? We have at the present time, September 20, fully-expanded blossoms of this *Gentiana* on plants growing on the rockery, and which flowered well in May. *E. M.*

STOCKS FOR ROSES.—Last February, in looking through the propagating-houses at Messrs. Keynes, Williams & Co.'s nurseries in Castle Street, Salisbury, Mr. W. H. Williams drew my attention to the difference in the growth of *Roses* worked on the *Polyantha Rose* as compared with that of the same varieties grafted at the same time on the *Manetti* stock. Although the growth of the extensive batch of worked pot *Roses* which I then had the pleasure of seeing was most satisfactory, and the point of "union" scarcely perceptible, the growth of the *Roses* worked on the *Polyantha* was decidedly more vigorous than that of those worked on the *Manetti*; the pots were also better filled with roots. Mr. Williams said that his firm experienced difficulty in obtaining a sufficient quantity of the *Manetti* for stocks, and in answer to my inquiry as to the price of the *Polyantha Rose* in view to its adoption as a stock, he said that large quantities of it could easily be raised from seed every year by growers to meet the demand at a small cost. This being so, we may reasonably look forward to obtaining more vigorous, and consequently longer-lived pot *Roses* in the near future than we have been having, as up to the present time pot *Roses*, under the most favourable treatment have proved to be much too short-lived. *H. W. Ward, Longford Castle, Salisbury*.

BIGNONIA CHERERE AND B. TWEEDIANA.—Amongst the many species of *Bignonias* grown in the *Riviera Gardens*, there are none to rival these two beautiful species. The former is at present rather uncommon, but where seen in its full beauty it is a sight which is rarely excelled. When once it arrives at the age of flowering, that is, in three or four years, the amount of blossom it produces is astonishing; in fact, it is rarely seen out of flower, although it blooms more profusely during the autumn and spring months. I saw last spring at *Mentone* a whole hedge composed of nothing but this climber, and it was quite ablaze with its large panicles of orange-scarlet flowers. It delights in growing in the full sunshine, and does as well in our heavy granite soil. Our climate is rather too cold for *Allamandas*, but in *Bignonia Tweediana* we have everything to be wished for as regards size of blossoms and colour, and the species is seen at its best when running over terrace-walls; and when out of flower, its long, bean-like seed-pods, more than 1 foot in length, have a quaint look. One thing is evident about our *Riviera* climbers, that they have sufficient sun to ripen their wood, and they often have suffered from lack of water. The latter remark may be applied forcibly to our own greenhouse climbers, many of which, especially the *Bignoniaceæ*, are rarely seen to advantage. In many cases, I may venture to state, they are over-watered, and to compensate the lack of sunshine, dryness at the root would often be the means of inducing them to flower better than they do. I find that many of the climbers do not require so much water as is generally supposed; and, in fact, it really does them good to let them suffer. *Riviera*.

RETARDED GROWTH IN A PEAR-TREE.—Your correspondent, H. D. Hearn, in giving an account of his Williams' *Bon Chrétien* Pear-tree (p. 340, of *Gardeners' Chronicle* for September 16) not coming into bud the first year after planting, goes on to say, all he had spoken to about it had never heard of anything of the sort before. It may interest your correspondent, as well as others to know, that, in Kent, some years ago, I remember having had a large-trained Pear-tree of *Marie Louise* transplanted from a north wall to a south one. The work of removal took place in the month of November; the tree was about twenty years old, had ten tiers of branches 16 feet long, and it required four men to carry it. The tree was well planted and well cared for during the spring and

summer following the transplanting, but no signs of growth were visible, not even plumping of the buds the first year; and I well remember also, that many jeers were thrown out by passers-by, one saying, the idea of thinking of transplanting with any chance of success such a large fruit tree, and placing it against a south wall, too. The tree, I had syringed with water occasionally, for the purpose of keeping the bark plump, which had the desired effect. The year following the transplanting, the tree had the appearance of being dead to people passing at a little distance from it; but the second year after the planting, it had developed a large number of blossom-buds, which it was necessary to reduce in number, only leaving a tenth of them, and only a few dozen fruit was allowed to mature. The third year after transplanting, the tree had got good root-hold, and bore ten dozen of excellent fruit. The fourth year the crop was large, and quality good; and fruit taken from the tree the fourth year after planting won three 1st prizes open to all England, in the autumn of that year in the single dish class for *Marie Louise* variety, and an Award of Merit at *Chiswick*, during the *Pear Conference* then being held. This particular tree has produced as many as ten dishes of fruit, winning firsts, open to all England within the last few years. *Robert Smith*.

A SINGULAR NEST.—A few days ago, when the men were employed in cutting the dead wood out of a *Euonymus* tree on the wall, they found a blackbird's nest. On picking it to pieces, they discovered forty-eight wire pegs interwoven with the nest. These being of two sizes, the patient little bird had bent the slightest of the "hairpins," as we familiarly call them here, into waving lines, and then dexterously wattled them in all round. They were counted in presence of the writer and two other ladies. The nest ought to have been preserved intact, and exhibited as a proof of reason and reflection on the part of the blackbirds, who have built in the same place for several years. The gardener had frequently missed his pegs from *Verbenas*, *Carnations*, and other flowers, but certainly he was not prepared to look for them, still less to find them, in a blackbird's nest! *H. M. E., Newbold, Leamington, September 20*.

COLLETTIA BICTONENSIS.—This curious and hardy (in Devon) shrub is flowering extremely well this year, and I noticed to-day it was crowded with bees, extracting the pollen from its curious little creamy-white flowers. Cuttings root readily of half-ripened wood, placed in well-drained pots, and stood in a cold greenhouse. *J. M., Bicton*.

A FINE VARIETY OF TOMATO.—Referring to your notice of the above in last week's *Gardeners' Chronicle*, p. 401, I can fully bear out what you say of the *Tomato* sent for your inspection by Messrs. Cobban & Son, Rotherham. A few weeks ago, I had the pleasure of inspecting two span-roofed houses, each 150 feet long, that were planted with this and all the leading varieties in commerce, and its superiority for cropping and massiveness of individual fruits over the other varieties was abundantly apparent. I have seen very fine crops of *Tomatoes* in different establishments throughout the country, including the *Royal Horticultural Society's Gardens*, *Chiswick*, when the *Vegetable Conference* was held there, but have not met with a variety to equal the one under notice for productiveness, handsomeness, and weight of fruit, many of which weigh more than 1 lb. each. Wherever *Tomatoes* are grown, whether for private use, market, or exhibition, this one will take a leading place. *J. H.*

THEA VIRIDIS (TEA-PLANT).—A bush of the above, 8 feet high, and 4 feet through, is thickly in bloom in these gardens. The flowers are not unlike those of a single-flowered *Camellia*, of a creamy-white, and they appear at the tips of the current season's shoots. The tropical summer, no doubt, has caused the plant to flower so freely. *J. Mayne, Bicton, Devon*.

ONOSMA TAURICA.—This is a plant of much attractiveness, and deserving of special notice. We have had it growing on a small rockery which is fully exposed to the western sun, and despite the excessive drought, it flowered for six or eight weeks with great freedom. It is a pretty graceful plant of 6 inches in height, and forming compact tufts of lanceolate, hairy leaves. The flowers are hand-shaped, bright golden yellow, and produced in long terminal cymes. The plant is perfectly hardy, is

specially adapted to the rockery and the front of herbaceous borders, and should be propagated by cuttings in early spring. *Q. Read, Hampton, Evesham.*

PEASGOOD'S NONSUCH APPLE.—This variety has done well in this neighbourhood. We to-day saw fruit grown in the gardens of Cote House (Mr. Bannister, gardener), on a bush tree, one fruit weighing 1 lb. 12 oz., two fruit weighing 3 lb. 7½ oz., six fruit weighing 8 lb. 13½ oz., and twelve fruit weighing 15 lb. 13 oz. *Jas. Garaway & Co., Durdham Down, Bristol.*

THE ARRANGEMENT OF HARDY FLOWERING PLANTS IN THE GARDEN.—At this time of the year the planting and dividing of herbaceous plants will occupy the gardener's attention, and these plants may be grown in formal beds and borders, and are beautiful everywhere; the planting of them in long, narrow borders is not generally to be admired. The most enjoyable way of planting them is in recesses, which may be of different sizes—here a nook and there a nook, some in the full sunshine, others in the shade, amid trees and shrubs. In the latter position may be planted such plants as dislike being disturbed at the root, as well as bulbs that may be left in the ground from year to year. There is in most large gardens no difficulty in finding a place for everything worth growing. Some look well in masses all of one colour, whilst others are best when mixed. Within the past few years much floral wealth has been afforded the planter, as, for instance, Paeonies, herbaceous and the Moutan or tree varieties, which when planted in masses, and well cultivated, have few equals. Lilies of all kinds again, Teas and hybrid perpetual Roses, and the old-fashioned climbers should not be omitted. The white and red Provence, the Moss, and the old summer Roses; white Jasmine, Honeysuckle, Wallflowers, Clove-scented and other Carnations, Lavender, Rosemary, Southernwood, white patches and banks of Lily of the Valley, Violets, &c. Sweet Briar is nice when used for hedges, or left to grow at will at the back of a group, in which stage it is always an attractive plant. The tall and stately Hollyhocks, Larkspurs, Pampas Grass, Yuccas, &c., and large masses of the Japanese Anemone, are always pleasing to the eye. The old-fashioned type of Musk, hardy Henths, London Pride, and the alpine Phloxes should be planted in patches suitable to them. The above are only a few of the many beautiful plants available for the beautifying of the flower garden, and they should always be included where possible. Plenty of scope will be found for the display of climbing and creeping plants. A growing demand and increasing love for plants and flowers are penetrating into every home of the rich and the humble folk, and it is by increasing the above class of plants that the million can be supplied with flowers fresh and cheap. All who have gardens, large or small, should fill their gardens with a suitable selection, properly and tastefully arranged. They will then reap the full enjoyment a garden can give. *A. Evans, Lythe Hill.*

SOCIETIES.

CRYPTOGAMIC SOCIETY OF SCOTLAND.

SEPTEMBER 19, 20, 21.—The nineteenth annual conference of this Society was held at Moffat on the above dates. Colonel Stirling, of Gargunnoch, presiding. Moffat is widely known as a popular health resort, its mineral waters having long been famous. Whatever benefit these may confer on the invalid, must be greatly enhanced by its delightful atmosphere and beautiful scenery. In the immediate neighbourhood there is a charming variety of scenery, of wooded hills, ravines, and streams. The hill scenery is peculiar to the south of Scotland. It lacks the rugged character of most of the Scottish mountains. There is much sameness in its great green billows; yet its quiet pastoral beauty has a charm of its own. The whole district is rich in associations, lying as it does between the land of Burns and that of Scott and Hogg, the "Etrick Shepherd." It forms part of the old border-land, which has been celebrated in romance and song.

At the business-meeting of the Society a valuable paper on the "Mosses, Hepaticas, and Lichens of the Moffat District," by Mr. James McAndrew, New Galloway, was submitted. Mr. D. A. Boyd also contributed "Notes on various Micro-fungi observed in

the Killin District, Perthshire." A lengthened discussion took place on the publication of the Society's Records, and it is hoped that, ere long, its *Transactions* may contain a first instalment of these. We would take this opportunity of appealing to English botanists to aid in a work which must prove invaluable to them, by joining the membership of the Society.

By the kind permission of the various proprietors, excursions were made to the neighbouring woods. Ruelhills Glen and Lochwood Tower—a ruin which is surrounded by Oaks, whose goarled trunks are the growth of centuries; Garpel Linn, Craigielands, Dumcrieff, Gallowhill, and Gardenholm, were all visited, and proved fruitful fields for the Cryptogamic botanist. Many species of great interest were gathered. The following may be noted:—Mosses: *Tortula laevipila*, Brid.; *Hypnum patientiæ*, Lindl.; *H. crista-castrensis*, Linn. Lichens: *Stictina fuliginosa* (Dicks.), Nyl.; *Loebaria pulmonaria* (Linn.), H. Hon.; *Parmelia conspersa* (Ehrb.), Ach.; *Nephromium lusitanicum* (Schaer), Nyl. Fungi: *Agaricus virosus*, Fr.; *A. pterigenus*, Fr.; *A. hæmorrhoidarius*, Kalch.; *Fistulina hepatica*, Fr.; *Tremellodon gelatinosum*, Pers.; *Kneiffia setigera*, Fr.; *Anthina daumeni*, Fr.; *Helvella elastica*, Bull.; *Hypomyces rosellus*, Tul.; *Ustilina vulgaris*, Tul.

It is worthy of note that *Tremellodon gelatinosum*, one of the most beautiful of fungi when well-developed, has not hitherto been found in Scotland, except in Dumfriesshire. A single specimen, finer than any since met with, was sent to the fungus show at Dumfries in 1883. It was found in several places at Moffat.

In most districts of Scotland during the past season, owing, doubtless, to continued drought, fungi have been conspicuous by their absence. We were fortunate at Moffat in compiling much longer lists of species than we had anticipated.

The next annual conference of the Society will be held at Stranraer, Wigtonshire. *J. S., Glamis.*

DEVON AND EXETER GARDENERS' ASSOCIATION.

SEPTEMBER 27.—The annual business meeting was held on the above date, at the Guildhall, Exeter, under the presidency of Major Tracey, of Pytte House, one of the Vice-Presidents of the Association. There was a large attendance of members.

Major Tracey, in opening the meeting, spoke of the good that was being done by the Society, the interchange of ideas and theories of cultivation being of great value to the members, who, for the most part, were working gardeners.

The committee's annual report, read by the Hon. Secretary, Mr. A. Hope, stated that it was with a sense of gratification that the committee presented a favourable report of the work of the past year. To show the scope of the work and the wide variety of subjects treated, a list of them was given, and the report proceeded to state that the subjects were of a practical and interesting character to the members. The most valuable feature was that in all cases the essayists were specialists in the particular subject in hand. This naturally added considerable weight to their opinions and the conclusions arrived at. The discussions which followed were eminently practical. As was reported at a meeting of the Association, the County Council did not accede to the application of this Association for a grant towards technical instruction in gardening, but the fact that a sum has been granted in some other districts for a similar purpose leads the committee to hope that the Association—one of the most important of its kind in the county—may in the near future be recognised as a proper medium through which to further the benefits of technical education in horticulture in this neighbourhood, especially in the direction of hardy fruit-growing. The papers delivered during the session have been published. The report then made reference to the visits made by the members to the gardens in the neighbourhood, and the outings proved as educational as they were social. The expenses incurred in this connection were borne entirely by those taking part in them. No part of the funds of the Society were used for that purpose. Since the last report the Association had become possessed of a large number of books on gardening, thus forming the nucleus of a good library. They were indebted to the Library Committee of the Albert Memorial Museum, through Mr. Dallas, for many of these. Thanks were also due to Miss Crocker, of Bovey Tracey, for her handsome gift of books. The committee also ex-

pressed their indebtedness to the Mayor and City Council for the use of the Council Chamber, and to the Rev. Dr. Dangar for the use of the Lecture Hall of the Training College on one occasion. Thanks were given to the local and London Press for notices of the proceedings of the Society; also to several gentlemen who showed interest in and subscribed to the funds of the Society. Both as regards the numbers on the roll of membership (over 100), and the balance in hand (upwards of £20), the position of the Association is a satisfactory one, and it now enters on its third year of existence with every prospect of success.

Mr. W. Mackay (Hon. Treasurer), presented a report. The subscriptions for the year amounted to £23 13s. 6d., against £20 8s. 6d. last year; and the balance in hand was £20 12s. 3d.

On the motion of the Chairman, the report and accounts were adopted.

The election of office-bearers for the year was then proceeded with.

Mr. Hope moved that Sir Dudley Duckworth-King, Bart., of Weir House, be elected President for the ensuing year, which was carried unanimously.

The name of Mr. James Dallas, Honorary Curator of the Albert Memorial Museum, was added to the list of Vice-Presidents, and the present Honorary Secretaries (A. Hope and T. E. Bartlett), and Hon. Treasurer (W. Mackay) were re-elected. "*Devon and Exeter Daily Gazette*," September 29, 1893.

NATIONAL CHRYSANTHEMUM.

NEW CHRYSANTHEMUMS.—Two meetings of the Floral Committee of the above Society have recently been held, at which new Chrysanthemums were submitted for approval. First-class Certificates of Merit were awarded to Mr. E. Rowbottom, Priory Road, Hornsey, for Edwin Rowbottom, an early Japanese fit for exhibition, good in size, of the type of Madame C. Desgranges, but reflexed like Avalanche—in colour, bright yellow; also to Mr. Norman Davis, Lilford Road Nursery, Camberwell, for a reflexed Japanese, named Samuel Barlow, of the colour of Margot, but with twisted petals; dwarf growth, only 2½ feet high, and a very promising English seedling. Another early Japanese of a promising character, as a decorative variety, named M. Gustave Grunerwald, white, with slight tinge of yellow, was shown both by Mr. N. Davis and Mr. W. Piercy, and the committee wished to see both varieties again. At a subsequent meeting held on September 27, M. Gustave Grunerwald was shown again by Mr. Davis, he having a dwarf bushy plant that was profusely bloomed. It was awarded a First-class Certificate of Merit as an early-flowering decorative variety. Mr. Davis also showed H. Shoemsmith (Japanese), the colour a shade of primrose-yellow, changing to white; petals broad and solid, reflexed as regards the basal, the centre ones incurved. As only one bloom was expanded, the committee desired to see it again.

A First-class Certificate of Merit was unanimously awarded to Mr. R. Owen, Castle Hill Nursery, Maidenhead, for Mrs. C. B. Myers (Japanese), a large reflexed bloom, white, the centre primrose-yellow, of very fine character.

Mr. W. J. Godfrey, nurseryman, Exmouth, sent two Japanese varieties, one an English seedling, Devonshire Lass, pale cream, with a slight yellow centre, the centre petals yellow—a promising variety, which the committee wished to see again; and Madame Edouard Rey, one of M. Calvat's raising, pale amaranth, or deep pink or rose, the broad incurved petals having a silvery reverse—a very promising bloom, which the committee wished to see again. Mr. E. Beckett, The Gardens, Aldenham House, Eilstone, sent delicatum, a bluish "Japanese", with thread-like petals, reflexed, full, and very pretty. A First-Class Certificate of Merit was also unanimously awarded to Mr. E. Rowbottom, The Priory Gardens, Hornsey, for Japanese President Bovil (Calvat), magenta, Rose, or pale amaranth, with a golden reverse; a very fine reflexed flower of excellent quality.

INTERNATIONAL EXHIBITION AT LIEGE.

THIS recent exposition, organised by a federation of the Horticultural Societies of Liège, has succeeded beyond all expectation. We will give here a brief account of the principal exhibits; a complete list would prove too long, although there is much which merits notice. Among the numerous exhibits from the well-known firm of Jacob Makoy

et Cie., and occupying the place of honour, are ornamental plants, such as *Chamaerops arborescens*, a distinct variety with deeply-cut leaves; *Pandanus ornatus*; a large specimen of *Rhopala corcovadensis elegans*; *Dracena lentiginosa*, not widely known, but useful for trade purposes; *Carludovica Drudei*, very decorative; and *Eugenia oleifolia*.

Among a number of large and beautiful Palms, we may mention *Phoenix rupicola*; *P. macrocarpa*, a handsome and rare species; *Kentia Forsteriana*, and an excellent specimen of the rare *Trinax graminifolia*. Of great beauty were the dozen fine specimens of *Araucaria*, furnished with leaves from base to crown; the rare *A. Niepraschki Regaliana*, also rare; *A. excelsa gracilis*, not in commerce; and *A. Cunninghami glauca*, in full beauty; these were the most noteworthy. A fine specimen plant of *Araucaria Ruiei* was shown, a sample of good cultivation. Among the best of the greenhouse Conifers, also from Jacob Makoy et Cie., we noted the rare *Dammara hypoleuca* and the curious *Araucaria brasiliensis grandis*. The "plantes d'appartement" included among others a *Cycas neo-Caledonica*, very ornamental and pleasing; and an exceedingly decorative plant of *Rhopala corcovadensis elegans*. There was a very praiseworthy lot of forty miscellaneous plants from the same firm, containing some choice specimens; we may name *Anthurium Kerchovei*, from *A. ornatum* × *Veitchi*, and not yet in commerce, chiefly remarkable for the size of the leaf, the plant is very fine; a pretty *Carludovica elegans*, *Cupania filicifolia Makoyana*, much more elegant than the type, and we are told more easily multiplied; fine specimens of *Spathiphyllum Ortgiesi* and *Dieffenbachia Fournieri*, this latter not yet in the market; *Dracena Douceti*, and a good example of *D. regia*. Among the most beautiful greenhouse plants with coloured foliage, we may enumerate *Ananassa penangensis* var., *Curculigo recurvata* fol. var., *Croton Hlanburyanus*, *Philodendron corsinianum*, *Nephtytis picturata*, a beautiful group of *Abutilon*, *Souvenir de Bonn*, and *Dracena fragrans aureo-striata*. The Bromeliads from this firm included *Vriisia Lubbersi*, very rare; *V. Crouseana*, not yet in commerce; *V. leodiensis*, and *V. Quintusiana*, very interesting. Among their new plants there were several worth notice. In the first place a promising *Dracena* which will take a high place for grouping purposes; it is an introduction from Fernando Po, and dedicated to M. Francis Büchuer, a nurseryman of Munich, and general president of the international jury of the Liège Exhibition. *Dracena Büchneriana* is remarkable for long and fine leaves of dark green colour, glossy, coriaceous, undulated, the sides whitish, and very decorative—the largest leaf was nearly 5 feet across. We should also mention *Strobilanthes Dyeriana* (from the East Indies), *Pandanus Baptisti* (Oceania), with beautiful leaves striped with yellow—one of the best plants in the market; *Begonia decora* (Penang), of compact habit, with pretty leaves, with pale yellow-green veins, the intermediate spaces bearing little risings tipped with hairs. These excrescences are of a rich reddish-brown bronze colour, or purplish-brown, gradually shading into deep metallic green. *Vriisia Quintusiana* (Brazil) bears broad leaves with dots of brown on them, and is very ornamental; so are *Tradescantia reginae*, *Peperomia metallica*, *Smilax argyrea*, and *Hypolytrum Schroderianum* (Brazil). This latter resembles certain *Pandanus* in habit, the leaves are tinged with purple at the base with purple veins. We noted also *Hoplophytum Maranta icouifera argentea*, and *Heliconia Lubbersi* (Columbia), a capital plant, leaves satiny, olive green, shaded with a deeper tone, and most brilliant towards the centre of the blade, which seems as if made of satin; the midrib rose-carmine, bordered four-fifths from the base with white, merging little by little towards the tip into pure white; the petiole and the under-side of the blade claret-coloured. This firm also showed many fine collections of Orchids; we may name *Vanda Kimballiana*, *Oncidium papilio*—very fine, *Cattleya gigas imperialis*, *Lycaste Skinneri*, *Odontoglossum hictonense*, *O. hastilabium*, *Cattleya Dowiana aurea*, *Vanda cœrulea*, *Cypripedium nitidissimum*, *C. Ashburtoniae majus*, *C. Harrisianum Wallaerti*, *C. bellatulum Mariae*, *C. quantum superbum*, *Odontoglossum Leonieae*, and *Oncidium incurvum*, a well-grown specimen, with nineteen flower-stems, and about 2500 blooms. There was also a collection of exotic Ferns, which gave a good idea of these beautiful plants; there were the new *Pteris Wallichii*, *Woodwardia radicans cristata*, *Nephrolepis platyphylla*, the pretty *Stenochlœna scandens*, and *Gonio-*

phlebium neriifolium. The Crotons were excellent in cultivation and colouring; the Cannas included some good novelties. In a word, the firm of J. Makoy et Cie. staged most praiseworthy exhibits, and won the prix de l'honneur of the floricultural section.

Among the exhibits of other growers, we should notice a well-grown *Phrynum* Lubbersi and fine specimens of *Dracena Baptisti* and *D. Bergmanni*, from M. Jos. Chamont, who staged twenty-five *Heliotropes* in bloom, remarkably well cultivated, and eliciting from the jury an increase in the value of the medal, which was awarded *par acclamation* and *avec felicitation*. M. Debeur, an amateur, sent some excellent things, notably *Washingtonia robusta*, *Sabal palmetto*, and *Cocos Romanzoffiana*, all good plants. A nurseryman, M. Marvet-Postalà showed, among other plants, a fine *Pritchardia robusta*, and a tall *Areca sapida*, also a fine plant of *Dracena fragrans fol. aureo-striata*, *Phyllotaenium Lindeni*, and *Strobilanthes Dyeriana*, *Cocos campestris*, some fine Cannas, Pinks, flowering *Chrysanthemums*, *Bouvardias*, *Pentstemons*, &c. Another Liège firm, Joiris et Frère, was also noticeable for the number and excellence of their exhibits, which included *Selaginellas*, tuberous *Begonias*, zonal *Pelargoniums*, *Fuchsias*, *Dahlias*, *Bouvardias*, *Lantanas*, *China Asters*, &c. MM. Duriez Frères sent some good things; in the mixed collection were *Rhapis humilis*, *Asparagus tenuissimus*, of unusual size; a very fine *Pteris Rex*, *Dracenas*, among which was *D. Lindeni*, noticeable for its beautiful colour, and *D. Douceti*; there were also greenhouse plants with coloured foliage of which *Phyllotaenium Lindeni superbum* was the most ornamental, and exotic Ferns; also large and handsome specimen plants wonderful for cultivation and freshness, the most worthy of note were *Nephrolepis Davallioides furcans*, *Didymochlœna pulcherrima* and various varieties of *Adiantum*. The fifteen exotic Ferns from M. J. Chamont fils were notable for freshness, good cultivation, and variety.

Miltonia Blunti Lubbersiana, from M. Jules Hye, is a valuable Orchid; the flower is large, peculiarly spotted, of a rich deep colour—the specimen bore four flower-stems, with a dozen blooms. *M. Moreliana superba* was remarkable for the size of its divisions and the darkness of their colour; *Cypripedium giganteum*, which won distinction at the Ghent meeting, obtained here also a First-class Medal. This exhibition proved a great success, thanks to the united efforts of all its promoters in this important horticultural centre. *Ch. de Bosschère*.

THE APIARY.

DRIVEN BEES.

BEES driven from straw skeps that can generally be obtained in most country districts in the autumn, are very useful for making fresh colonies or strengthening any stocks in the apiary that are weak. In utilising them to make fresh colonies, they should, if possible, be put on built-out combs, and if the latter are stored, so much the better. Five or six pounds of driven bees treated in this way, will make a good stock for next year. If it is required to make driven bees build combs, they should be obtained as early as possible, preferably in August, and there will then be time for brood to be raised, and a fair number of young bees to go into winter-quarters, as the temperature will in that month be favourable for comb-building. The great difficulty in August, however, is to get the bees, as cottagers generally think it too early to part with them, and are not inclined to have their honey taken until they are satisfied that there is no more to be gathered. As a matter of fact, hives decrease in weight in most districts as soon as the Lime trees and White Clover have done blooming. If driven bees are required for strengthening weak stocks, great care should be taken in uniting, as this is very risky work if not properly done. The safest way is to put the driven-bees on combs, and stand them for a few days in a hive by the side of the stock to which it is wished to unite them. Then late in the evening the frames may be lifted out with the bees on them and transferred, after dusting each lot with flour.

Uniting weak Stocks.—Stocks that are weak and not likely to live through the winter should be united, choosing the evening for the operation. If the hives do not stand close enough together, to save the time and troubles of bringing them nearer at the rate of 3 feet a day if the entrances are closed, and the bees

shut in for three or four days with bits of perforated zinc, the hives may be placed anywhere without the bees going back to their old stands.

Self-hivers.—Should it be found after the experience gained from another swarming season that self-hivers are to take a place amongst the necessary appliances required for successful bee-keeping, a very ingenious invention has been patented by Mr. Howard, and will, no doubt, come to the front. The arrangement consists of a drawer, the bottom being covered with queen-excluding perforated zinc, which fits beneath the floor-board of the hive. The queen is prevented from leaving at swarming time through the entrance to the hive being covered with queen-excluding zinc, her only exit being down a wire cone, which conducts her through the floor-board into the drawer beneath. The bees go out and cluster, and as the queen does not join them, they return in search of her, and simply remain in and about the drawer, so that they are practically made to swarm underneath their own hive. The drawer is also a splendid drone-trap, by means of which every drone in the hive can be caught, and destroyed without trouble; but it becomes a question if a colony of bees without drones would ever attempt to swarm, so diverse would it be to their natural instinct, so that the invention may possibly solve the present apparently insuperable difficulty of preventing swarming. *Expert.*

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather for the week ending September 30, is furnished from the Meteorological Office:—

"The weather continued very changeable and unsettled, with heavy falls of rain at almost all the western and extreme northern stations, and frequent sharp showers in the south and east. Thunderstorms were experienced at some of our south-eastern stations at the close of the period.

"The temperature was rather below the mean in the north and east of Scotland, but elsewhere it was

about its normal value. The highest of the maxima, which occurred on the 27th over England, and on the 28th over Ireland and Scotland, ranged from 68° in 'Scotland, E.,' and the 'Midland Counties,' to 59° in 'Scotland, N.' The lowest of the minima were experienced during the early days of the period, when the thermometer fell to 25° in 'Scotland, N. (at Lairg), to 30° in 'Scotland, E.,' and 'England, S.W.,' to 31° in 'Ireland, S.,' and to between 33° and 37° in most other districts; in 'England, N.W.,' however, the lowest reading was 40°, and in the Channel Islands, 46°.

"The rainfall was a little less than the mean in 'Scotland, E.,' 'England, E.,' and the 'Midland Counties,' but in all other districts there was an excess, that in 'England, N.W.,' being very large. At Stonyhurst the aggregate fall for the week was as much as 4.04 inches.

"The bright sunshine was less than the normal amount in most districts, the percentage of the possible duration ranging from 41 in the Channel Islands, 39 in 'England, S.W.,' and 38 in England, S., to 24 in 'England, N.W.,' and 20 in 'Scotland, W.'"

MARKETS.

COVENT GARDEN, October 5.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, Ed.]

PRICES rule as last week.

POTATOS.

Trade continues in a very unsettled state, and prices very low, except for very best samples, which are readily picked up at from 85s. to 95s.; Medium, 55s. to 70s.; Black Lands, 40s. to 45s. J. B. Thomas.

SEEDS.

LONDON: Oct. 4.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's market presented no special feature of interest,

Orders for Trifolium still come to hand; prices have now fallen to a very low level. Winter Tares are much wanted; quotations very firm. Rye is steady. For Canary seed there has lately been a revived and greatly improved consumptive demand; values in view of the extremely light stocks held, exhibit great strength. There is no change in Mustard and Rapeseed. Blue Peas and Haricot Beans meet a better inquiry.

FRUITS AND VEGETABLES.

BOROUGH: October 3.—Quotations:—Cabbages, 4s. to 7s.; Cauliflowers, 5s. to 8s. per tally; Turnips, 1s. to 1s. 6d.; Carrots, 2s. to 3s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 4s. to 5s. per bag; Damsons, 1s. 6d. to 2s. 6d.; Plums, 2s. 6d. to 3s. 6d. per half-sieve; Apples, 2s. to 8s. per bushel.

STRATFORD: Oct. 4.—There has been a good supply of all kinds of produce at the above market during the past week, and a brisk trade was done at the undermentioned quotations:—Cabbages, 4s. to 8s. per tally; Savoys, 5s. to 7s. 6d. per tally; Cauliflowers, 9d. to 2s. per dozen; do., 3s. 6d. to 9s. per tally; Turnips, 2s. to 2s. 6d. per dozen bunches; do., 40s. to 50s. per ton; Carrots, household, 45s. to 55s. per ton; cattle-feeding, 30s. to 42s. 6d. per ton; Mangels, 22s. 6d. to 28s. per ton; Swedes, 27s. to 30s. per ton; Onions, English, 170s. to 130s. per ton; Dutch, 5s. to 5s. 6d. per bag; Porto, 6s. to 6s. 6d. per box; Apples, English, 2s. to 4s. 6d. per bushel; Brussels Sprouts, 3s. to 4s. per sieve; Scarlet Beans, 3s. to 3s. 6d. per sieve; Celery, 9d. to 1s. 3d. per bundle; Horseradish, 1s. to 1s. 9d. per bundle; Cucumbers, frame, 1s. 3d. to 2s. 6d. per dozen.

FARRINGTON: October 4.—Quotations:—Cauliflowers, 5s. to 8s.; Cabbages, 4s. to 7s. per tally; Turnips, 1s. to 2s. 6d.; Parsley, 2s. to 2s. 6d.; Carrots, 2s. to 3s. per dozen bunches; Onions, 4s. to 5s. per bag; Horseradish, 1s. 6d. per bundle.

FARRINGTON: October 5.—Quotations:—Apples, 2s. 6d. to 3s. 6d.; Pears, Calabasse, 6s. to 7s.; common, 2s. 6d. to 3s. per bushel; Melons, 3s. to 4s. 6d. per case; Grapes (Almeira), 11s. to 13s. per barrel.

POTATOS.

BOROUGH AND SPITALFIELDS: October 3.—Quotations ranged between 40s. and 100s. per ton.

STRATFORD: October 4.—Quotations:—Dark-lands, 42s. to 50s.; light do., 45s. to 60s.; Sutton's Abundance, 65s. to 80s.; Hebrons, 70s. to 90s. per ton.

FARRINGTON: October 5.—Quotations:—Hebrons, 80s. to 100s.; Regents, 60s. to 80s.; Magnums, 45s. to 60s.; other kinds, 40s. to 60s. per ton.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

BELLADONNA LILY.—Will some of our readers who have been successful in flowering the Belladonna Lily in pots, kindly afford "W. F." details of method of culture.

BULBS PERFORATED BY TWITCH: P. M. T. This is not an uncommon appearance, but how it was effected was for a long time a puzzle. The explanation now accepted is that the twitch secretes a fluid at the tips which softens and dissolves the coats of the bulb, and allows the grass to penetrate; see fig. 71.

CARROTS: W. G. The roots have been eaten probably by wire-worms.

EQUISETUM ARVENSE: L. The blocking of drain pipes by the roots of this plant is not uncommon. We know of no means of checking it, save by continuing to drain the field. As the land gets dry, the weed will die out. It will be better to use rubble stones instead of pipes, making a V-shaped bottom to the drain, placing soda or hrushwood over these.

GRAPES: W. H. M. The best white Grape for a mixed house is Foster's Seedling. Muscats are often a failure in such a position. A variety called Lady Hutt, of recent raising, is considered a very good Grape, and is a first-class keeper.—E. K. The berries are in every case badly shanked, which accounts for their shrivelling and falling-off. The causes will be found at the root, probably—roots very deep in the soil, a soured soil, waterlogged border, entailing loss of the finer roots; these are the usual causes, but shanking may be due to overcropping, or sudden check to

growth. Without seeing the Vines and the border, we cannot do more than indicate the probable causes. It may be taken for granted that perfectly healthy Vines are not afflicted with shanking. The leaves sent were thin, small, and covered with red-spider in the case of one of them, and the wood was not robust.

NAMES OF FRUITS: (Some delay has unavoidably occurred in furnishing the names.) A. B. 1, Beurré Clairgeau; 2, next week; 3, Pitmaaston Duchess; 4, Beurré Bachelier; 5, decayed.—W. B. S. 2, Swan's-egg; 3, Huyshe's Victoria; 4, rotten; 5, not known; 6, White Doyenné.—H. G. B. Pear Sanguinole, or Blood-pear.—F. Bat. Fruit all bruised beyond recognition.—D. E. 1, not recognised; 2, Rymer; 3, Albriston; 4, Red Autumn Calville; 5, Easter Beurré very early; 6, rotten.—P. G. 1, Waltham Abbey Seedling; 2, Ribston Pippin; 3, Cellini; 4, Hawthornden; 5, Catshead; Pear Beurré de Capiaumont. B. & S. Apple Tower of Glamis.—J. T. A. 1, Cox's Pomona; 2, decayed.—

FIG 71.—POTATO PERFORATED BY COUCH GRASS ROOT.

W. H. B. Not known, most probably a local variety.—C. E. 1, Fondante d'Automne; 2, not recognised; 3, Marie Louise; 4, Beurré Boac. F. H. C. Apple too small to be of any value; name certainly not known.—W. G. L. 1, Beurré Diel; 2, Duchesse d'Angoulême; 3, Bezi Goubault; 4, Glou Morceau; 5, not recognised, most resembles Souvenir du Congrès; 6, Scarlet Nonpareil.—Oxon. The specimens received were all rotten, excepting No. 3, and this we cannot determine.—M. H. 1, Bergamotte d'Espereu; 2, Napoleon; 3, Marie Louise d'Uccle; 4, rotten; 5, Beurré d'Amanlis; 6, Cellini.—J. F. Apple Small's Admirable, Plums too far gone (send other Pears or Apples now).—J. R. W. 1, Red Autumn Calville; others rotten.—W. Milford. 1, Souvenir du Congrès; 2, Belle de Bruxelles; 3, Beurré Rance; 4, Autumn Bergamotte; 5, Catillac; 6, Easter Beurré—Cedars. 1, Yorkshire Greening; 2 and 3, Dumelow's Seedling; 4, Manks Codlin; 5, not known; 6, Court Pendu Plat.—J. G. 1, Jefferson; 2, Gravenstein; 3, Hawthornden; 4, Cox's Pomona; 5,

not known, a miserable kind; 6, Stone's Apple; 7, Beurré Diel; 8, Maréchal de la Cour.—*J. R. B.* 1, Blenheim Orange; 2, Cellini.—*H. N. O.* 1, Napoléon; 2, Beurré Bosc; 3, Duchesse d'Angoulême; 4, Easter Beurré; 5, Bergamotte d'Esperen; 6 Marie Louise.—*F. H. O.* 1, Doyenné du Comice; 2 and 3, Beurré Superfin; 4, Duchesse d'Angoulême; 5, not known.—*F. Waterman.* 1, Lewisia Incomparable; 2, a local seedling, most probably.—*A. J. N. Barchard's* Seedling.—*W. Parnell.* 1, Minshall Crab; 2, Golden Reinette; 3, not quite sure of; 4, American Mother.—*W. G. T.* 1, Court Pendu Plat; 3, Beauty of Kent; 4, Queen Caroline; 5, King of the Pippins.—*J. T., Appleby.* Apple Small's Admirable.—*S. W. S.* Pear Duchesse d'Angoulême. *W. Rawlings.* 1, General Tottleben; 2, Pitmaaton Duchess; 3, Beaa Pool; 5, Marie Louise; Apples: 2, rotten.—*J. E. Don.* 1, Louise Bonne of Jersey; 2, Marie Louise d'Uccle; Beurré Bosc; 4, Maréchal de la Cour; 5, not known; 6, Ribeton Pippin.—*Mc.* Beurré Bachelier.—*J. W. Smith.* 3, Louise Bonne of Jersey; 6, Marie Louise d'Uccle; 7, Napoléon; others decayed—all past their season.—*C. E. S.* 1, Lady Henniker; 2 and 8, Blenheim Orange; 3, Bedfordshire Foundling; 4, King of the Pippins; 6, Dumelow's Seedling; 7, Winter Peach; 11 and 12 King of the Pippins; others not recognised.—*N., in biscuit-box.* 1, Louise Bonne; 2, Thompson's; 4, Flemish Beauty; 5, Yellow Buckland; 6, Wadburst Pippin.—*W. Lowther.* Apple Duchess of Oldenburg, much decayed; 4, Beurré Clairgeau; 5, Williams' Bon Chrétien; 6, not recognised.—*W. G. S.* Peagood's Nonsuch.—*W. W. Manks* Codlin.—*Anon.* 1, Landsberger Reinette; 2, Cambusnethan Pippin; 3 Pear Knight's Monarch; 5, Beurré Rance; 6 Charlotte de Bromer; 7, Apple Cox's Orange Pippin.—*E. W. C., Putney.* 1, Cellini; 12, Winter Hawthornden; 10 and 11, King of the Pippins; 6, Grenadier; 16, Lord Grosvenor; 9, Royal Somerset; 18, Winter Peach; 4, Norfolk Beeing; 5, Blenheim Orange; 8, Pear Marie Louise, others decayed, or too small. Received with thanks, your postal-order, value 5s., for naming fruits. Order has been sent to the Gardeners' Orphan Fund.

NAMES OF PLANTS: *A. B.* 1 and 2, varieties of Nerine curvifolia (Fothergilli); 3, N. sarniensis; 4, N. corusca major.—*W. M. L.* Smilax lanceolata, probably; we cannot determine without flowers, and it was a wretched scrap that was sent.—*K. and B.* Chrysanthemum maximum, true. The Helianthus and the Coreopsis we cannot name from the specimens sent, they are all good.—*Worksop.* 1, Quercus cerris; 2, apparently a Castanea; 3, 4, perhaps a Cerasus; we cannot tell from the leaves only.—*Q. R.* Eccremocarpus scaber.—*F. D. and S.* Helianthus multiflorus, a good form.—*G. A. M.* 1, Escallonia macrantha; 2, Pernettya mucronata; 3, Kalmia angustifolia; 4, Rosa moschata; 5, Foreythia viridissima; 6, Ligustrum lucidum.—*F. R.* Should address the Editor. The Publisher's department is financial, and quite distinct from the editorial: 1, Agave americana variegata; 2, Solanum jasminoides; 3, specimen insufficient, may be Libonia floribunda; 4, Clematis flammula; 5, Teucrium fruticans; 6, Griselinia littoralis.—*D. Wallace.* Viburnum opulus. British shrub.—*F. W. R.* The labels were displaced in opening the parcel. The one with oblong fruit we take to be a form of Crataegus coccinea, the other with globular fruit we cannot match exactly. We think it also may be a seedling form of coccinea.—*E. M. C., Kingstown.* Liparia longipes.—*P. C. S., Coventry.* 2, Phyllanthus nivosus; 1, Cologyne fimbriata.—*W. L., Glasgow.* B-gonia heracleifolia.—*H. D., Sydney.* Dendrobium atro-violaceum, New Guinea; D. macrophyllum alias Veitchianum.—*W. S. C. P.* 1, Sievthymbium bermudianum; 2, S. graminifolium; 3, Gladiolus punctatus.

ROMNEYH COULTERI: *G. M.* Yes, often.

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered

HOT-WATER BOILERS,

Others with TUBES, SHELVES, & HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

REAL MANURE.

To make up for the loss
from drought, it is absolutely
necessary all should use the
above immediately. Its effect
is marvellous. Just one
powerful ingredient makes it
far superior to all others.

MR. NOAH KNELLER,
Malshanger Pk., Basingstoke
Has had his supply, and says:
"The exact dimensions of one
Oun, 7 inches across, 19 inches
round, weight 2 lb. 9 oz.; twelve
Onions weighing 24 lb., which I
exhibited at Reading. Grown
solely by the use of CANNELL'S
REAL MANURE. A farmer said
that he wished his Swedes were
as big as my Onions."

COWMAN.—Age 21, single; willing to assist in Garden. Experience with Cows, Pigs and Poultry. Good character.—E. JENNER, Oaklands, Wimbledon Park, Surrey.

A FREE CHRISTMAS GIFT FOR EVERYONE would be an announcement certain to command the respectful attention of all persons to whom it might be made, and the philanthropist intending such a wholesale expression of "goodwill to all men" would find the order a larger one than could be conveniently carried out. The majority of persons, however, who regularly use HOLLOWAY'S PILLS would have a free gift at Christmas time more precious than any that can be purchased for money, viz., the blessing of health and the capacity for all rational enjoyment. If this wonderful medicine is taken according to directions, it will not fail either to effect a cure, or give relief even in the worst cases of disease.

FOSTER & PEARSON, Lmtd., 22 FIRST PRIZES.

Established 1841.

CHRYSANTHEMUM EXHIBITION.

NORMAN DAVIS

begs to intimate that his magnificent Exhibition of these popular flowers is now open, free of charge. No one interested in Chrysanthemums should fail to visit this, "the oldest and best trade show." (Open all Sundays in October for private inspection only.)

Notwithstanding the splendid Novelties distributed by me last season, and which are giving such unbounded satisfaction all over the country, I feel confident that the present season's Novelties will surpass all previous introductions. Scores of splendid Novelties in all fantastical shapes, and remarkable for their distinctness, are now opening.

CHRYSANTHEMUM NURSERIES, LILFORD ROAD (Near Loughborough Junction), CAMBERWELL, LONDON, S.E.

N.B.—500 Plants of the New "GOLDEN VIVIAND MOREL," and almost as many "WILLIAM SEWARD," are alone worth a visit.

F. V. RASPAIL GERANIUM.—Strong-rooted Cuttings, £2 10s. per 1000, or 6s. per 100. Cash with order.—P. ROULTON, Beechenlea Nursery, Swanley.

Important to Mushroom Growers.

NEW AND MAGNIFICENT CYPRIPEDIUM CHARLESWORTHII

(ROLFE, N. SP.)

Exhibited and unanimously awarded a First-class Certificate by the Orchid Committee of the Royal Horticultural Society, and pronounced by every one to be the most beautiful and charming *Cypripedium* introduced, causing quite a sensation at the Drill Hall, on Tuesday, September 26, 1893.

The special feature of this novelty is the dorsal sepal, which is quite distinct in appearance and colour to any other known *Cypripedium*, which will render it exceptionally valuable to the hybridist.

The *Gardeners' Chronicle* says:—"There was a more than usually interesting show of Orchids, but by far the most novel and beautiful exhibit was a plant of *Cypripedium Charlesworthii*, Rolfe, n. sp., First-class Certificate, an entirely new species, imported by Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, and exhibited by them for the first time, the exhibit coming in for a great amount of attention and admiration. The plant in growth somewhat resembles *C. Spicerianum*, and the flowers, which are borne on scapes about 3 inches in height, are unlike any other known species. The beautiful flat, upper sepal is 2½ inches wide, broadly orbicular, white, tinged, and veined over its surface with light rosy-purple; the apex alone showing a white marbling. The lower sepals are about 1 inch broad, greenish-white. The petals, which resemble those of *C. insigne*, are plain-edged, over 1½ inch long, yellowish, tinged with brown; the lip also somewhat resembles that of the *Sylhet* form of *C. insigne*, and is similar in colour to the petals. The staminode is very singular, resembling pure white porcelain, the protuberance in the centre being conical in form, and not a single spur, as in *C. insigne*. It is an extraordinary and beautiful species."

The *Garden* says:—"A First-class Certificate awarded to *Cypripedium Charlesworthii*, Rolfe, a distinct and decidedly novel species, which cannot be compared with any that we can call to mind. The plant is of dwarf habit, the flowers each having a remarkably fine dorsal sepal, extra large, measuring about 2½ inches each way; the colour a pale pink, suffused with purple, and having a lighter network towards the extremities; the petals are shaded with greenish-brown, so also is the pouch, which is rather small. A greater novelty amongst the species of the Slipper family has not been seen for a long time. From Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford."

The *Journal of Horticulture* says:—"A very remarkable introduction from the East Indies; it is a distinct and beautiful species, very dwarf, with long narrow leaves. The flower stem is only 3 to 4 inches long; the lip is short, green, heavily suffused with bronzy-brown, and the dorsal sepal is very noteworthy—it is broad and rounded, and the colouring is a beautiful soft rose, delicately veined; the staminode is pure white. A feature of the leafage are the rows of dots on the reverse side. The species is a great acquisition (First-class Certificate)."

The *Gardening World* says:—"An interesting collection of Orchids was exhibited by Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, including a handsome new species, named *Cypripedium Charlesworthii*, from the East Indies."

IN OFFERING THIS GREAT NOVELTY, WE BEG TO STATE THAT WE ARE
THE SOLE IMPORTERS OF THIS PLANT.

We shall be very pleased to quote size, price, and full particulars.

INSPECTION CORDIALLY INVITED.

CHARLESWORTH, SHUTTLEWORTH & CO.,
WILMER ROAD,
HEATON, BRADFORD.

THE
Gardeners' Chronicle.

SATURDAY, OCTOBER 14, 1893.

TRINITY GROVE.

TRINITY, unlike to Granton and Newhaven, is the residential marine suburb of Edinburgh. The road to Newhaven from Trinity is lined with walled-in residences, embosomed in trees. This close-surrounding of trees, so commonly seen in Edinburgh suburban residences, must be detrimental, one would think, to the health of the owners, for sunlight and free circulation of air, as necessary for human beings as for plants, are excluded by the thick umbrage. Long use has made the residents and their predecessors callous to their gloomy surroundings. Trinity Grove is quite a different place to its neighbours. There is a line of trees along the wall that bounds the pleasure grounds, to act as shelter from the east and north winds, otherwise it is open to every wind that blows, and the sunlight is freely admitted. It was formerly the sea-side residence of Mary, Queen of Scots, and an old vine on the front of the house is said to have been planted by her own fair hands. As the selection of vegetables was very limited in those days, Nettle-tops were considered a great delicacy, and were grown in frames to prolong their season and improve the flavour. At the beginning of this century Trinity Grove was purchased by Ballantyne, the well-known publisher of the time. The title-deeds were signed by Sir Walter Scott, and are still in the hands of the present owner.

Sir Walter was a constant visitor, and used to stay for days together. On one of these visits he is said to have declared himself as the author of *Waverley*. He evidently enjoyed the quiet peaceful seclusion of the old place, with its memories of Mary Stuart, and association with congenial friends.

Entering by the lodge, the house appears as a low two-storied building, having an embayment at one corner, covered with creepers, and with a narrow border, grass-edged, under the wall, filled with bright flowers, from which an old-fashioned Fuchsia with its tiny leaves and flowers protrudes at regular intervals. The grounds here consist of a circular lawn with ornamental trees all round, the trees showing signs of great age. A tree of *Pinus excelsa* has six strong branches, which are growing out from a limb resting on the ground, where they have re-rooted, and then turned upwards, and become much branched. The tree had evidently been checked in its growth when quite young. A Portugal Laurel is quite tree-like, with a thick limb growing out of it; and an old Box tree is supported by six stems coming out of the ground. A magnificent old Poplar near the gate, leaning over at quite

an angle of sixty degrees, must be very ancient, and Queen Mary may often have meditated on affairs of State under the chequered shade of its branches. A *Cupressus macrocarpa* has also a tree-like appearance, going up straight for about 50 feet. In the centre is a round mass of named varieties of *Rhododendron hybridum*.

Yew hedges, as is natural in an old demesne like Trinity Grove, abound, and were planted to conceal the kitchen garden. The main walk, 180 yards by 3 yards, perfectly straight, has this Yew hedge on one side, and is lined the whole distance with standard Hollies, *Rhododendrons*, and Box alternately. Arches are cut in it, affording glimpses of herbaceous borders, and in the centre of the walk standard scarlet and white Thorns, Lilac (white and purple); and copper Beech, have been planted close to the hedge in the kitchen garden. They afford a great contrast of colour, and also act as a shelter to the standard fruit trees. The effect of this long vista of standard shrubs, although rather formal, is imposing, and it harmonises well with the formal lawn that accompanies it the whole distance. Two old wide-spreading Pear trees are a standing protest against all formality; *Veronica salicornoides* formed a round carpet under the first of the standards.

The conservatory, with a range of houses attached, is built out into the middle of the lawn. In front were three triangular beds filled with *Pelargoniums*. In the centre of one of them was an Adam's Needle (*Yucca gloriosa*), which I had the pleasure of seeing in flower. A border of flowers surrounds the conservatory wall. The back row of this border consists of *Salvia patens*, whilst *Gazania splendens* and blue and white *Lobelia* form the front rows. Entering the house, the first thing that catches the eye is a basket filled with Maidenhair in the centre; and an Ivy-leaved *Pelargonium* hanging gracefully down, the soft pink clusters contrasting prettily with the green foliage. The stage all round was very bright with flowering plants, some very large double *Petunias* being very striking. On the roof is a *Lapageria rosea*, and in the centre are *Camellias*. A very effective greenhouse plant is *Pleroma* (*Lasiandra*) *Fontanesiana*, with flowers of a deep purple hue. The Heath-house adjoins the conservatory. A *Dasyliion Hookeri*, flowered in the past summer, throwing up a spike 3 feet high, which bore a panicle of purple-coloured tubular flowers with yellow stamens. *Calanthe Masuca*, an evergreen terrestrial Orchid, was producing when I saw it, a scape of mauve-coloured flowers about 1½ feet high. According to Paxton's *Flower Garden*, this Orchid was introduced by Rollisson in 1842, and has never been figured. In the stove were some fine specimens of *Asparagus prostratus* (plumoseus), and the variety *p. nana*. A curious form of *Odontoglossum grande* was in flower, the labellum having concentric half-rings of light purple. A *Dendrobium suaveolens* yearly throws up from eight to ten flower-spikes, and Mr. Mackenzie has counted 200 flowers on this plant at one time.

The Fernery is also connected with the conservatory. The whole roof is covered with the scarlet pendent racemes of *Pasiflora princeps*; it was the most gorgeous sight I ever saw. This *Pasiflora* is in flower, more or less, all the year. In the winter it flowers on the old wood, and in the summer and autumn on the young wood. Mr. Mackenzie finds that if he keep the house at a temperature of 65°, its flowers do not drop. He also picked a spray with about ten of its scarlet flowers, the apical flowers not expanded, and hung it against a branch of *Asparagus*, than which nothing more effective for decoration could be desired. An enormous basket Fern, *Goniophlebium subauriculatum* (see fig. 72), has fronds 7 feet long, and nearly as many feet in diameter; it cannot be compared in length of fronds to one exhibited at the late show in Edinburgh, which had fronds 12 feet long. *Pleopeltis stigmatica* and *Adiantum amabile* are desirable Ferns for basket-work—at least, the examples in this house seemed to prove it. There is also a large specimen of the *Asparagus prostratus* (plumoseus

cristatus); quite a little plant was certificated by the committee of the Scottish Horticultural Association, the committee not recognising that it is a mere sport. In the Rose-house the roof is covered with *Roses Belle Lyonnaise* and *Niphetos*. This *Niphetos* is as vigorous as a strong *Maréchal Niel*, and produces large globular flowers. The stage is devoted to *Azalea* and greenhouse *Rhododendrons*. Round the brick-support of the house are borders of dwarf *Roses*, and in front are beds of *Ledum canadense* and the Mediterranean Heath.

An oblong border on the other side of the grounds to the house, near the gardeners' cottage, contains many choice shrubs. *Biota occidentalis* and Golden *Retinosporas* alternate at fixed distances the whole way. The fresh, light green of the *Biotas* (many of them have attained to a great thickness) make a striking contrast to the gold of the *Retinosporas*. *Thuia Standishii* has a yellow tint all the year round, unlike the Golden Scotch Fir, which only assumes that hue in the winter. *Cornus mas variegata* is of a different habit to the Variegated *Acer*, one being compact in growth, the other straggly, but they form a contrast. A thick rounded bush of *Berberis Darwinii*, I was told, was quite a sight in the spring, as it was completely draped with its Orange-flowers. Low masses of Ivy, *Pernettyas*, gold and silver Hollies, and *Cupressus macrocarpa*, add to the general effect. A *Pinus excelsa Clanbrasiliana* has a corner to itself. In the centre are bushy evergreen and deciduous trees.

Hedges of Holly and Pivert divide the kitchen garden near the house into plots. Under the hedges by the walks, are old-established herbaceous borders. The hot, dry season had just suited the *Phloxes*, the scarlet varieties literally glowed in the sunlight. The Pink Woodruff formed a pink and green mass. A Yew square forms a rosary; and as they are protected, the dwarf *Roses* were bearing a second crop of bloom. Ulrich Brunner, Merveille de Lyon, Comtesse de Paris, John S. Mill, were the freest flowering autumn *Roses* in this border. In the same plot were rows of tall bushy Cactus and single-flowered *Dahlias* in splendid health. The flowers were of such a great size, and showed so great variation of colours, that I asked Mr. McKenzie if they were new varieties. "No," he answered, "they were here when I came."

The kitchen garden proper has walls on two sides, Yew and Holly hedges form the other two boundaries. By the side of the main walk are standard Apples, and standard Gooseberries alternately. Lord Suffield, Keswick Codlin, Ecklinville and Midlothian Seedling, Apples that never fail to bear heavy crops annually. The Gooseberries and Currants are threaded over in winter with a Royle's Garden Webber, an implement that ought to be more extensively used than it is (see fig. 71 in *Gard. Chron.*, vol. ix., 1891, p. 309), as it does its work in a very short period of time, and saves much time. Heavy crops of tall-growing winter vegetables gave proof of the depth and richness of the soil. The borders are lined with *Polyanthus*, *Auriculae*, and *Pansies*; and in the spring the kitchen garden presents a very gay appearance. Although Mr. Mackenzie has very little assistance, the garden is a pattern of neatness, and everything under his charge shows cultural skill and special knowledge. Gardening seems to run in the family, for his two brothers are gardeners. The eldest was gardener to the late Sir William Siemens, and is now gardener to Lady Siemens. *Vagabond*.

NEW OR NOTEWORTHY PLANTS.

GLADIOLUS PLATYPHYLLUS, Baker, n. sp.*

This fine new tall broad-leaved *Gladiolus* has been imported in a living state by Herr Max Leichtlin from Transkeian Kaffraria, from the same district in

* *Gladiolus platyphyllus*, Baker, n. sp.—Folius brevibus firmulis viridibus late ensiformibus, caulis sequepedali, spica laxa elongata secunda, spathe valva exteriori magna oblonga, perianthio tubo curvato infundibulari. Spatha breviori, limbo tubo aequilongo flavido striis crebris subtilibus rubris percursis, segmentis superioribus oblongis acutis, arcuatis dorso convexis, segmentis inferioribus oblanceolatis reflexa multo minoribus, genitalibus perianthio distincte brevioribus.

which Herbert's long-leaved *Gladiolus oppositiflorus* has recently been re-discovered. In the shape of the flower it resembles *G. dracocephalus* and *G. Quartinianus* (*Bot. Mag.*, t. 6739). The flowers have a yellow ground-work, and fine vertical close red veins. They vary in colour a good deal, the predominant ground hue being between old-gold and ochre-yellow. The leaves are broader than in any other known species, whence the name. Leaves firm, green, broadly ensiform, the lowest reaching a length of a foot above the sheathing base, and a breadth of 2 inches at the middle. Stem stiffly erect, 1½ feet long, bearing four or five leaves, with long sheathing bases. Spike very long, round, varying from half a foot to above a foot in length; outer spathe-valve green, oblong-complicate, 2 inches long in the lower flowers. Perianth-tube arcuate, narrowly funnel-shaped, nearly 2 inches long, ½ inch in diameter at the throat; limb as long as the tube, yellow, with very fine close vertical veins of red; upper segments oblong, acute, ½ to ⅔ inch broad, standing firm, and crowded together, concave on the back; three lower segments much smaller, ob-lanceolate, reflexed, plain yellow at the throat; stamens ½ inch shorter than the upper perianth segments. *J. G. Baker*.

CONIFERS AND TAXADS.

THE brief announcement in these columns of September 30, p. 401, that a systematic review of the genera by Dr. Maxwell T. Masters, has just been published in the *Journal of the Linnean Society*, will scarcely convey to those interested in Conifers, to whom that Journal is not accessible, anything like an adequate idea of its importance, either in its scientific aspect, or as affecting the nomenclature of Conifers in general. It is, as the author informs us, "the outcome of a comparative examination of the morphological characters of all the genera of Taxaceæ and Coniferæ, as far as he has been able to accomplish it. In most cases, living plants have been examined, and in all instances the available museum and herbarium specimens have been studied, and the literature relating to them referred to." How comprehensively and efficiently this has been done, the synopsis itself bears the most ample evidence, and by it our knowledge of this grand family of trees and shrubs is carried to the farthest point yet reached. Thirteen years have elapsed since the publication of Mr. Bentham's revision of the Order in the *Genera Plantarum*, but it was evident from the first to those who had made the Coniferæ a special study, that Bentham's revision, with all its excellencies, and they are many, would eventually fail to satisfy the requirements of science, or the needs of a practical nomenclature. Both requirements are for the time met by Dr. Masters' revision, which will, without doubt, be generally, if not universally, accepted. The lines laid down by Bentham have been mainly followed, but many and important deviations have been made, but always, in the judgment of the writer, in the right direction.

The main object of the present article is to point out where Dr. Masters' systematic arrangement of the Conifers and Taxads differs from that of Bentham, and thence help to prepare the way for the acceptance of some inevitable changes in nomenclature which must result from these deviations, purposely omitting all technicalities and controversial points.

The most noteworthy change is the restoration of Lindley's Taxaceæ as a distinct order from the Coniferæ proper, and which had been reduced to tribal rank both by Parlatore and by Bentham. Dr. Masters distributes the Taxaceæ into two tribes, *Salisburiaee* including the genera *Ginkgo*, *Cephalotaxus*, and *Torreya*, a very natural group, thus restoring *Cephalotaxus* to its proper place from which it had been removed by Bentham and referred to *Taxodinea* (*Taxodium*, *Sequoia*, &c.), with which it has very little in common. The second tribe *Taxineæ* is a far more extensive group, and for scientific purposes is divided into two sub-tribes, of which the Yews proper are the type of the first, with

which are joined the Australian genera *Pherosphaera* and *Phyllocladus*, and the more widely dispersed *Dacrydium*.

The *Podocarpus* furnish the type of the second sub-tribe, and with these are associated the curious *Saxegothæa*, the monotypic *Microcachrys* (probably an oversight of the founder for *Microcauchrys*), and the New Zealand genus *Stachycarpus*, the species of which were previously referred to *Podocarpus*.

Turning to the true Conifers, the first group dealt with is the *Cypreas* tribe (*Cupressineæ*),

by different botanists, most of them on very trivial grounds, is restored almost to its original circumscription; and, although still a polymorphic genus, it is from the broader point of view a fairly natural one. Gardeners and amateurs will thenceforth rejoice that they may continue to call that useful and wonderfully polymorphic tree, popularly known as Lawson's *Cypreas*, *Cupressus Lawsoniana*, its neighbour and near ally, *C. nutkaensis*, and our old friend the white Cedar, *C. thyoides*.

With these, of course, are joined the two Japanese

is restored to its former place, and this inappropriate name, as well as *Chamaecyparis*, will doubtless disappear in time. The second tribe, *Taxodineæ*, remains as it was, except that the monotypic *Glyptostrobus*, which Mr. Bentham had merged in *Taxodium*, is restored; and *Cunninghamia* is removed to the *Araucarineæ*, which tribe also, with this addition, remains as it was. The important tribe *Abietineæ* undergoes no change in extent, but the number of the genera is increased on account of the recent flowering in Europe of *Larix Kämpferi* and *Abies Fortunei*, proving that the first-named is not a true Larch, nor the second a true *Abies*; they are thence restored to generic rank under the names of *Pseudolarix* and *Keteleeria* respectively.

The writer is reluctant to prolong an article already too lengthy, but a word of regret must be uttered on one point, and one only, viz., that the names *Pseudolarix* and *Pseudotsuga* should be retained, when so good an opportunity offered itself for substituting better. There is nothing false about these trees, for they are beautiful realities; the first name was the coinage of a writer on Conifera who seriously believed that *Biota* was derived from *bi*, two, and *otis*, an ear (*sic*, *Pinetum*, p. 49); and the second is a mongrel word, half Greek, half Japanese—a union that philology revolts against. Such names are thorns in the flesh; they bring discredit on the science that takes them up—they are flouted by scholars, and sneered at by the multitude. Dr. Masters' labours among Conifera have been fruitful in many valuable results, and all interested in this wonderful family, will be grateful to him for having undertaken them. A. H. K.

NOTES FROM CHISWICK.

OUT-DOOR GRAPES.—Very probably passed by unobserved by many visitors to Chiswick Gardens are the varieties of Grapes grown on a south-west wall, and generally fruiting well this season, the fruits being ripe, well coloured, and, with some sorts, very sweet. Of course, it would not do to regard the present season as an average one so far as out-door Grapes are concerned, but, at least, these fruit have ripened as well, and the crop has been as abundant, on walls as at any time during the past fifty years. How Grapes have fared at Cardiff, or elsewhere, planted *à la* vineyard, it would be interesting to learn. Certainly, were the wall-grown produce of the season consumed only in the making of wine, sparkling champagne of the best French brands might be abundant, especially with the aid of the big crop of cider Apples which has marked the season. But we may well hope that much of the abundant out-door Grape crop has been put to less ignoble uses than the making of bastard champagne, and that thousands, to whom as a rule Grapes are metaphorically sour, have this year been able to have a fill of sweet, if not very large ones. It is true, that for 6*l.* per lb. we can purchase in town shops good Spanish Grapes in plenty, finer, but not sweeter, than have been grown on our cottage walls. These foreign Grapes, however, seldom get into the rural districts, and the dwellers there naturally find all the more pleasure in gathering and consuming fruit of their own Vines, even though they may not in the markets or shops fetch a higher return than from 2*d.* to 3*d.* per lb. If it be true that good outdoor Grape seasons come but seldom, at least we should not be discouraged any the more from striving to obtain varieties that do offer some advance in prolificacy, in colour, in size of bunch and berry, and especially in sweetness, on those old varieties with which we have so long been familiar. The Vines at Chiswick seem to be capable of furnishing something useful in the direction named, especially the American sorts, which, apparently of some other species than *Vitis vinifera*, have entire leaves of a thick or leathery nature, and comparatively smooth. Some of them are, so far as the flavour of the fruit is concerned, worthless; and yet there are some diverse varieties trained in festoon fashion up columns and along chains close to the

FIG. 72.—GONIOPHLEDIUM SUBAURICULATUM. (SEE P. 456.)

hitherto the most difficult and perplexing to the botanist of all the tribal divisions. Here we have the greatest advance yet made in the systematic arrangement of the included species, numbers of which have been banded about from one genus to another, to the no small inconvenience and, perhaps, disgust of planters. The sub-tribal divisions of this large group need not be specified here, and the Australian and subtropical genera may also be passed over. The *Juniper* remain intact, but in the *Thuia* group some notable changes are made. The genus *Cupressus*, after various dismemberments

species called *Retinospora*; but as it has been oft repeated, *Retinospora* has no claim to generic distinction, and it has, since the introduction of the type species, been made to include a hodge-podge of forms, gathered from three or four different genera. The Japanese *Thuipais* is also brought under *Cupressus*, and perhaps rightly *Thuja* proper is now restricted to the old North American *Arbovitæ*, its big brother on the other side of the continent, the Japanese species, *T. Standishii* or *T. japonica*; and lastly, the Eastern Asiatic species, upon which Endlicher founded the genus *Biota*,

rockwork, which are almost loaded with black clusters of fruit, and present a most ornamental appearance. On the wall near by, however, are some of greater excellence. One of the best is a striking red-berried Grape—a prettier red, perhaps, than is found on any of the Frontignans. This is named Virginus, having medium-sized, handsome clusters of good-sized and perfectly-finished berries, that are very sweet, and it is well worthy of general cultivation. Another excellent deep-red variety is Brighton, the berries fleshy, sweet, and very nice; that, too, is well worth growing largely. Moore's Seedling has good clusters of fine black Grapes, peculiar in flavour, and richly coloured. Of other dark Grapes, Miller's Burgundy has a great crop of very black bunches; Esperione has the largest bunches, the berries well-coloured, but rather acid; Chasselas rose, reddish-black, very sweet and mild flavour, carrying a heavy crop. Gammynoir is also here, but not doing very well; this is a black Grape, and is the chief variety grown in the Castle Coch Vineyard. White's Royal Muscadine has a good crop of fair-sized bunches, quite ripe; Dutch Sweetwater is poorly fruited, it sets badly; Duchess, an American white, strong grower, but not a great cropper; and Jefferson, one of the cut-leaved varieties, the berries carrying some reddish tints. A very striking Vine, for it was not fruiting, is Traburia; it has deep claret-red leafage that is thickly set on the shoots, and should where it does well, make a very valuable addition to hardy climbers giving colour—it does not seem to be a strong grower. All these hardy Vines were originally planted in a heated house, but they were out of their element, and refused to thrive; they evidently like best to be in the open air. *A. D.*

THE HERBACEOUS BORDER.

FREE FLOWERING HERBACEOUS PLANTS.

A FEW plants on the borders here deserve noticing for the freedom with which they are flowering this autumn: these are, *Aster Amellus* bessarabicus, *A. longifolius*, *Anemone japonica*, *A. j. alba*, or *Honorine Joubert*, *Harpalum rigidum*, and *Helianthus multiflorus*, single and double. Some of these generally flower well, but I never remember observing such profusion as this season. Most of them have been in bloom for several weeks, and should the weather keep mild they will last for some time longer. *Honorine Joubert*, the white variety of *Anemone japonica*, does not appear to grow so freely or flower abundantly in some gardens, although here it is remarkably good, and this autumn it has produced a profusion of bloom and is still throwing up flower-stems. Two other plants that do not flower very well some seasons, as they come into flower rather late, are doing so this year, viz., *Aster novæ angliæ* and *Pyrethrum uliginosum*. *J. S. Uper, Wiggan-thorpe, York.*

DICTAMNUS GIGANTEA.

Amongst the many beautiful hardy flowers that have adorned our herbaceous border during the past summer, none have exceeded in interest this charming *Dictamnus*. It is far more attractive than either *Dictamnus albus* or *D. angustifolius*. We first saw this fine *Dictamnus gigantea* in the gardens of Sir Edmund G. Loder, Bart., whose residence then was Flore House, near Weedon, and who had the largest collection of rare hardy herbaceous plants in the district. It was the finest plant in bloom at that time in Sir Edmund's collection, and was a most striking object in the herbaceous border. We searched all our English catalogues for this *Dictamnus*, but in vain, though ultimately found it offered for sale in Messrs. Ant. Rozsens' catalogue of Overveen, Holland. We purchased two plants the following autumn, but they were so small that it required four years' growth before they rewarded us with a sight of their beautiful flowers. They throw up erect stems about 2 ft. high; the leaves are pinnate, with heart-shaped leaves, clothing the stem from the base upwards. The flowers are borne

in long terminal racemes, rosy-red, of surpassing beauty. They will succeed in any deep and fairly rich soil; making handsome plants, and they are exceedingly attractive in the herbaceous-border. *Quintin Read, Hampton, near Evesham.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT "THE BIRKS," ESKBANK, MIDLOTHIAN.

ESKBANK, the residence of George Douglas, Esq., bids fair to become as famed among Orchid growers as it was some years ago among enthusiastic Grape growers, because of the enormous bunches of Trebiano Grape produced there under the careful treatment of Mr. John Curror, the gardener, one of which grown in 1875, and exhibited at the Edinburgh "International" show that autumn, weighed 26 lb. 4 oz., and still bears the "record" as the heaviest bunch known to have been produced in Britain. Although the Vines at The Birks are now much past their best in the two houses devoted to them, the Orchids, which have been steadily growing up alongside of them in two or three houses of moderate dimensions, are now getting into fine specimens in grand health, and flowering to perfection under Mr. Curror's judicious management. Some of the finest specimens have been appearing regularly at the Edinburgh flower shows, and carrying off high honours for some years past. The lot of four which won the 1st prize in a strong class at the recent show at Edinburgh, were specially notable, comprising a grand specimen of *Oncidium incurvum*, with forty long graceful spikes of its beautiful lilac-tinted flowers, computed to have had about 12 000 individual blooms, and measuring through the mass over 7 feet in diameter, a truly grand display. *Miltonia spectabilis* Moreliana, about 2 feet across, and a picture of health, bore about thirty flower scapes, more than half of which were open; *Coleogyne Massangana*, had a couple of dozen of gracefully-drooping spikes of creamy-white flowers; and last, but by no means the least interesting, *Vanda cœrulea*, about 18 inches high, with every leaf in perfect health, and bearing two spikes, with eighteen richly-coloured flowers—quite a gem among Vandas. These formed a splendid group for an autumn show; but the collection at The Birks is, perhaps, stronger in the spring, when the choice collections of *Cattleyas*, *Dendrobiums*, *Lælias*, and the like, are in their full panoply of bloom. Many of the finest varieties of these are grown with great success by Mr. Curror, who, it is needless to say, is a close observer of their habits, likes and dislikes, and he and his worthy employer are alike keen orchidists. *D.*

DENDROBIUM PHALÆNOPSIS SCHRODERIANUM.

This noble introduction of Messrs. F. Sander & Co. was a great favourite from the first, and each year it increases in favour. It is difficult to imagine a more beautiful or more useful flower. At St. Albans there is a fine show of this variety, and that other fine introduction, *Cattleya labiata vera*, which is our best and showiest autumn Orchid. Of *Dendrobium Phalænopsis Schroderianum*, Mr. Jas. Cypher, of the Queen's Road Nursery, sends two charming made-up sprays, in which the flowers are all different, ranging from nesriy white to rose and crimson. Mr. Cypher says of them:—"I am sending made-up sprays of that grand Orchid, *Dendrobium Phalænopsis Schroderianum*, showing over twenty distinct varieties, and at the same time giving an illustration of their splendid effect when properly worked up for ornament. I have now about 2000 blooms open on plants arranged in a span-roofed house 40 feet long. Perfect wreaths of bloom of all shades extend from end to end, some spikes having over twenty fully-expanded flowers."

DENDROBIUM PHALÆNOPSIS STATTERIANUM.

A fine dark crimson form of this comes from Mr. J. Cooper, gardener to John Mills, Esq., Bisterne

Park, Ringwood. The plant is said to have stems 2 feet 4 inches long, four spikes of thirteen flowers each, and it must be a fine object. It is singular that this section produces variations of dark colour only, while the recent importations of the *Schroderianum* type run much into light forms, and seem to promise a fair sprinkling of white ones.

PLANT NOTES.

KALANCHÆ GRANDIFLORA.

THERE are two totally different plants passing current in gardens at the present time under this name. One is *K. grandiflora*, Wright & Arn. *Prodr.*, p. 350, an Indian species with bright yellow flowers, a short corolla tube, and unspotted leaves. This is figured in *Bot. Mag.*, t. 5460, and described by C. B. Clarke in Hooker's *Flora of British India*, vol. ii., p. 415. The other is *K. grandiflora*, A. Rich, *Fl. Abyss.*, vol. i., p. 310, an Abyssinian species, with whitish flowers, a very long corolla tube, and leaves conspicuously spotted with brown. This has lately been introduced into cultivation for the first time, and is figured under the name of *grandiflora* in the *Gartenflora*, tab. 1594. The name *grandiflora* belongs rightfully to the Indian species, and I described the Abyssinian plant not long ago in these columns under the name of *Kalanchœ marmorata*. *J. G. Baker.*

LENGTH OF LIFE IN PHALÆNOPSIS.

In common with most Orchid-growers, I have experienced great difficulty with *Phalænopsis*, and have failed to make them increase year by year, and form large vigorous plants. When speaking the other day to a well-known grower, who has collected Orchids in various parts of the world, he told me that the reason why large and old plants of *Phalænopsis* are hardly ever seen is, because in their own country the duration of their life does not exceed a few years. I should like to know whether this is an acknowledged fact; as if it be so, it throws considerable light upon the cause of the general failure in their cultivation. *S. Courtauld.*

REARING OF CITRUS AND DECIDUOUS TREES FROM SEED.

(Continued from p. 394.)

THE PEARS.—The remarks given on the importation of Apple seedlings apply to Pear seedlings as well. Pear seeds are not so easily obtained as Apple seeds, not because there are not enough Pears produced, but because they are peculiarly liable to prove defective. Seeds gathered from the Winter Nelis Pear have, so far, given the best satisfaction in California.

Growers have reported repeated failures to germinate in Pear seeds obtained from dealers. This is, no doubt, because they are gathered from all sources, care not having been taken to prevent the germinating power of the seeds from becoming destroyed in allowing the fruit to ferment before separating the seeds from the pomace; acetous fermentation takes place, and the germ in the seed is injured by the acid. Another reason is, that the seeds are extracted from unripe fruit, and are necessarily imperfect.

Pear-seeds are injured in many ways, but the principal ones are being kept too moist for a long time, and by allowing them to become too dry. Pear-seeds soon after being collected from the pulp should be separated from each other by mixing with sand. The seeds are taken from the fruit as soon as it becomes quite soft, by sifting them from the pomace, and before becoming dry, or immediately thereafter, are mixed with two or three times their bulk of sand, and are thus kept till spring before being planted. After the first season's growth the plants are taken up and sorted, and then re-planted in the nursery, or the larger ones are grafted indoors, and then transplanted.

PLUM.

The Plum used for stocks can be propagated in two ways—viz., by planting the seed or by cuttings. There are several varieties of Plums that can be used for stocks, but the Myrobalan, or Cherry Plum, has proved the best adapted as a stock for Plums and Prunes. There are other varieties that can be used equally as well, were it not that they put forth numerous suckers, so much so as to render the stock in time valueless. The Myrobalan Plum does not sucker, and thrives in moist soils which are heavy and hold the moisture too long for other stocks, such as the Peach, Apricot, Almond, &c., to thrive. It also thrives in dry soils, but it is best adapted for heavy soils, such as are suitable for the Pear, or in situations which are too wet for other kinds of fruits. However, many have fallen into the error, because this stock is so enduring, of planting it in soils too poor to be altogether suitable for its culture, and on this account the trees have not reached perfection or become profitable bearers. This tree, as do all others, requires the elements and conditions suitable for its culture, but it will endure more hardship, and where the better conditions are supplied its returns are greater.

Plum pits are kept in sand until spring, when they are planted either in seed beds or in drills.

QUINCE.

The Quince is readily propagated, either by planting the seed or cuttings. The latter method is, however, mostly practised, it being accomplished so easily. The seed should never be allowed to get thoroughly dried before it is planted. As soon as taken from the fruit, it should be preserved in moist sand until spring, when it should be planted in a well-prepared seed bed; or it may be sown in drills, as are Pear and Apple seeds.

Quince seeds are not very easily obtained, as the fruit is not grown in such large quantities as the Apple and Pear. The fruit, when obtained, must be cut to extract the core in which the seeds are. They cannot be left to rot, as are Apples and Pears, as decay sets in too slowly; and while many Quinces commence to rot very soon, yet one side generally remains intact, and to wait until that part decays would be too long a time for the seed to remain in the mass of sour and fermented pulp. Propagating by the cuttings system, has so far been the most practised, and almost exclusively. The system of multiplication by cuttings is probably the best for the Quince. The cuttings grow very readily, and make thrifty growth, and can be budded the same year of planting. The cuttings are taken from the trees early in the autumn, and are planted in January or February, or even later, but the sooner they are planted the better, as the Quince puts forth roots quite early.

Large cuttings take root equally as well as the small ones, but the small ones are preferred, as they make a thriftier and healthier stock. Large cuttings have the disadvantage of requiring at least two years of growth for the formation of a complete root-system. Often a large cutting is taken up the winter after planting with the end only partly callused, and the part where rootlets have not begun to form generally dries or rots away, the rootlets then only forming on one side of the cutting. In small cuttings a root forms at the end, and the wound soon grows over; the small root pushes its way downward, and throws out numerous laterals, which give the cutting a system of roots equal to plants grown from seed. The cuttings are made 12 inches long, preference being given to those measuring from a quarter to half an inch thick, and about 12 inches long. They are planted deep, allowing only about 2 inches of the cutting above-ground; and after the soil is well pressed around them, the loose crumb is hoed against the cuttings on either side, covering the parts exposed, to prevent the sun from scorching them, and thereby causing the ends to die back.

When the cuttings put forth shoots, these make their way through the loose soil. It is better to

allow all the shoots to grow undisturbed for a time, as the trimming prevents the development and formation of roots.

Generally, a cutting puts forth several shoots, and in a month or so the most of them seem to stop growing, while one or two take the lead and keep on growing; these are the ones to leave, and which become the stock.

When these shoots are seen to take a start ahead of the rest, the others can be shortened, but should not be cut off entirely, as they aid materially in keeping the sap flowing. If the suckers are removed too soon, this may give the cutting a too-sudden check, and stop its growth for the season. In such event the cutting might as well be pulled up, as it will only remain in the ground lingering between life and death, and, if allowed to grow, will never make a thrifty tree.

WALNUT.

The cultivation of Walnut seedlings is simple, but requires care and attention in all the points bearing on their germination. The nuts are placed in sand, preparatory to planting, as follows:—A frame, consisting of 10 inch boards, is placed on the surface of the ground, and half filled with sand. The nuts are then spread thickly (a layer of nuts 6 inches deep), and covered with about 3 or 4 inches of sand. An embankment of earth is made all round the frame to prevent the nuts from drying. The nuts are examined from time to time, and as soon as they indicate or show signs of germination, are planted in nursery rows. *J. J. Willis, Harpenden.*

FORESTRY.

FORESTRY AT EARL'S COURT.

At the opening of the exhibition in May, though in advance of most other sections, the Forestry Department was in an obviously incomplete state. The preliminary arrangements were not made sufficiently in advance, and the consequence is that, though all praise is due to Mr. George Cadell, the Director, for what he has managed to accomplish, the exhibition has still too fragmentary an appearance. There are lamentable gaps in the collection; and what specimens there are, give, as it happens, rather the impression that for large sound timber we must go to our colonies in the southern hemisphere, and that British trees are chiefly noticeable for their malformations and diseases. The specimens sent by Her Majesty, however, do not contribute to this impression, so far as one section of the kingdom is concerned, for it would be difficult to surpass the beauty of the table-top of Scots Fir, or the vigorously healthy appearance of the planks and logs of the same wood sent by Mr. Michie from Balmoral. Windsor Great Park is characteristically represented by various trees bored by wood-peckers, struck by lightning, and suffering from the development of double leaders. There is a specimen of Herne's Oak and some other finely-grained wood rich in the colour of incipient decay. The antiquity of other trees is evinced by the complete overgrowth of incised dates. It was from this park that the diseased Pine was sent, from which the interesting brood of *Sirex juvenicus*, now shown near by, was hatched; whilst its larger animals are represented by several fine pairs of antlers and the leg of a red-deer caught in the fork of a Thorn tree. Following the strict order of precedence, we pass from Her Majesty's collections to the contribution of the Prime Minister. Interesting, however, as Mr. Gladstone's axe is to many, foresters in general can hardly fail to be more attracted by the specimens sent by one of "Her Majesty's Opposition," Lord Carnarvon's magnificent set of trees from Highclere. They are only four in number, but such a four! There is a well-cut and displayed butt of each, and a good plank. *Picea Menziesii*, 45 years old, contained 80 cubic feet of timber; *Pinus Strobus*, 100 years old, 110 feet; *P.*

Laricio, 60 years old, 111 feet; and the Douglas Fir, 60 years old, 169 feet. We should, however, have first mentioned the series sent by the various Government departments. The Forest of Dean is fairly well represented, specimens even of the fossil trees of its coal measures being included; but a large number of the exhibits are excrescences and cup-shakes, which have a merely pathological interest. The New Forest, on the other hand, is hardly represented at all, nor apparently is the Admiralty, though Woolwich Arsenal sends an interesting gun-carriage wheel and some saddle-trees, showing the various stages of manufacture; and the Small Arms Factory sends gun-stocks of Italian walnut, and lances of Ash and Bamboo. The trustees of the British Museum lend a series of small specimens of woods from Windsor Forest, and the South Kensington Museum sends the historic specimens used by Captain Fowke in his experiments on breaking-strength; but neither of these sets is as well shown as the sixty named Japanese woods, exhibited by the Edinburgh Museum of Science and Art. Most of the Colonial Governments, however, who exhibit, send series that altogether eclipse our own. The Caps colony is mainly represented by some sleepers of various native woods used in the Government railways; and the few small specimens of the magnificent woods of Tasmania at once recall the fine trophy from that island in the Exhibition of 1862, and call attention to the fact that the authorities at Kew, who have so fine a series of colonial woods in their care, have not contributed to this exhibition. There are some very fine planks of New Zealand timbers, besides a large slab of Kauri Pine, lent by Sir Walter Buller; but the most complete collection is that of over one hundred named and described timbers from New South Wales.

The promoters are, we believe, indebted to the Imperial Institute for some of these collections, as also for the block of Douglas Fir squared, over 5 feet in the side. India is, as we have suggested, but poorly represented. Lieutenant-General Michael, one of the pioneers of Indian forestry, sends a fine log of *Padouk-Pterocarpus indicus*; and there is an interesting series of Teak-logs, hollowed by termites, which have been expelled by true ants, and these again by honey-bees. Mr. Cadell himself exhibits a handsome inlaid cabinet of named Japanese and Indian woods.

The railway companies contribute some interesting specimens. The South-Western Railway shows Baltic Redwood sleepers to demonstrate the benefit of creosoting, and some timbers from Ryde Pier, which apparently show that creosote is no protection against the combined attack of sea-water and Teredo. The North-Western Railway exhibit Greenheart, Elm, and Pitch Pine timbers from Holyhead Jetty, where they have been in use for twenty years, and all three, whilst much corroded at the surface, appear equally sound in the main. The Surveyor's Institution exhibit a handsome transparent screen, showing very effectively Burckhardt's series of thin sections of European woods; and Professor Curtis, of Downton, has a small but most instructive series illustrative of rate of growth, recovery from injury, good and bad pruning, Larch canker, &c. Mr. A. C. Forbes, of Bowood, also sends a series of wood and bark showing insect ravages; and we should much like some practical experiences as to the simple tarpaulin tow-lined cap, exhibited by Messrs. Gower, Dodson & Co., as a preventive of insect attack. From an economic point of view, it is disappointing to see only one sample of wood-pulp for paper-making, which is assuredly an industry with a great future. The picturesqueness of the exhibition is enhanced by the shell of one of the Bournemouth Beeches, said to be 700 years old, sent by Mr. J. M. Forbes, the superintendent; whilst the other Corporation woodland, Epping Forest, is represented by a most characteristic pollarded Hornbeam, sent by Mr. F. McKenzie. Nor must we forget Mr. Andrew McAllum's beautiful forest pictures, some from Sherwood, but mostly from Baulham. Throughout

the exhibition Mr. Cadell has carried out, as far as the specimens permit, his excellent ideas on the right way to exhibit timber so as to display all the chief details of its structure. *G. S. Boulger.*

THE GERMINATION OF PALMS.

In the numbers of the *Revue de l'Horticulture Belge* for the present year have appeared some articles by Dr. Henri Micheels on this subject, which, though mainly of botanical interest, are also valuable to the cultivator. On this account we call attention to

FIG. 73.—PHŒNIX DACTYLIFERA.

some of the principal points in Dr. Micheel's paper, which we are enabled to illustrate through the courtesy of our colleagues of the *Revue*. Dr. Micheels begins with the history of his subject, and alludes in glowing terms, as well he may, to the monumental work of Von Martius on Palms.

We may premise that the seed of a Palm is constituted of hard albumen, from which emerges, when the embryo begins to grow, a solitary cotyledon, part of which remains within the seed, whilst part protrudes in the form of a sheath or tube. From within the sheath of the cotyledon emerge in due season the primordial leaves—leaves differing from the adult leaves in form and appearance. These

FIG. 74.—SABAL UMBRACULIFERA.

are the main facts, but they are subject to modifications, as pointed out by Dr. Micheels.

In the Date Palm (fig. 73), the sheathing portion of the cotyledon emerges from the seed in the form of a sheath, which becomes a tube at the base, *G. c.*, and which surrounds the first leaf, *f. g.* *R. p.* is the principal root. *R. p. l.* representing the lateral roots.

In Sabal (fig. 74) there intervenes between the seed, *G.*, and the sheathing base of the cotyledon, *G. c.*, a cylindrical stalk, *C. c.*, *1st f. g.* and *2nd f. g.* being the primordial leaves.

In *Dictyosperma* (fig. 75) the seed is in direct contact with the sheath of the cotyledon, without the intervention of any cylindrical portion.

These three Palms constitute in their mode of germination so many types. Although in some cases there are transitional forms, yet, generally speaking, all the species of a particular genus conform to one of the three types above mentioned.

Dr. Micheels records the names of the various Palms which conform to these several types, for which we must refer to the original paper.

The size of the cotyledonary cylinder varies greatly in different cases, as from 1 cent. in *Ceroxylon andicola*, to 15 cent. in *Corypha umbraculifera*; whilst in *Hyphæne*, *Copernicia*, and *Phytelephas*, according to Karsteo, it exceeds 60 cent.

The first leaf which issues from the sheath of the cotyledon is always represented only by its sheathing portion, and its tip is always stiffly pointed, as in the *Phœnix dactylifera*. In some Palms the second (*Dictyosperma*, &c.) and the third leaves are, as in *Kentia exorhizia*, also represented by sheaths only. Dr. Micheels gives lists of the Palms which produce—one, two, or three primordial sheath-leaves, *f. g.* in the figures.

The first normal leaf (foliage leaf) is characteristic as to the shape of its limb; thus, in some cases it is elongated, entire, and pointed at the tip, as in *Phœnix dactylifera*, and about sixty-five others which are enumerated. The first leaf varies in

FIG. 75.—DICTYOSPERMA AURULUM.

size in different cases, from a few centimètres to as much as 60 centimètres in length, and from 1 cent. in width in Sabal, to 15 in *Pholidocarpus Ihur*.

The limb of the first normal leaf is elongated, entire, and truncate at the apex, which is slightly lobed (*Licuala peltata*, fig. 76).

In *Iriarteæ præmorsa* the limb of the leaf is elliptic, with a shallow notch at the apex.

In many Palms the first leaf is bifid (see fig. 77), as in *Archontophœnix Alexandræ*, or *Hydriastele Wendlandiana* (fig. 78).

The limb of *Caryota* is shortly stalked, ovate, deeply two-lobed, the lobes finely erose at the margins, and with a fine thread in the centre between the lobes representing the midrib (see fig. 79).

In *Desmoncus* sp. the limb also consists of two lanceolate lobes, diverging from a short stalk, and with a central lobe reduced to a filament.

In some cases the first leaf is pinnately lobed (fig. 80), *Calamus Lewisianus*; or palmately-lobed, *Latania Commersoni* (fig. 81).

Lastly, the first leaf is sometimes reduced to the condition of a phyllode, having a sheath and petiole, but destitute of limb, as in *Raphia vinifera* (fig. 82).

Dr. Micheel's paper is an abstract from one which he published in the *Transactions of the Royal Academy of Belgium*, 1889, t. li., and in it are given numerous references to Pâtzer and others who have investigated the subject.

PEACHES AND NECTARINES.

THESE at Mereworth do remarkably on an easterly aspect. There are two walls each measuring 210 yards in length facing the east, both are devoted entirely to the Peach and Nectarine, and in the majority of seasons not only are the crops good, but

FIG. 76.—LICUALA PELTATA, FIRST LEAF.

size, colour, and flavour are equal, if not better than those grown on a south wall. Undoubtedly in the colder parts of the country it would be useless to attempt to ripen Peaches on any aspect except a southerly one, but both soil and climate to suit them, and we are very successful. There are one or two things which the gardener must take into considera-

FIG. 77.—ARCHONTOPHŒNIX ALEXANDRÆ.

tion before making use of east walls, first and foremost is the selection of suitable varieties; next the thin training, and lastly the means of protection during the flowering season. In the selection of varieties to grow, I would advise no late sorts being planted, as it is only in unusually fine seasons that these will ripen, and even then their flavour is not very good; while in the majority of years the fruit is woolly

and dry, and only fit for kitchen use. We have a fine tree of Princess of Wales (probably one of the largest and best under glass), which seldom fails to bear good crops, while the size is enormous, last year several fruits turned the scale at 12 oz. and the largest at 15½ oz. This year the largest turned the scale at 12 oz., and the crop was heavier and better in colour; but still the flavour was not first-rate, although it was much better than in some previous years. Admirable (Walburton's) usually ripen well, and is a delicious Peach; Gladstone is one of the best, Waterloo ripens the first—with Alexander, then

FIG. 78.—HYDRIASTELE WENDLANDIANA, FIR TREE LEAF. (SEE P. 460.)

follow Hale's Early and Rivers' Early York. This year the fruits of the Hale's Early were not so large as usual, but the colour was very fine, and when gathered rather under-ripe and placed in a cool and well-ventilated fruit-room the flavour is quite passable. The Noblesse and Alexandra Noblesse, Royal George, Dymond, and Stirling Castle are excellent in every respect, the first-named showing no signs of

FIG. 79.—CARYOTA SOBOLIFERA, FIRST LEAF. (SEE P. 460.)

mildew here. Condor, Dagmar, A'bec are nice flavoured fruits, and good croppers; Belle Beauce, Royal Charlotte, Grosse Mignonne, Bellegarde, produce excellent fruits on an eastern aspect.

With regard to Nectarines, I find Lord Napier, Elruge, Stanwick Elruge, Pitmaston Orange, Humboldt, Pine-apple, and Violette Hative very satisfactory, colour, size and flavour being all that one can desire in a Nectarine. Victoria and Albert Victor split, and seldom ripen well, but Victoria growing on a south wall has behaved better this year, the fruits being delicious; still, it is a variety that cannot be recommended for a very favourable

position. On our south walls we have Sea Eagle, a noble Peach, although its flavour this season was not up to the mark, which might partly be owing to the drought and heat.

The fruits of advanced Nectarine ripened very early, and were of good flavour and colour, but rather small. If the fruits another season do not attain to a larger size, it will have to be removed to an easterly aspect. It might be well to give a few names of varieties, suitable for an east wall as a guide to planters. The trees, it should be understood, must be strong, healthy, and worked on suitable stocks, and may consist of Waterloo, Hale's Early, Condor, Grosse Mignonne, Alexandra Noblesse, Stirling Castle, Dymond, Goshawk, Walburton's Admirable, and Gladstone Peaches; and Nectarines, Lord Napier, Elruge, Stanwick Elruge, Pitmaston Orange, Pine Apple, and Humboldt. There are several others deserving of room. Peach Falcon at Barham Court, does well, and bears heavily annually; late-ripening varieties should go on to a warmer aspect.

The work of preparing borders should not be delayed, but everything should be got ready for planting, and on heavy land each station should be well-drained in some way; but on moderately light soils, artificial drainage will rarely be required, unless an impervious pan of soil exists, as is often the case, which has to be broken up so that the water may pass freely away. H. Markham, Mertworth Castle, Maidstone.

FIG. 80.—FIRST LEAF OF CALAMUS LEWISIANUS. (SEE P. 460.)

A TRAVELLER'S NOTES.

(Continued from p. 428.)

FUJI-YAMA.—Platycodon round the base of Fuji is as common as Dandelions with us. As I have said, on the east side tons of Rodgersia could be collected; and with respect to Clerodendron, flowering bushes in the shrubberies on hill-sides are not uncommon. It is most handsome. I did not meet with it on Fuji.

Shortly before reaching Yashida we came to some fine groves of Pinus Thunbergi, certainly the best I have seen. The trees were not too close, nearly all from 70 to 80 feet high, with a fine head. Often the stem for 40 to 50 feet had no branches or foliage, and in every instance, at a few yards from the ground, it assumed the well-known brick-red tinge. These groves covered a large area, and were singularly handsome. To their stems clung Ampelopsis Veitchii and Aralia japonica.

Nearer the village a mound was surmounted by a good grove of Retinospora obtusa 50 to 70 feet high, and some Abies brachyphylla. Cryptomeria japonica was also good.

Immediately round Yashida were many fields of Mulberry bushes, cut hard back in the spring, the result naturally being strong young shoots. Sometimes rows of them were planted between Tea, Beans, or Potatoes.

The Mulberry is cultivated for the silk-worm—an immense industry around the whole base of Fuji and in the province of Kosu generally. The silk produced in this district bears the reputation of being heavier than any other in the country.

In the villages, in house after house, women and girls may be seen sitting at this season, winding the silk off the cocoons—a dozen or so of which are in

a small metal pan of water close by. Large flat round baskets of cocoons are spread about the floor as further supplies.

Yashida is a long narrow village, far from a railway—though it possesses a policeman and one jinrickshaw. It is quiet, picturesque, and sleepy, surrounded by glorious scenery—most conspicuous being the great cone of Fuji rising behind it.

From Yashida, mounted on an execrable pony, I skirted the base of the mountain, reaching at evening the village of Hitoana. There was no road,

FIG. 81.—FIRST LEAF OF LATANIA COMMERSONI. (SEE P. 460.)

merely a narrow bye-path over now a grassy plain, now undulating ground, broken by great clumps of Pines, with low hills covered with greenery on either side. Hemerocallis, Enothera, Tiger Lily, Convolvulus, Hypericum, Geranium, Platycodon, Anthericum, Campanulas, and Scabiosa abounded in the wildest profusion.

Near Hitoana we entered a thick forest, chiefly of deciduous Magnolias, Quercus dentata, Maples, Carpinus, &c., often impassable without hatchets, so rank was the vegetation. Thunderstorms, so common round Fuji at this season, were frequent

FIG. 82.—RAPIA VINIFERA, FIRST LEAF. (SEE P. 460.)

during the day; the lightning and thunder were magnificent, and the rain fell in torrents. Not a house or a hut for miles, nothing but the forest, and the rain, and the coolie marching stolidly ahead, and being charged by my pony at every thunder-clap.

Before reaching our destination, the forest ended abruptly, astonishingly abruptly, and we found ourselves on a great plain many miles in extent, with scarcely a dozen trees to be seen. Such a sudden change seemed to me curious, and apparently without cause; the plain is covered with long grass 4 to 5 feet high.

At Hitona there is no inn, so we put up with some priests, one of whom was enjoying his bath on the verandah; the bath was a tall circular tub, over which peeped his shaven head. A large section of the community subsequently entered the bath. A priest came to me, and though he went down on his knees and hands with the most polished courtesy, and begged me to try it, I really could not—being wet through was bad enough. I refused the second ordeal, and fear I deprived the villagers of a looked-for spectacle.

In most villages the roofs of the cottages are neatly thatched, with a layer of earth on the top. In this is frequently a tangled mass of *Iris japonica*; on two occasions I saw the Tiger-Lily. When these are in flower, the effect is curious and pretty.

Round the base of Fuji, in addition to those plants named, Maize and Tobacco are cultivated, and also, as in other parts of Japan, large patches of *Colocasia antiquorum*, for the tubers, which furnish a favourite article of food. Large quarters of *Edgeworthia papyrifera*, the peculiar brownish bark of which is employed in the manufacture of the tough paper peculiar to the far East, I here saw for the first time. From Hitona up to the mountain is but a wood-cutter's bye-way, but hearing the forest on this side was densest, I determined to ascend, at least a short distance.

Leaving the village, we ascended a grassy slope to some 2000 feet. At first a small path could be found, the grass on both sides, rank and coarse, reaching our knees; but, subsequently, the local guide most successfully lost his way, and we wandered about up hill, down dale, and over dry torrent-courses, in strong, tall grass from 5 to 6 feet high, still trying to make the limit of the forest above us. The process was somewhat fatiguing. In three and a half hours we got to a wood-cutter's hut, on the forest limit, and after a rest penetrated some distance up the mountain. The aspect of the vegetation was totally different to that on the Gotemba and Yashidasides. I could scarcely believe a few miles off I had left a mountain slope, covered with *Abies*, with a thick and luxuriant undergrowth. I found myself, from the commencement, in a deciduous forest with trees of immense size, and of great age. Conifers were present, but rare. Fine specimens were numerous; great fallen trunks lay across a pathway, trod by none but a few wood-cutters. There being often little undergrowth, views were obtainable of the dense forest on both sides, rendered more impressive by the complete silence.

I have often noticed the almost entire absence of small birds in Japan; a few sparrows are occasionally met with, but other kinds are very rare. All I saw of Fuji seemed destitute of animal life; we did not even turn up a snake.

I again reached the railway, after leaving Hitona at Suzu-kawa, some twenty miles distant. *En route* I noticed those crops already mentioned, the country bearing much the same general aspect.

The heat is not great in Tokyo; last night at 1.30 A.M., my thermometer registered outside the window, some 40 feet from the ground, 82°. Today, at 11.30 A.M., in the same position, it marks 88°. *James H. Veitch.*

(To be continued.)

VANILLA CULTIVATION IN MEXICO.

THE cultivation, preparation, and trade in Vanilla have occupied a good deal of attention of late, and have been referred to more than once in our columns, so that the following note on Vanilla cultivation in Mexico, from the pages of our interesting contemporary, *The Chemist and Druggist*, will, we doubt not, be read with interest. There are no records (says our contemporary) to show when the cultivation of the Vanilla vine commenced in Mexico, but it must have been some time after the subjugation of the country by the Spaniards; for at the time of the conquest all the Vanilla used appears to have been gathered from wild plants. There is evidence, however, to show that in 1760 *vanillales*, or Vanilla plantations, existed near Papantla, which is still the chief centre of the industry. Six varieties of Vanilla are known in Mexico, namely, the Mansa, the Cimarrona, the Mestizza, the Pompona, the Puerco, and the Mono. Of these, the Mansa is the only one cultivated. The Cimarrona or wild Vanilla has a more pointed leaf, and a thinner stem than the

Mansa; the pod is shorter, rounder, and thinner. The Mestizza has more pointed leaves than the Mansa, but less so than the Cimarrona; the size of the pods is smaller than those of the Mansa, and larger than those of the Cimarrona. This variety is scarce, and when prepared it can hardly be distinguished from the Mansa. The Pompona (*siguezante*, or Banana Vanilla, as the Totonaco Indians, who occasionally eat it, call this variety), has larger and rounder leaves, and a stem one-half thicker than the Mansa; the pod is double the size, and triangular in shape, resembling somewhat a badly-nourished Plantain—it has an extremely pleasant smell, not unlike Anise, and is used in Havanna by the tobacco manufacturers to mix with cigars. The Puerco and Mono, which grow wild, and resemble the Cimarrona, are not used in commerce. There is yet another Vanilla, called the Tarro, or Bamboo Vanilla, which is considered by many as a distinct species, but it is really nothing else than the Mansa grown in the tarvales or Bamboo thickets, in the depths of the virgin forests, where it does not receive a sufficient amount of sun and air, and produces a pod thinner and longer than the ordinary Mansa. Formerly the Vanilla dealers distinguished several varieties and sub-varieties of the article; but at the present time the only grades recognised in commerce are the best class, the Cimarrona or wild Vanilla, and the rezacote or short, damaged, immature, and overcured pods. [One species is now producing its pods in the Economic House, Kew. Ed.]

MANURE FOR FRUIT TREES.

THERE are two methods of manuring, one spreading it on the surface, and the other ploughing or digging it in. As the result of long experience, it is found that much better results are achieved by surface-manuring than by the other method. In fruit trees, especially, this has been found to be the case. The top-dressing should be applied as soon in the spring as the frost is gone, or, at least, in time to get the benefit of the spring rains, which carry the fertilising material a little way beneath the surface of the soil. *Mechan's Monthly for October.*

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By B. WADDS, *Gardener, Birdsall Gardens, York.*

AUTUMN FLOWERS.—As the dark days advance, more attention will be required to keep up a succession of flowers for cutting and decorative purposes. We have in the various beautiful varieties of *Chrysanthemum* one of the most useful of autumn and winter flowers, but they do not please every taste, and a limit has sometimes to be placed on their cultivation, so that other useful plants are not pushed aside for them; and the question is sometimes asked, "Can you find something to take the place of these *Chrysanthemums*? I am tired of seeing these stiff stodgy plants with a few huge flowers; find something that grows in its natural form that I may get flowers from when I want them." This enquiry is to the fore in many gardens at the present time, where not only large blooms, but large numbers of stately specimens that must have house-room for some time, are grown. And another awkward question is where these big plants can be placed till they come into bloom. As a rule, they do not associate well with the usual greenhouse and conservatory plants; but what have we that can take their places during late autumn and early winter, or make so grand a show? Certainly we have the many beautiful varieties of *Primula sinensis*, *P. obconica*, *Erica hymemalis*, *Solanum capsicastrum*, sweet-scented *Pelargoniums*, *Cyclamen persicum*. For the intermediate-house, we have the brilliant *Bouvardias*, *Poinsettias*, *Salvia splendens*, *Cactus*, *Epiphyllum*, the double and single varieties of zonal *Pelargoniums*, the *Polyantha*, *Golden Fairy*, *Mignonette*, and *Perle d'Or* *Roses* come quickly into flower, and are most useful. Then in the stove are *Eucharis amazonica*, *Gardenias*, *Tabernaemontana coronaria*, *Pentas carnea*, *P. rosea*, *Libonia floribunda*, *L. penrhosiensis*, *Linum trigynum*, *Centropo-*

gon Lucyanus, *Eranthemum Andersonii*, *E. pulchellum*, and many others, besides brilliant foliage plants.

CAMELLIAS should now have a good supply of cold water to the roots and abundance of air. The plants are very early this season; some blooms of Lady Hume's Blush, *C. imbricata alba*, and the single white appeared some time since.

LUCULIA GRATISSIMA, if planted out, will need care in watering, as it must not be overwatered at this season, and the drainage of the border should be as good as possible. The same kind of attention is required by *Daphne indica*, which is a plant that is often killed by using a hose in watering.

EUPATORIUM.—The different varieties of these are very useful during the winter months for cutting purposes; they flower as well in pots, as when planted against a wall or pillar. These plants can be well-grown in loam two-thirds, and leaf-soil one-third; plenty of air and water being afforded, and kept clear of aphid.

SOUVENIR DE LA MALMAISON AND OTHER PERPETUAL-FLOWERING CARNATIONS should be fumigated once every three weeks, not waiting till green-fly is seen upon them. Great attention must now be paid to the watering, one application when they do not require it is often death to them. Continue to give air night and day, if flowers are required during the winter months. The earlier plants should be placed in a warmer house by themselves, and helped along with some kind of artificial manure.

THE FLOWER GARDEN.

By T. H. CRASP.

ANEMONE CORONARIA.—The first lot of corms of this plant may now be planted for early blooms on well-drained ground, which, if it be of a light nature, should have a liberal quantity of decayed cow-dung dug into it; but if heavy, leaf-soil or decayed stable-dung manure should be applied. The tubers should be placed at about 2 inches below the surface, and about 4 inches apart each way, which is best performed by throwing out the soil to the required depth. The claws of the corms upwards is the right way to plant them. When the corms are covered with soil, a thick layer of cocoa-nut fibre or half-decayed leaf-mould should be spread over it.

SHIRLEY POPPIES have been very fine with us this year, and the variety of colour exhibited by the flowers, and the softness and clearness of the same make them most desirable plants for the borders and for cutting. They should be taken from the plants in the early morning before they are fully expanded. These Poppies do not transplant well; it is therefore advisable to sow the seeds in a sheltered nook or cold frame, and carefully transplant the seedlings in the spring, better results being thereby obtained than if sowing be deferred till March or April.

BEDDING-PLANTS.—All plants required for stock may now be dug up and potted; and all rooted cuttings placed where they will be wintered. Stock should be taken of cuttings of *Coleus*, *Alternanthera*, *Iresine*, *Heliotrope*, &c.; and if the number is found to be insufficient for the needs of the garden or for propagating from in the spring, some of the plants still in the beds or those kept over in pots from last summer, should be lifted and potted up, cleaned, trimmed, and repotted into sandy peat and loam, and stored in a warm house on shelves close to the light. The 5 or 6-inch pots made use of for this purpose ought to be clean and well-drained, and the ball of earth secured with the plants taken up from the bed should not be larger than is just necessary to hold a fair quantity of roots. A little shade may be necessary for a few days if sunny. *Lobelia erinus*, in its many varieties, is best when propagated by cuttings or division in the spring; therefore, if plants in proportion to needs be lifted with a good ball of soil attached, and planted thinly in shallow boxes or pots in loamy soil placed in a close cold frame, and shaded for a time till they have got over the removal, and then placed on a shelf in a cool dry house, they will furnish plenty of cuttings. Tuberous-rooted *Begonias*, many of which will still be blooming, should now be lifted, and the best-bloomed plants made use of for decoration indoors.

DAHLIAS.—See that the named varieties are provided with labels, on which should be written the name of the plant, its height, and colour of the bloom. Dahlias may be used in the same manner as tuberous Begonias, if they are not too large, and the soil is sufficiently adhesive to allow of a good ball of soil being taken up with the roots. Some of the white varieties lift with fairly good results, and they are very useful in the greenhouse till the *Chrysanthemums*, &c., become more abundant.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

PRUNING APPLE AND PEAR TREES.—Make every effort to carry out this important operation at the earliest possible date, as, apart from the discomfort attending the work if left till the winter, it is better for the trees, and the work can be more efficiently done before the leaves (which are a guide for the proper thinning of the branches) are all off the trees. Pear trees being the first to shed their leaves, should be taken in hand first, and where summer-pruning received proper attention, little will now be required beyond thinning out well all weak branches in trees which have become too dense, and shortening back the leading growths. It is no uncommon thing to see pyramid Pear trees where the branches have been allowed to grow much too long, and consequently under a crop of fruit they are either bent down very much, or much labour is required in propping them up. Such trees should now have all the branches shortened back to such a length as will be capable of supporting a crop of fruit. On large branches, which may require a pruning-saw, the cut should be smoothed over with a sharp knife, and it will then quickly heal. Apples should be treated similarly, such dense-growing sorts as Cox's Pomona, Waltham Abbey Seedling, Gascoigne's Seedling, The Queen, Lane's Prince Albert, &c., need special attention in thinning the branches. The inside fruit from such sorts, if the trees are left in their natural dense state, lacks firmness of flesh, and consequently does not keep so well as that produced nearer the extremities of the branches. The mulching which I advised early in the season should be placed over the roots, may be left until the pruning is finished, which in the event of wet weather will prevent the soil from sticking to the boots. It should then be cleared off and the ground left tidy for the winter.

STRAWBERRIES.—All except the newly-made plantations should receive copious supplies of liquid manure, which, after the recent rains, will be easily obtained, and especially where provision is made for catching the drainings from dung-yards, hot-beds, &c. This practice is more commendable than the common one of applying a heavy dressing of manure between the rows, which, besides providing shelter for slugs, also deprives the ground of the sweetening and other beneficial effects to be obtained from its exposure to frost.

ARREARS OF WORK, ETC.—Any work of root-pruning, lifting, and replanting of Apricot, Peach, and Nectarine trees, or transplanting trees, as advised in recent calendars, should be completed as early as possible. Trees to be obtained from the nursery should be ordered at once, and when this is done, prefer the request that they be forwarded so soon as the lifting of trees commence. When it is convenient to do so, it is advisable to visit the nursery and select your own trees, selecting only such as seem to be on suitable stocks, which is best indicated when the head does not overgrow the stock, and *vice versa*.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Tinperley.

MASDEVALLIAS.—The Chimera section of Masdevallias which were grown in the cooler *Odontoglossum*-house up to the present time, will be best accommodated for the future in warmer quarters, it not being safe to leave them any longer where they are. The *Cattleya*-house forms a suitable place for them, or better still, the *Miltonia* *vexillaria* house, there being more genial moisture there. The watering of Masdevallias needs much carefulness, and it is better to afford just as much and no more as will keep the moss healthy and growing, more than this would probably cause "spot." Masdevallia *Tovarensis* is another species that should

be placed with the above, and watered as carefully, too much water causing loss of leaves. This last species is with us showing the new flower-spikes, and buds are issuing from the old spikes. The small species of shell-soils devour the new spikes and buds, and must be caught. *Miltonia* *vexillaria* should now be in active growth if the plants were potted when advised. The air of the house should be moist, dryness soon causing thrips to appear, which disfigure the leaves, and render the plants unhealthy, and getting into the new growths, are not easily dislodged. *Odontoglossums*, *Miltonias*, and *Phalaenopsis*, after this date, should be placed at the cool part of the stove, or where the warmth is not less at night than 60°. *Odontoglossums* and *Miltonia* *Rozii* winter well in such a house. Before removing the plants, free them from yellow thrips, which are insects that increase fast in a dry and warm atmosphere; all parts just round about these plants should be well damped once or twice a day, and the plants themselves be dewed over on fine days. The *Miltonia* *vexillaria*-house is a suitable place to put the following plants in during the winter, but they may be grown in the summer in any house that can be kept cool, viz., *Dendrobium* *Jamesianum*, *D. infundibulum*, *Odontoglossum grande*, *O. Inseayii*, *O. Kramerii*, *O. navium majus*, *O. blandum*, *O. nebulosum*, *O. Gerstedii*, *O. cirrhosum*, *O. Pescatorei*, *Ada aurantiaca*, *Cymbidium eburneum*, *Pilumna fragrans*, *P. nobilis*, *Rastrepia antennifera*, *R. Dayana*, *R. maculata*, *Sophronites grandiflora*, *S. cernua*, *S. violacea*, *Trichopilia coccinea*, *T. suavis*, *T. tortilis*, *Laelia Dayana*, *L. praestans*, and *L. marginata*. The *Laelias*, which should now be in flower, come in at a time when other flowers are getting scarce. Plants of *Dendrobium formosum giganteum*, *D. Phalaenopsis*, *D. P. Schroderiana*, and *D. bigibbum*, are now making a grand show.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

PINES.—It is a practice, not uncommon at this season, to generally arrange all Pines into batches according to their different stages of growth, that there be little work among them during the short days, except to supply the necessary moisture, heat, and air. Any showing fruits are placed first, and then successions to come into fruit after the turn of the year, and afterwards those which are to show fruit in spring and onwards, and if young plants have well filled their pots with roots, they should be potted, in order to prevent them becoming pot-bound. If any potting has to be done now, and the soil is of a close, heavy texture, it is well to mix a little sand through it, with a liberal addition of charcoal. Good drainage is of great moment, and it is not desirable to mix manure of any sort with the soil at this season, except it be a small portion of soot, which, if dusted over the moss or fibre from turf put over the crocks, will prevent the ingress of worms. Where leaves are used to retain bottom-heat, it is well to put them in a heap, and kept carefully turned till they are at the stage of heat desired. Newly-fallen autumn leaves are often used, but in such cases they should not be from Lime trees, or any such soft foliage, which heat quickly, and soon sink again. Oak and Beech maintain the most even and lasting temperature. Where good tan can be had it costs less labour than leaves. It should be rather dry before being added to the beds, and not allowed to heat violently. If stable manure is depended on for surface-heat by means of linings, it may be mixed with good leaves, and allowed to become warm before it is used. The manure is more lasting when a good portion of leaves are added to it. The temperature of plants swelling fruit may be allowed to fall during cold weather between 65° and 75° in absence of sun, and this is a safe temperature in mild weather. For young, newly-rooted plants, a temperature of from 60° to 65° need not be exceeded, except during sun or mild weather. But a rise of 10° or 15° for a few hours in the afternoon, by means of sun, is helpful to growth, and a little air admitted daily assists materially to keep the plants firm, and the growth healthy; 75° to 80° is enough for bottom-heat for all growing stock during winter, but the fruiters may have 5° or 7° more. To give flavour to fruit, the roots should be kept rather dry, and warm dry air should circulate among the plants. Syringing is little practised during late autumn and winter, and may only be done when fire-heat is regular in use.

CHERRIES.—The trees for supplying early Cherries should now be resting, and if they are in pots

the drainage should be examined, inert surfaces of soil removed, and replaced with good turfy loam, in which some suitable artificial manure is mixed, and all useless wood and worn-out spurs should be removed with a sharp knife. The trees should be kept from heavy rain. Trees planted out in the houses should be kept as cool and dry as possible. Those which may be inclined to grow gross may be lifted and replanted firmly in good loam, and some lime rubbish mixed with it. Trees in pots to supply fruit by means of glass protection only, should remain plugged behind a hedge under complete rest.

CUCUMBERS.—Plants for supplying fruit during winter, which have been recently planted out, and now having rooted well into the new soil, should be allowed to grow slowly with plenty of light and air admitted. They should be kept thin, and any blossoms be taken off till the plants are well-established; bottom-heat need not exceed 75° to 80°. Established plants should now be fruited lightly.

MELONS.—Plants which are ripening fruits should be kept moderately dry at roots and atmosphere, with a free circulation of warm dry air. Keep laterals thin, and give no liquid manure.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Busted Park, Uckfield.

STORING ROOTS.—Though late in completing their growth this season, most kinds of roots will at about this date be ready for lifting. The secret in keeping such vegetables in a fresh tender state, is to prevent the waste of their juices in making untimely growth. Carrots should be taken up, like all other roots, in dry weather, and laid on the ground for a few hours to dry, so that the soil adhering to them may be easily rubbed off; they may then be placed in a cool, dry, frost-proof cellar. If the place in which Carrots are kept be not cool, growth soon commences. Parsnips may be allowed to remain in the ground a while longer, though a few roots should be taken up when the weather is fine if they are needed thus early in the season, but the Parsnip is a winter vegetable which is best flavoured after frost has touched it. Beetroot, being more tender, should be stored similarly to Carrots, care being taken not to break the roots nor to cut off the top too short, so as to cause loss of juices. Scorzonera and Salsify may be taken up late in the month, storing them, like Carrots, in partially dry sand, &c.

SPINACH.—Late sowings are making rapid progress since the rain, as also are the weeds, and hand weeding must be resorted to if the land be too wet for hoeing. If crowding of the plants is feared, some amount of thinning-out will be necessary.

ASPARAGUS.—A gentle hot-bed may be made up for forcing Asparagus. When it has attained its maximum degree of warmth, and has declined to about 85°, the roots should be lifted, and, without allowing them to get dry, packed pretty close together on a 6-inch layer of leaf-mould laid on the surface of the bed, which should previously have been turned over, and levelled, and brought up to within 1 foot of the glass, by the addition of warm tree leaves, from the fermenting heap. As the placing of the roots take place, leaf-mould, or some light soil should be tucked in firmly about them, and thorough watering afforded, with the water at not less than 90°. The crowns should be very carefully removed from the beds or lines in the open ground, by opening a trench 2 feet deep, and undermining them with a steel fork, being as saving of the roots as possible, as their loss means poor return in shoots.

CELERY.—The plants should be earthed as fast as they require it when the soil is in a moderately dry condition. Mould up the plants first by the hand or a trowel, or tie them up with matting so that no soil gets into the hearts. Matting or cord used for tying should always be removed when the earthing-up operation is finished. Celery intended to stand the winter, should have at least 18 inches of earth put on each side to exclude frost—but of that more anon.

POTATOS.—Where young tubers are required at a very early date, some of the most forward sets of Ashleaf may be started in a warm light situation, but as this variety does not grow regularly, the most promising tubers should be selected for early planting.

EDITORIAL NOTICES.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.

Plants, Fruits, &c., to be Named.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—50°·1.

The following letter from Messrs. SUTTON, of Reading, requires no preface, and the importance of the subject, no explanation. We hope to have other opportunities of alluding to the matter, but in the meantime confine ourselves to the publication of Messrs. SUTTONS' letter:—

"The crosses made ten years ago proved not to have been made with the true *Solanum Maglia*, but with a form of *Solanum tuberosum* growing for many years at Kew, and supplied by them to

Lord CATHCART, and the large batch of seedlings you saw nine years ago lost much of their interest. We were determined, however, not to be beaten, and having brought from Kew the true *Solanum Maglia*, set to work to get hybrids from it.

"In 1887, at least 1000 crosses were made, using the pollen from the true *Solanum Maglia* upon a cultivated Potato, but the only result was three grains of seed, only two of which proved fertile. These two seeds produced two plants, one much like the *Maglia* parent in every respect, but with weaker foliage, and small tubers. The second was so delicate, that for three years we had to keep it under glass, but last year and this, having planted it in the open, it has taken a new lease of life, and produced remarkably fine tubers, larger and handsomer than those of many cultivated varieties. Hybrid No. 1 remains much as it was the first year; but taking pollen from it, we have two series of crosses with the cultivated varieties, which, though resembling the *S. Maglia* in some respects, give extraordinary promise of new commercial varieties, being more prolific than some of the best English forms alongside."

Gardeners, Past and Present.

It is no uncommon thing to hear the older men in the profession lamenting the degeneracy of the present race of head gardeners, railing at them for their assumed shortcomings, and making unfavourable comparisons between them and their forefathers, a somewhat profitless occupation, and one that can in no way help to make matters other, or better, than they are. That there were giants in those days, will be conceded by every one of us old enough to remember the grand old men who exhibited plants and fruits at the few horticultural exhibitions of that period, notably at the Horticultural Society of London, now the Royal Horticultural Society of Great Britain. Gardeners, in most points, as good as they, but who have not to act the part of pioneers and discoverers in cultivation—that part of the business having in great part been already done for them by those earlier practitioners—are to be found not in twos and threes, but in scores all over the country, and their productions are to be seen, not only at the Royal Horticultural Society's shows, but at all the best shows in the provinces, and these must number fifty, as against one, half a century ago.

The general average of horticultural excellence of to-day is higher than formerly, and it is in constant increase, thanks to a more general diffusion of knowledge by means of the gardening press, the numerous works on gardening in general, and special treatises. The young men and boys who enter the profession are better equipped for assimilating that which is taught them, or which comes under their observation. Speaking from experience, we think the younger men are deficient in the management of plants that pertain to out-of-door gardening—a department the gardeners of long ago were far better versed in.

A few of the more important matters in this part of private gardening may be mentioned here. A satisfactory acquaintance with the culture of outdoor fruits, especially stone fruits on walls, which, owing to the persistence with which horticultural builders and cultivators in general have recommended glass-house protection for Peaches, Nectarines, Cherries, &c., has fallen into the background as a subject of great importance. But we know that the generality of our summers are sufficiently warm to ripen on walls, south, east, or west, all of our varieties of Peaches except the very latest, and a comparison of the cost of management under each method of culture is certainly in favour of the walls; and

provided a proper selection of early, mid-season, and late varieties be made, the season during which fruit can be enjoyed is longer than from trees under glass protection.

In the matter of kitchen-garden management we have not, perhaps, retrograded; but then we have advantages and aids that did not at that time exist. These consist of the large number of artificial manures now made, from which the sort best adapted for certain classes of soils and the needs of certain kinds of vegetable can always be chosen, provided the gardener has the ability to decide. Then the plan of furnishing gardens with a system of pipes for the distribution of water is now very general; and the duty having long been taken off glass, frames, hand-lights, cloches, ground-vineries, Paxton-houses, and a host of other contrivances of which glass forms the chief portion, have now come into use in the kitchen and forcing garden.

The various kinds of vegetables in use in British gardens have been much improved in size, if not in variety, flavour, or beauty. We have only to instance Peas, Runner Beans, Cabbage Lettuce, Spinach, Potatos, Tomatos, Cucumbers, Cauliflowers, and to a slight extent Broccoli, French Beans, Cos Lettuce, Melons, Rhubarb. Some of these enable the gardener to lengthen the season at which vegetables are obtainable without forgoing at the commencement and at the end. Potatos have greatly gained in cropping qualities and in form, if not in flavour. The Ash-leaf Kidney and the Lapstone amongst early and mid-season kidneys, and the Regent amongst rounds, have not been excelled for table qualities; but the food of the nation has been enormously increased by the introduction of new varieties at home and from America.

In Grapes the general excellence has risen, but we have still to learn how shanking is to be avoided. We are not much better instructed in the proper manner of making a Vine-border than formerly, although the consensus of opinion as to depth is in favour of shallowness, and as to materials, of but few. We have discarded the carcasses of dead animals as affording proper manure for the Vine-border, preferring wholesomer plant-food, good drainage, and plenty of water when the Vines are growing; and the old belief in the benefit of depriving Vines and other fruits of root-moisture during the winter is losing its hold of the better cultivators.

Hardy trees and shrubs, especially deciduous shrubs of much value in gardens for their flowers, need special attention from gardeners. Generally the right methods of pruning them, and how to put them to the best use in decorating a garden, do not receive the fullest attention. They are too often looked upon as being good enough to form a shrubbery, which in most cases is employed to shut out undesirable objects—a rough, untrimmed hedge, in fact, crowded together at top, and as a consequence starved at the root.

Another common, we think, almost barbarous mode of employing shrubs of this kind, is to plant at rather wide distances apart, yet not sufficiently wide for full development, and then trim them into formal shapes annually, before the time at which they usually flower, and dig deeply around and close up to them so as to weaken the plants by cutting off most of the surface. This, by the way, is much practised in some of the London parks. Now, a knowledge of the capabilities of shrubs as beautiful objects in the garden, and how these can best be brought out, is very much required by the young gardener of to-day; and it is one that was once much better understood, and one of the reasons for the former preference

VIEW IN THE CONSERVATORY, BOTANIC GARDEN, MANCHESTER.

for the Scotchman as gardener was his fuller and more complete training in out-of-doors gardening. If employers would show greater appreciation for the cheap, natural beauty of out-of-door shrubs and trees, we should soon see improvements in this department.

We hear much from old men of the glories of the old Chiswick shows—the grand Cactuses from Cheam which GREEN used to bring, the New Holland plants, the Pelargoniums, the fine Fuchsias; but what are these beside, let us say, for example, the glorious Oroids, the magnificent Palms, pot-grown Roses, the immense array of zonal, tricolor, fancy, show, and decorative Pelargoniums; the numerous varieties of Narcissus, *Hippeastrum*, *Cliveia*, *Gladiolus*, *Delphinium*, *Primula*, *Cineraria*, *Gaillardia*, *Pyrethrum*, *Chrysanthemum*, and greenhouse *Rhododendrons* of to-day? These are mostly the productions of the present, and gardeners may well be proud of them; only we do assert that whilst they have been doing all this, and adding immensely to the number of the inmates of the glass-house and the flower-border, they have not given much thought to cultivation of hardy plants. Perhaps it is too much to expect of them, especially as they have to take cognizance of much more than we have touched upon, viz., the foliage plants of the stove and greenhouse, and the multiplicity of tender plants still used in summer bedding.

Can it be said that gardeners have retrograded in matters of cultivation? Those who retain a fondness for certain species of plants, once cultivated very generally in gardens, but whose cultivation is now much less understood, or at least practiced, will say that it has done so; but have we any right to say that, because gardeners do not grow this, that, or the other plant, they could not do so if the fashion set in again in their direction?—we think not. There will always be found gardeners who would not let drop the cultivation of *Ericas*, *Boronias*, *Hakeas*, *Tremandra*, and New Holland plants generally, that have pretty flowers; or of *Azalea indica*, or of the Pine-apple, because we can get fair fruit from Teneriffe or the West Indies. It is a case of like employer like gardener. Let but the gentleman or lady owning a garden desire this or that attainment in a gardener, or to have banished formality and inelegance from the garden, and well-kept borders and beds of the beautiful hardy herbaceous perennials in place of the usual tender exotics; or enjoyable effects obtained by simple means at small cost; or plenty of hardy fruits on trees out-of-doors, and well-kept orchards; the men who can perform these things in a reasonably satisfactory manner will be forthcoming; but, as a rule, the employer should be ahead of the gardener in the knowledge of the appropriate, the æsthetic, and the beautiful, and, as it were, fix a standard of excellence to which the latter may aspire.

MANCHESTER ROYAL BOTANICAL GARDENS.

—(See Supplementary Illustration.) Whatever Mr. BAUCK FINDLAY, the genial and clever Curator of the Manchester Botanical Gardens, does, he does thoroughly and well, and those who can call to mind the plant department of the early days of his curatorship, and the superb and well-arranged collections found there at the present day, will not fail to wonder how such great and radical changes could have taken place whilst the various departments of these beautiful gardens were not only kept going, but were actually being improved at every point. The flower-show fixtures, too—which, while constituting a great aid to horticulture and adding to the fame of the gardens, are certainly an element detrimental to the permanent establishment—have under

the guidance of Mr. FINDLAY, also steadily improved, until now they are of the best and most useful in Europe. The fact is, Mr. FINDLAY is a thoughtful worker, who, when a big undertaking is in hand, has everything carried out to a previously-arranged plan, and the difficulties having been seen and provided for, the rest of the gardens do not suffer. Every part of the gardens is kept as neat and orderly as the best private establishment could be, and floriculture and botanical subjects are well represented. At different times we have seen houses filled with well-grown Chinese Primulas, Cyclamens, Pelargoniums, Chrysanthemums, Bouvardias, and other florists' flowers cultivated up to market quality, while at every point in the lofty conservatory and Palm-houses such views as that given on our supplementary sheet meet the eye; the central portion of the Palm-houses being occupied by some magnificent specimens of *Seaforthia* and other Palms and Tree Ferns, which rear their graceful foliage to the highest point, and present together a truly tropical scene. The Fern rockery is also a noble piece of work, and the manner in which it has been planted renders it one of the most beautiful arrangements of its kind in the country. In the Orchid-houses, although a general collection of Orchids is not to be found, there are always interesting plants in bloom. Whenever one may, the gardens are always nice, and their amiable Curator ready to give information in his own easy pleasant manner.

INTERNATIONAL EXHIBITION AT LYONS.—It has been arranged to hold a universal, international, and colonial exhibition at Lyons, in 1894, and to include a section devoted to horticulture. There will be a permanent horticultural exhibition open from April to October, divided into sections, including exhibits relating to all branches of horticulture, arboriculture, and market gardening, as well as various temporary "concours," which are to be held every month, and to last for a week. The several classes are open to anyone employed or interested in plant-culture, amateurs as well as professional florists, fruit-growers, market-gardeners, &c. All countries are invited to exhibit. The exhibition is under the direction of M. Faure the President, M. Gérard, Vice-President, and M. Ant. Rivoire, Secretary. Applications for space in the horticultural section should be directed to M. J. Claret, Palais Saint Pierre, and other communications to the Conseil Supérieur de l'Exposition, Lyons.

THE ROYAL GARDENERS' ORPHAN FUND.

Intending subscribers are respectfully reminded that the collecting cards recently issued amongst the gardeners and general nursery trade throughout the country, should be returned during the next month. It may be again stated that every 5s. collected will secure a vote for the next election, and every £5 a vote for life. It is earnestly hoped that a very liberal response may be made to this appeal in order to meet the requirements of the present year. Collecting cards may still be obtained on application to the Hon. Secretary, or any member of the committee. *A. F. Barron, Hon. Sec., Chiswick.*

— An evening concert will be given at the Assembly Rooms, Sarbiton, on Wednesday evening, October 25, in aid of the Royal Gardeners' Orphan Fund. Concert to commence at 8 P.M.

CHRYSANTHEMUMS IN THE PARKS.—The exhibition of Chrysanthemums by the London County Council will be opened to the public in the Frame Ground of Battersea Park on Saturday, October 14. The Superintendent states that the show will be much better in a week's time, but by opening on the 14th, an extra Sunday will be given, and the public allowed to see the show from its commencement.

"BOTANICAL MAGAZINE."—The plants figured in the October number are *Rhododendron Falconeri* var. *eximia*, t. 7317. A pink-flowered variety of this noble species, one of the hardiest of the Sikkim species.

Dolichos simplicifolia, t. 7318.—A very curious tropical African species, with large fleshy rootstocks, from which proceed long slender branches bearing narrow lanceolate leaves, representing the terminal leaflets of a compound leaf, but of which the side leaves are not developed. The Pea-shaped flowers are shortly stalked, and borne in clusters in the axils of the leaves. The plant is a native of tropical Africa. Kew.

Cypripedium montanum, t. 7319.—A Californian species, differing from *C. pubescens* mainly in having a white, not a yellow lip. Hort. ELWES.

Tillandsia microxiphion, t. 7320.—A new species from Monte Video, differing from *T. stricta* mainly in its shorter leaves. The leaves are linear, the flowers blue. It was discovered and introduced by M. ED. ANDRÉ.

Phalenopsis tetraspis, t. 7321.—Closely allied to *P. speciosa*, but differing in the lobes and appendages of the lip. Flowers white.

DENDROBIUM.—Mr. H. J. GOEMANS has republished, from the *Revue de l'Horticulture Belge*, his synopsis of the cultivated species of *Dendrobium*. The species are arranged alphabetically. No descriptions are given, but indications of the native country, altitude, date of introduction, period of flowering, requisite cultural details, and other particulars are given in the form of a systematic table, which will be of value to growers. It may be had of M. AD. HOSSE, Ghent.

EARLY FLOWERS.—On October 3 we saw in bloom in the establishment of ED. PYNÆERT VAN GEERT, many plants showing the effect of the exceptionally high temperature of the past summer. We may mention *Azalea mollis*, *A. indica*, *A. ponticum*, a *Rhododendron*, *Berberis stenophylla*, and *Viburnum Tinus*, many of which last were just coming into bloom; *Andromeda*, and—in the houses—*Camellias* during the last fortnight.

A SECOND STRAWBERRY HARVEST.—Numerous baskets of Strawberries have been shown since the end of September by the fruiterers of Liège. These Strawberries, which fetched from two to two-and-a-half francs per basket, are produced in the neighbourhood, and are the second crop of the season. They have less flavour and excellence than those gathered in the summer.

GRANTS FOR AGRICULTURAL AND HORTICULTURAL EDUCATION.

—The Report of the Board of Agriculture on the administration of the Parliamentary grant in aid of agricultural and horticultural education in Great Britain during the financial year ending March 31, 1893, has been issued, and shows that the sum distributed to the thirty-four colleges, schools, institutions, or societies established in the country amounted in the past year to £7425. This sum contrasts with £6705 in 1892, with £4840 in 1891, and with £4585 in 1890. As in previous years, the grants have been applied to aid in the provision of the scientific and practical training essential for the higher teaching of agriculture, while endeavours were also made to facilitate on a wider scale the acquisition of more elementary agricultural knowledge by rural schoolmasters and lecturers now largely engaged in the local work of technical education. The technical training both of pupils and of actual workers in single branches, such as dairying, forestry, and fruit-growing, has been again aided, and the outlay both of societies and teaching institutions, on the provision of centres of illustrative experiments has again demanded no inconsiderable share of the grants.

THE BEGONIA.—If this is now becoming a somewhat hackneyed theme, at least it did not lack charm and interest in the hands of Mr. JAMES MARTIN, the Messrs. SUTTON & SON'S able Begonia grower and nursery foreman at Reading, who gave to the members of the Kingdon Gardeners' Association on the 3rd inst. a delightful address, illustrating it with the aid of numerous plants representing species and varieties that had been employed for cross-breeding, leading down to the production

of the present fine Reading strains. A very hearty vote of thanks both to the Messrs. SUTTON & SONS and to Mr. MARTIN was awarded. The President, J. P. TREV, Esq., of Surbiton, occupied the chair, and there was a large attendance.

ALLOTMENTS AT KINGSTON-ON-THAMES.—The Corporation of this town having recently received a very largely-signed memorial in favour of the provision of allotments, at its last meeting agreed to purchase 11 acres of ground within the borough boundary, a small portion of which is to be used for the erection of an isolation hospital, and the remainder for allotments. It is possible that the contiguity of the hospital may at the first prove a deterrent, but after those who desire allotments get over their alarm and realise that science can make the contiguity of such a hospital comparatively innocuous, that the plots will be at once taken up. It is now a capital time to make the provision, so that the allotments may be entered upon at the beginning of the new year.

WINE MAKING IN AMERICA.—We learn from *Meehan's Monthly* for October, that Mr. ELWOOD JOHNSON, of Germantown, Philadelphia, has a bottle of wine made in 1760, from American species of Grapes, which is probably the oldest sample of native wine in America. The Frost Grape was probably used.

"ORCHID REVIEW."—The October number of this publication opens with an allusion to *Cypripedium Charlesworthii*, which was figured in our last issue, p. 437. The history of Orchid hybridization is continued, and an account of the origin of *Cypripedium* × *vexillarium*, C. × *Arthurianum* is given, together with a considerable amount of *Cypripedium* lore of a miscellaneous character.

"LINDENIA."—The September number of the above, now before us, contains:—

Cymbidium grandiflorum, Griff., var. *punctatum*.—A native of the Himalayas, where it is found at heights between 5000 and 7500 feet. The leaves, which reach a length of 2 feet, are acute, and 1 inch to 1½ inch broad, and strongly striped with pale and bright green along their sheathing base. Flowers, seven to twelve, on a stout more or less drooping scape, measuring from 5 to 7 inches across in some forms. Petals and sepals are spreading, oblong, and acute, uniformly pale green in the type, but dotted near their base in *punctatum* with dark purple. The somewhat villose lip is tinged with pale yellow usually, but in the variety it is of a brighter tint, and spotted with purple; the front lobe almost rounded, wavy, and lobulate at the margin. The disc bears two long longitudinal hairy plates, extending from the base nearly to the base of the front lobe.

Odontoglossum Triomphe de Rambouillet, Hort.—A superb form of natural hybrids allied to *O. crispum*. Its segments resemble those of *O. Ruckerianum*, and it has the same rosy hue, which is particularly bright on the borders of the sepals and petals. Large purple blotches on the ground colour give distinctiveness to the bloom.

Galeandra Claesii.—This species has very slender pseudobulbs, 10 to 18 inches long, cylindrical, hardly fusiform, with inflated knots at short distances apart, not inflated, pale bluish-green at first, then deep green. Leaves bluish-green, five to seven in number. Inflorescence 9 inches long, the upper part drooping; sepals and petals vinous purple; lip vinous purple towards the extremity, then paler, passing to yellowish-green at the spur.

Cymbidium Lowianum var. *superbissimum*, which differs from the type in having a much brighter front lobe of the lip, which is coppery purple-red, very dark at the margin, forming a fine contrast with the colour of the other segments. It made its appearance this year in the importations of L'Horticulture Internationale of Brussels.

FLOWERS IN SEASON.—We have received from Messrs. CRANE & CLARKE, florists, March, two varieties of new Tree Carnations, specially fragrant,

and well-formed; the one, *Grace Battles*, is of light rose-pink, with serrated margin to the petals, full, and of fair size; the other, *William Scott*, is a larger and also well-formed bloom, of a deep cerise—a very desirable variety.

STOCK-TAKING: SEPTEMBER.—It was at one time an article of faith, that the consumption of chemicals was a fair index to the condition of trade in the United Kingdom; last month there was a larger falling-off in the amount of chemicals imported—therefore, of course, trade is bad! How stands the fact? The imports show a decrease to the amount of £107,369, as compared with the month of September last year—much of this is attributable to the falling-off in the imports of live-stock and the depreciation in the values of other food supplies—not omitting chemicals! Exports show advance of £670,730. Of this latter, more anon. We extract the following from the "Summary" table of the Trade Returns for last month:

IMPORTS.	1892.	1893.	Difference.
	£.	£.	£.
Total value for month	£31,485,305	£31,377,938	-107,369
§II.—(A.) Articles of food and drink—duty free	12,127,503	12,008,558	-118,945
(B.)—do., dutiable	2,520,935	2,234,980	-285,955
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)	2,228,117	2,417,330	+189,213
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	1,129,463	4,031,494	+2,902,031
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,007,458	1,219,028	+211,570
(B.)—Parcel Post ...	34,672	46,764	+12,092

It would be unfair not to make mention of the fact that, though six items in the import table show a decrease, the other six of the dozen, constituting the summary, show an increase. Always interesting are the figures in connection with fruit, roots, and vegetable supplies from the colonies and abroad, extracted from the general mass of figures, as follows:—

IMPORTS.	1892.	1893.	Difference.
Fruits, raw:—			
Apples bush.	405,825	307,642	-98,183
Cherries "	150	—	-150
Plums "	109,099	115,786	+6,687
Pears "	197,493	207,303	+9,810
Grapes "	185,135	214,299	+29,164
Unenumerated "	122,137	107,149	-14,988
Onions "	593,281	555,243	-38,038
Potatoes cwt.	87,555	37,303	-50,252
Vegetables, unenumerated, raw, ... value	£91,211	£89,609	-£1,602

The lack of "enumeration" in vegetables is a thing to be deprecated; but we must pass on to the next item of

EXPORTS.

under which heading, as already stated, there is a falling off in the present month, amounting to £670,730, principally in textile, raw materials, and in metals, and manufactures therefrom. Our success as a great manufacturing nation depends to a great extent on cheap fuel as well as cheap raw material—the latter we have in abundance, the first is "blocked," and the price of that sent to market puts a stop to machinery in most branches of manufacture. There can be no improvement in trade whilst the terrible coal strike exists. Nowadays, there is no gardening establishment of any size but feels the baneful effects of dear fuel. The present barbaric system of arranging trade difficulties stops the loom, the hammer, the locomotive, and both coasting and sea-going steam vessels; but the daily press have enough

to say on this subject, and to spare. Beyond the reduced exports of British and Irish manufactures, there is a falling-off in the exports of foreign produce from the great world's emporium—freights will not pay at the cost of fuel to carry them. One item may be noticed in the matter of wood exports: the Germans are sending by way of Trieste into the eastern world quite a large supply of parquet flooring; much of this is doubtless on British account. Canada and Tasmania—other colonies also—have immense stores of the necessary raw material; splendid wood-working machinery can be had from home, labour is cheap enough, surely, and the waste made in lopping and squaring-up would be almost sufficient fuel for the motor. Perhaps our friends at the Antipodes and elsewhere will make a note of this; there is a good deal of gold on the earth's surface. Notwithstanding the gloomy look of things at home, our trade is not in a sick condition—only good-feeling is lacking, and may triumph ere our next stock-taking.

PRESENTATION.—When it became known a few weeks ago that Mr. RUSSELL was about to retire from the post of head gardener at Poltallock, Loch Gilphead, Argyllshire, and leave the district, after thirty-nine years' service, his many friends decided to present him with some tangible acknowledgment of the respect and esteem in which he was held in Kilmartin parish. On Monday evening, the 2nd inst., the subscribers, including Mr. R. A. MEIKLE, factor on the estate, the Rev. J. DEWAN, M.A., B.D., minister of the parish, assembled at the Kilmartin Hotel, and presented Mr. RUSSELL with a valuable gold watch, bearing a suitable inscription. Mrs. RUSSELL was also presented with a very chaste diamond-and-gold brooch.

LA SEMAINE HORTICOLE.—Under this title M. LUCIEN LINDEN intends to publish a weekly Horticultural Journal on the model of the English journals. The *Illustration Horticole* and the *Journal des Orchidees*, will both be merged in the new journal, which will make its first appearance in January. We await the new comer with sympathetic interest.

GARDENING AND FORESTRY EXHIBITION.—On Monday evening, October 9, Mr. HARRY TURNER, of Slough, was entertained at dinner by a number of friends at the Gardening and Forestry Exhibition, in recognition of his services as President of the Horticultural Section of the Exhibition. Mr. H. E. MILNER presided, and warmly eulogised Mr. TURNER'S services in organising the numerous floral exhibitions that have been held during the season, and in the decoration of the gardens. A handsome eperguez was presented to Mr. TURNER as a memento of the occasion.

THE SURVEYORS' INSTITUTION.—The first ordinary general meeting of the session 1893-94 will be held on Monday, November 13, 1893, when the President, Mr. CHARLES J. SHOPPEE, will deliver an opening address. The chair will be taken at 8 o'clock.

AN INTERESTING EXPERIMENT WITH VEGETATION.—The air which is contained in the interstices of the soil is well known to be richer in carbonic acid gas than the atmosphere. In soil that has recently been manured with stable droppings, &c., the proportion may reach ten per cent. The experiments made by BOEHM some years ago appeared to show that a large proportion of carbonic acid gas is injurious to plants. Recently S. JINNY has re-studied the matter, growing plants in glass pots, and passing in, through a tube inserted in the bottom, air enriched with a known amount of carbonic acid gas. He found that in almost all cases the result of supplying the roots and soil with air containing four, five, and twelve per cent. of carbonic acid gas was injurious to the plants experimented upon, namely, Haricots, Rye, and Lupines. Wheat, however, is an exception, and it is possible that plants which do not thrive in recently-manured soil are particularly

susceptible to this action. Further details of these experiments may be found in the *Ann. Agronomie*, v. xviii., pp. 594 to 597.

OCTOBER HORTICULTURAL MEETING AT GHENT.—Certificates of Merit were awarded "à l'unanimité" for the following plants:—To M. E. BEDINGHOUS for variegated *Yucca*, eight varieties, of which *Y. gloriosa* var. *medio picta*, *Y. g. aur. mar.* and *Y. g. var. arg. marg.* were the most noticeable; to M. ALF. VAN IJMSCHOOT for *Sobralia xantholeuca*, a species but rarely seen in flower at the meetings—the petals are whitish, sepals and lip bright yellow; to M. F. DESNOIS for *Caryopteris mastacanthus*, a pretty *Verbenad*, blooming at a time when flowers are scarce; this should prove an excellent market variety. Certificates of Merit were allotted to M. JULES HYE for *Cypripedium præstans*, a remarkable hybrid described in the *Gardeners' Chronicle*, 1886, p. 776; to Madame la Marquise DE MAORIN for *Miltonia Moreliana* var. *atropurpurea*, remarkable for the depth of colouring and width of the divisions; to M. ED. PYNÆERT, for *Phoenix insignis*, an elegant variety of *P. reclinata* *Sanderiana*; to M. WATTECAMPS, for a yellow tuberous *Begonia*, with a firm stem—this will be valued in the future for its erect habit; to M. H. MILLET, for tuberous *Begonia*s, with streaked flowers spotted with rose, streaked and marked with white on both surfaces, a very pretty flower; to M. JULES HYE, for *Cypripedium gloriosum*, a hybrid between *C. Lawrenceanum* and *C. Harrisianum*, the lip very large, background green, lined with dark brown spots, border rosy, shading into white; to M. H. MILLET, for *Kentia Belmoreana compacta*, very dwarf, with nine handsome and very sturdy leaves, petioles exceedingly sturdy. Certificates for Botanical Merit were awarded to M. L. DESMET DUVIVIER for *Urtica pelata*. Certificates for Cultivation and Blooming were allotted to M. F. VAN DRIESSCHE for *Physianthus sericifera* (*alias albens*), a good old specimen-plant, well grown, and flowering profusely. *Ch. D. B.*

MR. GEORGE CANNON.—We understand that Mr. CANNON, who has been manager of Messrs. LEE & SON'S Ealing Branch Nursery for a period exceeding twenty-nine years, has resigned that appointment, having taken over the established nursery business carried on for the last twenty years by Mr. WEEDEE at Ealing; and, in addition, has secured several acres of land adjoining, which he will doubtless make into a very nice nursery. Mr. CANNON has had a good training for his new venture, in which we wish him success, having been trained at OSBORN'S Nursery, Fulham, famous in those days for fruit trees. From here he betook himself to another famous fruit-tree nursery—SMITH'S, of Worcester—for four years, and then began his connection with the old-established firm of LEE at Ealing. Here his special work has been fruit trees, Roses, trees, and shrubs. In landscape gardening matters in Ealing and surrounding districts, Mr. CANNON has had no small measure of success.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—On the occasion of the meeting of the Floral Committee of the above, on September 9, the following awards were made:—First-class Certificates: to Mr. F. van der Wissel, of Epe, for *Chamaecyparis Lawsoni* *Wisseli*; to Mr. K. Wezelenburg, of Hazerswoude, for *Ailanthus glandulosa pendulifolia* and *Eulalia japonica gracillima*; to Messrs. E. H. KRELAGE & SON, of Haarlem, for *Cactus Dahlias* Mrs. G. Reid, Mrs. B. D. Liddel, *Glory of Swanley*, H. Cannell, *Lilliput Dahlia* Hoffman von Fallersleben, and *Begonia tuberosa fl.-pl.* James C. Scott; to Messrs. Groenewegen & Co., of Amsterdam, for *Cactus Dahlia Delicata*; to Mr. J. Th. van den Berg, Jun., of Jutfaas, for *Cactus Dahlia* *Glory of Swanley*, *Dahlia fl. simpl.* *Etoile de Lyon*, *Dahlia fl. simpl.* *Attraction*, and *Dahlia fl. simpl.* *Ne Plus Ultra*; to Mr. C. G. van Tubergen, Jun., of Haarlem, for *Kniphofia hybrida* *Star of Baden-Baden* and *Lilium Henryi*. Second-class Certificates: to Messrs. E. H. KRELAGE & SON, of Haarlem, for *Nagelia hybrida*

and N. h. Artaban; to Messrs. Groenewegen & Co., of Amsterdam, for *Helianthus multiflorus elegans*; to Mr. Th. van den Berg, Jun., of Jutfaas, for *Cactus Dahlia* *Garten Inspektor Umlauf* and *Dahlia fl. simpl.* *Mignon*; to Mr. A. P. Bouwman, of Arnhem, for *Aster chinensis* var. *Comète*; to Mr. A. van Naamen van Eemnes, of Zwolle, for *Abies excelsa elegantissima*; to Mr. C. G. van Tubergen, of Haarlem, for *Kniphofia hybrida* *Stella* and K. h. Ophir. Botanical Certificates: to Messrs. E. H. KRELAGE & SON, of Haarlem, for *Gladiolus oppositiflorus*; to Mr. C. G. van Tubergen, Jun., of Haarlem, for *Kniphofia natalensis* and *K. pauciflora*.

THE CHISHLEHURST AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION commenced its 1893-94 session on Tuesday, October 10, this being the third year of its existence, the President, Mr. LYNE occupying the chair. A paper was read during the evening by Mr. DAVIS, entitled "Gardeners and Gardening," which was well discussed. A motion was unanimously carried that the Association renew its subscription to the *Gardeners' Orphan Fund*. The President mentioned in the course of his remarks that the membership now numbered ninety.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The annual dinner of this excellent Society was successfully held on Tuesday last at the Cannon Street Hotel, City, under the chairmanship of P. C. M. VEITCH, Esq., of the Exeter Nurseries, who was supported on the right by H. J. VEITCH, Esq., and CLARENCE SMITH, Esq., M.P. for East Hull; and on the left by N. N. SHERWOOD, Esq., and many distinguished members of the horticultural world were present. The room was tastefully decorated with plants and flowers furnished by friends of the Society. The toast list was agreeably short, and after that of the "Queen and Royal Family" had been duly honoured, the Chairman proposed the toast of the evening, "The United Horticultural Benefit and Provident Society," and during a long and acceptable speech, remarked that this society commended itself to him peculiarly because of the sturdy independence it encouraged, afterwards alluding to the immense progress the society had made during recent years compared with that achieved during its early history. There were now 500 members upon the books. The Benefit Fund had a capital of £5,486, the Benevolent Fund one of £859, and the Management Fund one of £37. The society had been managed in the most economical manner, the only paid officer being the Secretary. Speaking of any improvements in the rules that might be desirable, the chairman said that he would like to see a graduated scale of subscriptions in proportion to the age of the member at the time of initiation. In conclusion, he could only wish them in conjunction with their motto, "Unity is strength," that they might have "more power." The toast was coupled with the name of N. N. SHERWOOD, Esq. In replying, Mr. SHERWOOD made a special appeal in favour of the Convalescent Fund, and declared, amid cheers, that he should have pleasure in giving £50 to the Convalescent Fund in honour of the Jubilee of his firm (Messrs. HURST & SON), which occurred this year. In proposing the Honorary and Life Members, Mr. J. HUDSON said that the Society was particularly strong in its Scotch membership, and he thought that in itself was a capital recommendation. The toast was coupled with the name of W. MARSHALL, Esq., who, in reply, thought it very unexplainable that the Society's membership did not increase with even greater rapidity. He also made an appeal on behalf of the Management Fund. CLARENCE SMITH, Esq., M.P., in replying for the Visitors, thought that friendly societies were quite right in declining interference from the Legislature in the matter of old age pensions, and expressed his intention of becoming an honorary member of the Society. H. J. VEITCH, Esq., then proposed the officers of the Society, and congratulated the members on

possessing the same officers who managed it when much smaller in importance. Mr. VEITCH had pleasure in giving £10, five of which he wished to be appropriated by the Convalescent Fund, and five by the Management. Coupled with this toast were the names of Mr. WHEELER and Mr. COLLINS (Secretary), both of whom suitably replied. After that of the Chairman had been humorously proposed by ARNOLD ROSS, Esq., and replied to, a very enjoyable evening was brought to a close. Special thanks were accorded to the donors of the flowers and fruits, and the surplus was to be sent to Guy's Hospital.

TORQUAY DISTRICT GARDENERS' ASSOCIATION.—We have before us the rules and programme of this active Society in the form of a neat little book. The first meeting was held on October 6, when a paper on "Botanical Curios" was read by the President, W. LAVERS, Esq. The meetings will be held fortnightly, and will conclude on March 30. Practical and botanical subjects are included, and we wish the Society a very successful season. The Hon. Sec. and Treasurer is Mr. F. C. SMALE, Knowsley, Avenue Road, Torquay.

PYRETHRUM PARTHENIFOLIUM AUREUM CRISPUM.—Specimens of a form of this useful garden plant, with beautifully crisped leaves, come from Mr. FRED. ROEMER, seed grower, Quedlinburg, Germany, who expresses a hope that he will shortly be able to distribute it. It is striking in appearance, and no doubt the many who are eagerly on the look-out for novelties for hedging will give it a trial; one of the advantages of the plant is, that while it gives a fine feature in the summer flower garden, it is also available for effect in winter. We have also received a plant of the same variety from Messrs. HURST & SON, 152, Houndsditch, under the name of *Pyrethrum aureum cristatum*.

PUBLICATIONS RECEIVED.—*Deutsche Pomologie*, with coloured plates. Second edition. (PAUL PAREY, Berlin.)

JOTTINGS FROM GUNNERSBURY PARK.

At this fine place near Acton, S.W., belonging to the Messrs. De Rothschild, there were, some fortnight ago, several very interesting things to be seen. Certainly one of the best of these was a span-roofed house filled with the lovely perpetual-flowered *Carnation*, Mrs. Leopold de Rothschild, which Mr. Reynolds intends to send out shortly. It is much like Miss Joliffe, and to many minds it will commend itself as an improvement upon that favourite variety. It has the same free, bushy habit, and when first opening, the flowers have the same delicate tint of pink; afterwards, however, the flowers of Mrs. Leopold de Rothschild deepen into a lovely shade of rose. They are much larger than those of Miss Joliffe, and, as a rule, the calyx does not split until they become old. The petals are slightly frimbriated, and often bear very minute spots of deeper colour. The flowers are borne on erect stems, and are well displayed; nor must we forget to add that they possess a pleasing fragrance, without which the finest *Carnation* yet raised would lack its best characteristic. It blooms freely for ten months during the year, and furnishes an abundance of bloom at a time when *Carnation* blooms are rare. The plants at Gunnersbury Park are mostly young plants from cuttings that were struck last autumn, and are now in 48-sized pots, well grown bushy specimens, and carrying large and striking blossoms. Altogether it is a variety that is likely to become distinctly popular.

Ixoras are always well done here, and Mr. Reynolds may be congratulated upon the appearance of a houseful of fine healthy plants at the present time; the *Eucharis* in a house adjoining are also healthy; and in this house was a splendid plant of *Phalenopsis Schilleriana*, just throwing a strong spike.

Vanda teres, too, is still a success here; there are two batches, one at either end of a span-roofed house, one lot in particular was very strong and well-ripened, and will be sure to produce a good quantity of bloom. In one of the lean-to houses was a number of plants in pots of *Euphorbia Jacquinæflora* on a high shelf at the back; the shoots are trained along a trellis downwards towards the front of the house, and Mr. Reynolds said they looked wonderfully well when blooming, which may well be imagined, for the ties may be loosened and the shoots allowed to hang carelessly.

Some plants of *Dendrobium Phalænopsis* were carrying blooms on mere offshoots from the older pseudobulbs, showing how very free to bloom is this charming species. There were three plants of it in bloom, and each was different, though it would be difficult to say which was the prettiest or best.

In the vineries were some capital bunches of Black Alicante Grape, Mrs. Pince and Lady Downes. Trebbiano was quite characteristic, with a colony of bunches being developed from one shoot. Only a few good bunches of Muscats remained uncut. In the splendid large span-roofed vinery, the varieties are chiefly Black Hamburg; this house is about 60 feet long, 40 feet wide, and 18 feet high.

Figs, which in so many gardens meet with but little care, are here well done, and a fine batch of plants in pots standing in hot pits, were just beginning to ripen a crop of fruit.

Melons also are grown very extensively, and sixty ripe fruits were cut from the plants at the time of our visit; and others were fit for cutting. One variety, a seedling from Triumph \times Hero of Lockinge, deserves particular notice. The plant had four fruits upon it, one of which weighed 9 lb. 5 ounces, the other three being nearly as heavy. Of its flavour we cannot speak, but it seemed good, and especially suitable as a market fruit.

A batch of 4000 excellent Strawberry plants for forcing were noted in pots, the crowns plump and well developed, which should be pretty generally the case this year. If plants are good at this date, the quality of the forced fruit is assured, granted that ordinary attention is bestowed; but, on the other hand, with weak plants and badly-developed crowns, it is impossible to obtain satisfactory results. There were 500 Chrysanthemums, rendered dwarf by pinching—none are grown for exhibition purposes. Some hot-water pits were filled with Gardenias and Pines.

The pleasure-grounds looked charming, and we think there is no other private place within so short a distance of Charing-Cross that can boast any so fine. The lake adds wonderfully to their beauty, and in the Italian garden and elsewhere, the beds are filled with good plants tastefully arranged. One bed, though simple, was highly pleasing; it consisted of *Salvia patens* and the yellow variegated *Abutilon*. Another noticeable feature at this season is the quantity of *Ampelopsis* growing and hanging about in all sorts of places, hiding the scars that age has inflicted on trees, and in some cases entirely screening stumps of trees long since dead. Just now, when the foliage has assumed so many lovely tints, the plants considerably enliven the grounds. In a narrow border, along by the side of a span-roofed house, was one of the best bloomed batches of the exquisite *Belladonna Lily* we have seen, just such another lot as may be seen each year under the T-range at Kew. The border faces nearly due south, and each year until this one, the plants in the half border running along by the stove have been considerably earlier than those nearer the greenhouse; but this season the order has been reversed, the gardener being quite puzzled to find the reason for this. The plant cannot be too highly recommended for planting in all similar places, viz., narrow borders running along the south fronts of warm houses in the South, and it will do well in the Midlands when the season is favourable, for we have often seen it bloom well in Staffordshire. What the bulb requires is a tolerably mild, dry winter and hot spring, that the bulbs can become

thoroughly developed and perfected before they bloom, and a little winter protection from cocoa-nut fibre, rough leaf-mould, or coal-ashes. The flowers are everyone's favourites, and they are as useful as they are chaste and beautiful.

HOME CORRESPONDENCE.

VIOLAS.—I hope those who may have lost plants from the excessive heat and drought will not be disheartened, and will again use them for early spring and summer decorative work, planting them in the autumn if possible; failing this, then in early spring, putting them in either case in soil moderately manured, and making them snug and firm. Up to the beginning of September, or August perhaps in the south, it was truly a *Viola* year. Then they began to succumb to the heat and drought, although in holding soils they still held out bravely. In one large garden, I saw long rows and large beds of Dean's True Blue, and Countess of Hopetoun, white, still in full flower at the end of August. In another, on a border with a south-eastern aspect and fully exposed to the sun, Duchess of Fife made a grand show, finer as a mass than I ever saw it, and remained so up to the end of August. In the middle of September, in a large garden near Drayton Manor, Sir Robert Peel's place, I saw William Neil, a soft pink, and Violetta, a dwarf-growing white, with small flowers, and as fragrant as a *Violet*, in full bloom, and defying the heat and drought. In all these cases they were in rich loamy soil, and spring-planted. New varieties are being annually introduced, and only a few days since a batch of blooms of some very fine seedlings were sent to me from Scotland, and these, and others, will be sent out in the spring. Some very beautiful varieties have also been raised in the north of Ireland. A mixed bed of varieties is a bright and pleasing object, and a test bed in a garden would give an excellent opportunity for testing which are best suited to the district, giving them room enough, and keeping the dwarf growers in front. The *Viola* is a hardy plant, and should be kept, even when in frames, fully exposed, excepting in very bad weather, and even then avoid shutting them up when damp. It is a too common practice to buy and have them sent through the post, and planted out immediately. If well-rooted and strong plants, this may be done; but if they were planted in a frame in good soil for a few days, to begin rooting, and then lifted carefully and planted in genial weather, there would be fewer failures. *W. D.*

EARLY CELERY.—This has been rather a trying season for Celery and other crops requiring abundance of water, and in places where there has been a scarcity, doubtless a quantity of that earlier planted will run to seed. Our first trench was planted on May 19; from this we have been digging nearly a month, and notwithstanding the very dry season and no water being given after it was first planted, I am agreeably surprised to find Celery that is crisp and well-flavoured, the variety grown being Wright's Grove White. *J. S. Upcer, Wigganhorpe.*

POINCIANA GILLIESII.—I forward to you the blossom of a shrub (*Poinciana Gilliesii*) of exceptional splendour. I told you when it began to blossom this year in May, and it is in full bloom now, and will go on till frost. The shrub is more than 15 feet high, and was grown by me from seed of Thompson of Ipswich (the best *4d.* I ever spent in my life); but I had to nurse the young plants for twelve years before they blossomed, and now they have been rewarding me increasingly for the last five years. It improves wonderfully every year, and what it will be in five years from now, if it goes on at the same pace, I cannot think. The foliage is graceful in the extreme, and waves about in the sunshine most delightfully. Contrary to all expectation, this South American shrub laughs at all extremes of heat or cold which it ever has to endure in the Isle of Wight, and when *Fremontia californica*, much to my sorrow, was cut down at its side, it seemed to be superlatively happy in the fierce heat which it had to endure. I think it would be well if *Poinciana Gilliesii* had a much more extended trial over the south of England. I remember saying in May that I fancied there would be a second edition of spring this year. A *Laburnum* is in full blossom not far off; and the flower which I enclose for your inspection is an unexampled curiosity. It

is a perfect specimen of *Narcissus*, Mrs. J. B. Camm, which blossomed in April last. So it is with other things. *H. Ewbank.*

GRAHAM'S ROYAL JUBILEE APPLE.—I noticed your correspondent's remark on Graham's Royal Jubilee Apple. It is indeed a fine Apple. I have grown fruit this season on a small three-year-old tree, measuring nearly 14 inches in circumference, and weighing nearly 20 oz. I also give you the size of six others that I have grown very fine, if you have room to insert them. Anna Elizabeth, 13½ inches circumference; Cox's Pomona, fine coloured, 13 inches circumference; King of the Pippins, 13 inches circumference; Reine de Bretagne, nearly 12 inches circumference; Reineette du Canada, 13 inches circumference; Court Pendu Plat, over 10 inches circumference. *W. Potten, Cranbrook, Kent.*

A GOOD MICHAELMAS DAISY.—Of all the Michaelmas Daisies now in flower here, this first week of October—and I think I have most of the best—is a white variety of *Aster puniceus* (*Asa Gray*), called at the Chiswick Conference, var. *pulcherrima*. It flowers nearly two months later than the type, grows very upright, and has flowers of great substance and persistence, nearly 2 inches across, larger than those of any other Michaelmas Daisy I know. It is a fine plant for the back row of a herbaceous border in October, as it grows at least 6 feet high. Michaelmas Daisies here are later than usual in coming into flower. *C. Wolley Dod, Edge Hall, Malpas.*

AMARYLLIS BELLADONNA.—Nothing in these gardens has shown the effect of the warmth of the past six months so much as a long border of the above-named handsome flowering Lily. The border is about 100 feet long. It is at the base of a wall facing south, which carries the roofs of three plant-houses, viz., stove, fernery, and warm greenhouse. The border is about 18 inches in width, and is raised a few inches above the alley that runs in front of it, by a row of bricks set ends into the soil. We made it some twelve years ago, by first removing the natural soil, which is of a stiff limestone nature, some 18 inches deep, then putting in a layer of broken bricks, some 6 inches in thickness, as drainage, covering these with a sod, grass-side downwards, and filling with a mixture of two-parts peat, sandy loam, and one of old peatting-soil. The bulbs were planted in October, about 4 inches in depth, and they were placed 1 foot apart; they have flowered more or less each year since. The greatest number of spikes produced previous to this year was in the warm summers of 1884 and 1887. In neither of those cases, however, was the supply at all equal to what it is this year; there have been over 500 spikes in all this season. When at their best, about a fortnight ago, they presented a charming effect, when seen from one end. As showing the necessity of ground-heat in assisting to ripen and mature the bulbs when they are in leafage, I notice that there are fully three times the number of flowers on the portion of the border fronting the warmer houses. The hot-water pipes on the other side of the wall evidently warmed the soil in this part much more than that facing the greenhouse. The pipes have been used very little since March. *H. J. C., Grimston.*

EBOR PEA.—Permit me to draw the attention of those of your readers who may not have already grown the above-named Pea to its great merits as a mid-season and late variety. We have grown it here for the past two years, and for the purpose named we find it a really first-class Pea. It is the most like that well-known and free variety, *Ne Plus Ultra*, though with us it is distinctly superior to it in all respects. For the future it will replace that variety with us, and when I say that during the twenty-eight years I have made out a seed list *Ne Plus Ultra* has always been one of my standard kinds, it will be seen how much I value its improved prototype, *Ebor*. We are picking nice dishes of it for table nearly every day. I believe Messrs. Backhouse of York were the originators of the variety, though it can be acquired from other sources, I have no doubt. *H. J. C. Grimston, Tadcaster, October 7.*

THE CHISWICK ONION TRIALS.—As some amateurs who may have read the report in the *Gardeners' Chronicle* of the Onion trials, will be apt to harbour the opinion that the seven varieties therein recommended are the best for general garden purposes, I beg to state, with all due respect to the committee, that if readers are guided

by this report, they will in five seasons out of six, find themselves upon the wrong track. I aver that three of the finest Onions for general purposes best suited to our English climate, are not mentioned therein at all. These three sorts are Deverill's Rousham Park Hero, Deverill's Improved Wroxton, and Cranston's Excelsior. I am not going into the question of Onions for competitive purposes, but simply varieties that can be obtained anywhere at a cheap price per ounce. The report bears out what I have already observed, viz., that foreign-saved seed has generally answered very well this exceptionally hot season. I see the committee recommend, as one of the seven varieties, Italian Tripoli. Do they mean one of the common varieties of Tripoli seen in every catalogue? or the variety offered by Mr. Deverill this year, to which he has given the name of The Italian? Perhaps Mr. Barron or one of the committee will kindly afford this desirable information. In conclusion, I am quite aware, with respect to Deverill's Cocoa-nut, that it is "really the outcome of years of careful selection from the original stock of Excelsior" (this is the introducer's description); consequently the committee are really recommending a much improved type of the variety recommended by me. Were seeds of Cocoa-nut obtainable at a cheap rate, I should substitute this for Excelsior, but I am advising cheap-priced good varieties for 1894. *Pioneer*.

RARE FRUITS AND VEGETABLES.—The dwarf Juneberry named in the interesting notes of your correspondent in the *Gardeners' Chronicle* for October 7, is no doubt the American form of the European *Amelanchier vulgaris*, called *A. botryapium* or *Mespilus canadensis*. It has been much advertised by American nurserymen, but I have not grown it, as I find its congener the *A. vulgaris* = *Mespilus Amelanchier*, which grows and blooms freely, is never able to set any of its fruit, owing to its being attacked by the caterpillar of a small moth, which worries the pretty sweet-scented white flowers to destruction. If the species named by your correspondent is free from this pest, it must be well worth growing; the *A. vulgaris*, which grows abundantly in the limestone rocks which overhang the Lake of Garda, and other Italian lakes, is now lovely in the purple and scarlet colour of its autumnal foliage, which is as conspicuous as the white flowers in spring. I am always surprised that the Cape Gooseberry, *Physalis edulis* = *peruviana*, is not more grown in England; it lives with me in pots in an unheated house, but it requires some additional warmth, even in such a season as the present, to ripen its deliciously-flavoured berries, which make a jam resembling in colour, and fully equal to, but differing in flavour from, that made from Green Gage Plums; it is largely grown in Madeira for this purpose. *Cydonia* (*Pyrus*) *Maulei* has produced a very heavy crop of fruit this year, which has been made into jam; it has an exquisitely semi-acid and scented flavour, quite unlike ordinary Quince jam. It is most easily raised from the pips, and flowers and fruits abundantly the second and third year from seed. I quite endorse what your correspondent says about *Finocchio*. For years I have tried to grow this plant, and this exceptional season I anticipated success—but no; despite the most careful watering, earthing-up, &c., it has decided not to form its Celery-like, semi-bulbous mass of leaf-stalks, but has "bolted" to seed, leaving only some straggling plants like ordinary Fennel. I have been told, and am inclined to believe it, that this vegetable does no good north of the Arno. I have eaten it north of that river. *R. Mills-Redhead, Holden Clough, Clitheroe*.

LATE STRAWBERRIES.—It may interest some of your readers to know, that on October 7, I picked 24 lb. of very good Strawberries, 21 lb. on the 9th, and 19 lb. on the 10th, which were sold by Mr. Geo. Monroe in flat punnets of 1 lb. each. I hope to pick a good few yet, as there are at the present nine or ten good Strawberries on each root. *R. J. Griffin, Farnborough, Kent*.

SUBSTITUTES FOR THE CALCEOLARIA AS A BEDDER.—The varieties of *Calceolaria* have become subject to a malady which affects the stems, and the plants die in a few days. I have tried every means I can think of to prevent it; I have put fresh mould into the beds, but all no good. This black disease, which is a fungus, attacks the plants when they are in full bloom. Last spring I tried the following three plants instead of *Calceolarias*, with great

success, viz., Tuberous *Begonias*, with yellow flowers, which make grand beds all the summer, and keep good till the frost cuts them off, then I take the tubers up and store them in a dry shed till the spring, when they are started in a gentle heat. *Begonias* strike easily from the young shoots, and can sometimes be divided, making good plants the same season, besides being easily raised from seeds, which come true if saved from a good yellow variety, fertilised with another yellow-flowered variety. I have also some fine yellow beds of *Zinnia Haageana*, a beautiful double-flowered orange-yellow variety, 12 inches high. The plants are still in bloom (October 7), and are very much admired. The seeds were sown in March in pans, in gentle heat, and made nice plants that were ready for the beds by the end of May. *Calceolaria pinnata* is another good plant for bedding, which is free, and soon fills the bed. The flowers are of a pale lemon-yellow colour, and last the season through; seeds may be sown in March in shallow pans, and placed in a cold pit. The seedlings make nice plants by the time they are required for planting out. *Wm. Smythe, Basing Park Gardens, Alton*.

HAWKSTONE.

AFTER a pleasant drive of a dozen miles from Shrewsbury, the writer of these notes, which are mainly jottings from memory, arrived at Hawkstone, the delightful residence of Viscount Hill, whose ancestors have resided there since the time of Henry VI. There are several entrance-ledgea to the park (which covers an area of 1600 acres of red loamy land); the one through which I entered the demesne (Weston-under-Red-Castle) is both commodious and handsome, and favourably impresses the visitor who comes to Hawkstone for the first time, and these impressions are fully realised when the finely-timbered park is entered, and landscape effects of a very varied character and picturesque are disclosed. To the left of this drive is a large lake, to the right an undulating greensward studded with groups and specimens of fine Oaks, Elms, Beeches, and Spanish Chestnuts, the latter being very large, and of fine proportions.

In this part of the estate are thousands of black rabbits, and a few brown and grey ones. Right in front is the old fortress of Red Castle, and towering high above the drive is an immense perpendicular mass of rock, through which the roadway is cut; this rock is partly covered with trees and shrubs. Close by is the Hermit's Hut, in which Charles I. is said to have been concealed, and communicating with this hut is a winding passage or tunnel cut through the rock. A column 112 feet high stands on a hill 700 feet high, surmounted by a statue of Sir Roland Hill, the first Protestant Lord Mayor of London, in whose memory it was erected by the tenantry and friends of the family. From an observatory on the top of the pillar, fine views are obtained over, it is said, a dozen counties when the air is clear. The mansion is an imposing-looking building, facing westward, and covering three sides of a square. It commands fine views of the park and surrounding country.

The pleasure-grounds and flower-garden are extensive, and comprise a variety of pleasing and interesting features, including fine specimens and banks of *Rhododendrons*, both in the grounds and park, some being about 18 to 20 feet high; of *Cedrus atlantica*, *Pinus excelsa*, *Abies pinsapo*, *Abies cephalonica*, about 80 feet high; *Abies grandis*, *Pinus Douglasi*, *Cryptomeria elegans*, &c. The flower-garden, made in the geometrical style, was resplendent with flowering plants.

The glass-houses are fairly numerous, and consist of a conservatory, some plant-stoves, four vineries, each about 45 feet long, two Peach-houses, a Fig-house, besides Melon and Cucumber-houses. In the vineries, good crops of Black Hamburgh, Lady Downes, and Black Alicante Grapes were observed. The walls in two of the lean-to hot-houses were finely covered with *Cissus discolor* and *Selaginella denticulata*, the latter growing in moss and mould kept in position by wire-netting fixed pretty close to

the wall. One of these hot-houses was filled with *Nepenthes Rafflesiana* and *N. Hookeri*, chiefly the former, the plants being in fine condition, with large pitchers, and plants the picture of good health, showing that Mr. W. Carr, like his predecessor, the late W. Pratt, whose foreman he was at Hawkstone, understands the requirements of these singular plants. *H. W. W.*

SOCIETIES.

ROYAL HORTICULTURAL.

OCTOBER 10.—The meeting in the Drill Hall, James Street, Westminster, on Tuesday last, was an exceptionally good one. Fruit was shown in unusual quantity, and the size and good quality of many of the Pears was quite remarkable. Two large tables running down the centre of the hall were filled with dishes of Pears and Apples, and some were accommodated on tables at the side. There were also specimens of Dahlias and Chrysanthemums, sprays of ornamental trees and shrubs, a good collection of *Adiantums* and other Ferns, and some novelties in *Anthrums* and Orchids, besides very interesting exhibits from the Royal Gardens, Kew, and from M. Lucien Linden, Brussels.

Floral Committee.

Present: Owen Thomas, Esq., in the Chair; and Messrs. H. Herbst, R. Dean, G. Stevens, H. B. May, C. J. Salter, J. Jennings, R. H. Lowe, J. E. Pearson, J. D. Pawle, W. Watson, H. Cannell, C. E. Shea, T. Baines, C. Jeffries, H. H. D'Ombrain, J. Bennett-Poc, E. Mawley, and G. Gordon.

A very choice collection of sprays of flowering and ornamental trees and shrubs was staged by Messrs. Geo. Bunyard & Co., Maidstone, including *Hypericum elatum*, *Rhus typhina*, *Cornus mas variegata*, *Acer atropurpureus*, &c. (Bronze Banksian Medal).

In the competition for twelve bunches of herbaceous plants, the 1st prize was very worthily won by Mr. G. H. Sage, Ham House Gardens, Richmond, Surrey, who had a very fine lot; Miss Debenham, St. Peter's, St. Albans, was 2nd. Messrs. H. Cannell & Sons, Swanley, had a stand containing excellent blooms of Dahlias, one of the varieties named Old Gold, an extremely pretty bloom, with centre of dark rose, was awarded an Award of Merit. Also a stand containing some charming varieties of *Pelargoniums* in most lovely shades of Pink, and a collection of good *Chrysanthemum* blooms (Bronze Banksian Medal). Mr. Geo. Phippen, Reading, had an extremely dark crimson Cactus Dahlia named Geo. Phippen.

From the Right Hon. Joseph Chamberlain, Birmingham, came three hybrid *Anthuriums*. Two of these had white spathes, one of which was accompanied by pink coloured spadix. The third was a large and pretty pink spathe, and white spadix.

Messrs. R. Veitch & Son, Exeter, showed sprays of Pink Ernest Ladham, *Colutea arborescens purpurea*, and the old garden plants *Zauschneria californica* and *Plumbago Larpenae*.

Mr. J. Arnold, Stoke, Devonport, received an Award of Merit for decorative Dahlia Miss Arnold, a very attractive rose-coloured bloom. Mr. J. Lansdell, The Gardens, Barkby, near Leicester, had a yellow and rose-coloured Dahlia, named Beauty of Barkby.

From A. de Rothschild, Esq., Halton, Tring, gr., Mr. Sanders, came a magnificent collection of *Begonias*, mostly varieties of *Begonia semperflorens*, which had been lifted from the open beds. A number of each variety was shown in large flat baskets, and created a good deal of interest. One of the most striking amongst these was a variety called atropurpurea, with very deep-coloured flowers and foliage, which colours considerably when grown in the open. B. Carrière has flowers of palest pink. All the varieties are very charming, and well worth putting in quantity into beds for summer decoration (Silver Flora Medal).

A collection of *Begonia* blooms came from Mr. G. A. Farren, Forest Hill, London, S.E.; and some sprays of *Quercus americana* [*rubra*] *plendens*, with finely-coloured foliage, which was awarded a First-class Certificate, from Mr. A. Waterer, Knap Hill Nursery, Woking, Surrey.

Mr. Robert Owen, Castle Hill Nursery, Maidenhead, had a stand containing fine *Chrysanthemum* blooms. A Japanese variety slightly incurved,

named Mrs. P. Blair, was granted an Award of Merit; the flower is nearly white from pale pink, and has rose markings.

Awards of Merit were also granted to two winter or perpetual-flowering Carnations, shown by Mr. J. Godfrey, Exmouth. Reginald Godfrey is very fragrant, and of a pleasing shade of pink, the petals crimped and slightly fringed; the other is called Mary Godfrey, a pure white, with fringed petals, and fragrant.

One of the best collections of Adiantums we have seen staged for some time was contributed by Mr. H. B. May, Dyson's Lane Nursery, Upper Edmonton. A fine batch of *A. Farleyense* was included, and amongst the tinted sorts were several good varieties of *A. Ghiesbreghtii*, two varieties of *A. tetraphyllum*, and many others. Conspicuous also were good plants of *A. curvatum*, *A. elegans*, *A. tenerum*, *A. concinnum*, *A. Bausei*, &c. (Silver-gilt Flora Medal).

From the Royal Gardens, Kew, came three plants in bloom of a new hybrid *Tecoma* named *Smithii* = *T. capensis* × *T. velutina*; it has pinnate foliage, the leaf-stalk and midrib about 8 inches long, leaflets $1\frac{1}{2}$ to 2 inches long, and half an inch wide, set at rather wide intervals; the flower has an exteriorly orange-coloured tube, and yellow segments—the interior being also of a yellow tint (Awarded a First-class Certificate). Several examples of *Streptocarpus kewensis* in variety were shown as cut blooms; a flower truss and shoot attached of the brilliant scarlet *Bomarea patagoensis* was shown—a splendid climber, rivaling *Lapageria rosea* (award a First-class Certificate). *Clematis Standishii*, with flowers of the general aspect and colour of *Anemone japonica*; *Solanum Wendlandii*, a grand flower-spray of a soft delicate blue colour, and of finer proportions than we have hitherto observed it. It was figured in our issue for September 16 in the current year, but our illustration scarcely does the plant justice (Award, a First-class Certificate). *Ptycoraphis Augusta* is a very graceful Palm, with pinnate foliage, the earliest of which seem to be of the same type as the later (Award a First-class Certificate). *Melianthus Trimenianus*, from Namaqualand, has delicately pinnatifid leaves and terminal erect spikes of rosy-red blossoms, which are individually half an inch long. *Kniphofia Modesta* has a thin, tall spike of white flowers of small size, and dwarfish foliage. Natal.

In Messrs. L. Linden's (Brussels) collection of plants, was a remarkable *Anthurium* named *Wambeckiana*, a variety with green leaves, of the usual type, and a large spathe of a dead white, furnished with a white spadix. Apparently it is a desirable addition to this class of plants, for the contrast it affords with scarlet and pink-spathed varieties (Awarded a First-class Certificate). *Hemianthus Lindenii*, the flower bearing a striking likeness to *H. bicolor*, was likewise shown, the plant stood more than 2 feet high, and was furnished with a number of massive corymbs of flowers of a pinkish-red colour (Awarded a First-class Certificate).

Messrs. J. Veitch & Sons, Chelsea, S.W., exhibited a fine lot of plants in bloom of *Caryopteris mastacanthus*, the bright blue terminal and axillary flower making a pretty show. It was figured in the *Gardeners' Chronicle*, vol. xxi., new series, 1881, p. 149.

A nice boxful of warm-house *Rhododendrons* came from the same nurseries—Minnie, a flower of a rich orange colour, seemed to us to be new. A fine boxful of the Chelsea cross-bred *Streptocarpus* in a variety of colours formed part of the exhibit. *Carnation*, Madame Thérèse Franco, a flower full, fragrant, of a deep rose-pink, and with fringed petals, received an Award of Merit.

A number of plants of *Amasonia punicea* in flower was likewise shown by the Chelsea firm.

Messrs. Perkins & Sons, Coventry, showed *Cactus Dahlia Matchless*, a flower of the true form; colour of the deepest crimson, and velvety texture; also *Cactus D. Purple Prince*, equalling the first in form. The latter received an Award of Merit.

Mr. S. Mortimer, Nurseries, Rowledge, Farnham, Surrey, showed three large market-boxes filled with flowers of *Stephanotis floribunda*, and six dozen Show and Fancy Dahlias, of good quality so late in the month (Bronze Banksian Medal).

Five dozen *Chrysanthemum* blooms were shown by Mr. Wells, Earlswood, but little may be said of them.

Mr. T. Ware, Hale Farm, Tottenham, had a good bunch of the fine, bright-looking *Aster grandiflora*; some blooms of the pretty yellow *Pompon Dahlia Emily Hopper* (Award of Merit); a variety of *Cactus Dahlia*, and also a plant of

Nerine elegans alba; and *Esther Swan*, an orange-coloured single *Dahlia*, with a crimson disc, which received an Award of Merit.

Three dozen excellent examples of Japanese and incurved varieties of "Mums" came from Messrs. Pitcher & Manda, United States Nurseries, Hextable, Swanley; very good were *Golden Wreath*, C. W. Childs, F. L. Ames, and *Bouquet des Dames*.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Sec.), De B. Crawshaw, Sydney Courtauld, T. B. Haywood, Thos. Statter, H. Williams, E. Hill, H. Ballantine, H. M. Pollett, and W. H. White.

The show of Orchids was both extensive and interesting, the large basket of the brilliant vermilion *Habenaria militaris*, shown by Sir Trevor Lawrence, Bart., Burford, Dorking (grower, Mr. W. H. White), being one of the brightest exhibits, and showing more cultural skill than any exhibit of the year. It was awarded a Silver Flora Medal. Sir Trevor Lawrence also sent his fine *Cypripedium* × *Lawrebel*, a plant of C × *conco-Lawre*, with a most extraordinary abnormal flower, having two labellums, and the other segments most curiously misplaced; and *Dendrobium Mirbellianum*. One of the richest exhibits was a select group of Orchids from Messrs. Linden, l'Horticulture Internationale, Parc Leopold, Brussels. One of the best things was the large pure white *Warscewiczella Lindenii*, which received a First-class Certificate on June 7 last year. Five varieties of a fine and distinct strain of the Turroeri section of *Laelio-Cattleya elegans* were also exhibited, viz., L.-C. *Ilacina*, L.-C. *Lindenii*, L.-C. *Luciani*, L.-C. *Margaritæ*, and L.-C. *Treyerana*; L.-C. *Luciani* being selected and given an Award of Merit. The sepals were broader than in other forms, and more equal in size with the petals; of a rich purple, with an emerald-green shade. The front of the labellum was of a dark velvety-crimson, and the base clear white. Three magnificent forms of their *Cattleya labiata* (*Warocqueana*) were also shown, all grand in form; C. *Warocqueana fascinator* being very large and superb in colour (Award of Merit). Of the forms of *Cattleya eldorado*, C. e. *Owenii*, with very large flowers, the petals and sepals pure white, the front of the labellum dark mauve-crimson, and the throat rich yellow, was given an Award of Merit. C. e. *Lindenii* was also very handsome, having crimson-tipped petals, and being near to C. e. *ornata*, Rehb. f.; C. e. *Treyerana* had blush-white sepals and petals and fine labellum. Other fine exhibits were *Cypripedium Rothschildianum Lindenii* var., with four flowers on a spike; C. × *Spicero-Lowianum*, a very pretty hybrid of the parentage named, which also received an Award of Merit; *Odontoglossum grande variabile*, O. *crispum* var.; *Cypripedium* × (*Hookeri* × *Veitchii* var.), *Cattleya Alexandræ*, some flowers of their fine strain of C. *Acklandiæ*, a cut spike of a phenomenally large C. *gigas*, and a fine plant of *Cochlidia vulcanica grandiflora*. The group was awarded a Silver Flora Medal.

Messrs. Jas. Veitch & Son, King's Road, Chelsea, exhibited two very handsome hybrids in *Cattleya* × *Chloris* (C. *Bowringiana* ♀, C. *maxima* ♂), which had a stout spike of several flowers, each 5 inches across, and having all the rich colouring of C. *Bowringiana*, with the more ample labellum and greater size of C. *maxima*; it is a very worthy and free-growing introduction (First-class Certificate). The other was *Cattleya* × *Phedima* (*intermedia* ♀, *maxima* ♂), an exquisitely delicate flower of the form of the pollen parent. The sepals and petals were blush white veined with pale pink; the lip yellow at the base, veined with deep purple, the ground colour being the same as the petals (Award of Merit). Messrs. Veitch also showed their fine *Cypripedium* × *Arthurianum pulchellum*, very superior to the original.

Messrs. F. Sander & Co., St. Albans, had a select group of Orchids, in which the many varieties of their strain of autumn-flowering *Cattleya labiata* were very effective, and quite ideal flowers for the time of year. *Pescatorea Klaborum* and *Batemanoia Bartii* were representatives of a class of Orchids which thrive better at St. Albans than anywhere else. A pretty pan of *Phalenopsis Lowii*, *Cypripedium* × *Copineanum*, C. × *Cecilia*, C. × *Eyermanni*, C. × *cananthum superbum*, *Oncidium incurvum*, O. *Kramerii*, O. *Cebollita*, and the new and pretty hybrid *Cattleya* × *Kranzlinii* were also in the group, which secured a Silver Banksian Medal.

From the Royal Gardens, Kew, came the charming hybrid, *Disa* × *Premier* (*Veitchii* × *tripetaloides*).

The flowers were nearly as large as those of D. × *Veitchii*, and of a rich rosy-crimson colour. The plant is very stout-growing, and the inflorescence many-flowered, and evidently lasting over a long period (First-class Certificate).

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N., had a group of Orchids, in which were several very pretty varieties of *Dendrobium Phalenopsis Schroderianum*, D. *bigibbum*, D. *superbiens*, and D. *Goldiei*, all of the same section, and perhaps never before so well shown together. *Pachystoma Thomsonianum*, too, was well exhibited; its pretty white and crimson flowers are always admired. Other good plants were *Cypripedium* × *Pitcheianum*, Williams' var., the best of its class; C. × *Ashburtoniæ expansum*, the highest coloured of its section; C. × *Adonis*, C. *tonsum*, C. × *Arthurianum*, *Lycaste lanipes*, *Miltonia Rozzlii*, &c. (Silver Banksian Medal).

Messrs. Hugh Low & Co., Clapton, also staged a pretty group, in which the specimens of *Vanda Kimballiana* were very effective; *V. Sanderiana*, *V. tricolor*, *Cattleya Alexandræ*, C. *maxima*, C. *eldorado Wallisii*, *Stanhopea Amesiana*, *Dendrobium Lowii*, *Cypripedium bellatulum*, and other *Cypripediums*, &c., were included (Silver Banksian Medal).

J. Forster Alcock, Esq., North Church, Berkhamsted, sent *Cattleya bicolor*, C. *labiata*, and a grand variety of *Odontoglossum grande*, with seven flowers on a spike.

Major-Gen. E. S. Berkeley, Southampton, showed *Odontoglossum Uro-Skinnerii album*, a rare variety in which the lip is pure white. It was said to have been raised from seeds (Award of Merit).

Messrs. W. L. Lewis & Co., Chase Side, Southgate, showed *Habenaria cinnabarina* (Botanical Certificate).

F. Hurdy, Esq., Tyntesfield, Ashton-on-Mersey (gr., Mr. Thos. Stafford), showed flowers of a very large form of *Laelia pumila præstans*.

W. E. Brymer, Esq., M.P., Hingston House, Dorchester (gr., Mr. John Powell), sent a flower of his hybrid *Laelio-Cattleya* × *Brymeriana* = × *Cattleya Rothschildiana* × *Cattleya Warscewiczii*, a very distinct plant.

A. J. Hollington, Esq., Forty Hill, Enfield, showed a hybrid *Cattleya*, with flowers like those of C. *Schroderæ*, *Cypripedium* × *Richardsoni*, and C. × *Smithii*. In neither case was the parentage given.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. John Lee, H. J. Pearson, T. F. Rivers, W. Wilks, A. Moss, P. C. M. Veitch, G. Banyard, A. Dean, H. Weir, J. A. Laing, W. Bates, G. T. Miles, C. Ross, G. H. Sage, J. Hudson, Geo. Wythes, H. Balderson, F. Q. Lane, and G. Norman.

A First-class Certificate was given to Pear *Beurré Tonqueray*, shown by Messrs. Jas. Veitch & Son, Chelsea. This is a good sized heavy Pear, of good flavour, ready in October. It is very hardy, and withstands spring frosts unusually well. The same firm also contributed a very large collection of Apples and Pears, including about two hundred dishes and baskets of Apples, and thirty-five dishes of Pears. Amongst the most noticeable in a very fine collection were Apples, *Baumann's Red Reinette*, *Seaton House*, *Alfriston*, *Bismarck*, *Margil*, *Sandringham*, *Mrs. Barron*, *Mère de Ménéage*, *Beauty of Stoke*, *Winter Hawthornden*, *American Mather*, *Peasgood's Nonsuch*, *King of the Pippins*, *Belle Pantoise*, and *Alexander*. Also some fruiting sprays of their *Raspberry Superlative*, showing that in absence of frost the variety will furnish fruit quite up to the winter (Gold Knightian Medal).

A magnificent collection of Apples and Pears was that set up by Messrs. Geo. Bunyard & Co., Maidstone. There were 120 dishes of Apples, and all dessert varieties, which were staged in their different families, constituting quite an object-lesson, and giving facilities for comparing each variety with others of its own section. The Apples were extremely bright-looking, and were well coloured, but it is quite impossible to specify those which were deserving of notice. There were four *Calvilles*, twelve varieties of *Pearmain*, five of *Russets*, eight of *Reinettes*, nine of *Nonpareils*, three of *Kernels*, nine of *American kinds*, twenty-eight *Pippins*, and a quantity of miscellaneous. The finest of the Pears were *Vau-Mons Lion le Clerc*, *Vicar of Winkfield*, *Princess*, *Uvedale's St. Germain*, *Gilgill*, *Andry Leroy*, *Pitaston Duchess*, *Beurré Superfin*, *Grosse Calchasse*, *Burré Diel*, and *Beurré Clairgeau* (Gold Knightian Medal).

Messrs. Jno. Laing & Sons, Forest Hill, S.E., had

another collection of Apples and Pears. Very good were Apples *Bienheim Orange*, Warner's King, *Grandier*, *Golden Reinette*, *R-inette du Canada*, *Beauty of Kent*, and *Sandringham* (Silver Knightian Medal).

Another collection of Pears (sixty dishes) came from Mr. Owen Thomas, of the Royal Gardens, Windsor; these fruits, though not exceptionally large, were even, pretty specimens (Silver Banksian Medal).

Mr. W. Crump, of Madresfield Court Gardens, Malvern, staged forty-three dishes of fine Pears, in illustration of the lecture he delivered in the afternoon. *Doyenné du Comice* was shown remarkably well, the heaviest fruit weighing 1 lb. 2 oz.; it was grown on a free stock against a west wall. The heaviest fruit of *Pitmaston Duchess* was 1 lb. 14 oz.; *Beurré Diel*, *Duchess de Orleans*, and many others, were excellent (Silver Knightian Medal).

Mr. Jno. Watkins, Pomona Farm Nurseries, Withington, Hereford, contributed a grand display of Cider Apples of wonderful colour, and also eighteen dishes of first-class Pears in size and quality (Silver Knightian Medal). P. Saillard, Esq., Buchan Hill, Crawley (gr. Mr. Jno. Martin), had another collection, consisting of sixty-one dishes of Apples and Pears. The quality of this exhibit was like most of the others shown on Tuesday, very good, some of the dishes being particularly so (Silver Knightian Medal).

Messrs. H. Lane & Son, Berkhamsted, had a grand lot of their Apple *Prince Albert*, also some very fine specimens of a new Apple named *Hambling's Seedling*, which was awarded a First-class Certificate.

Messrs. Cheal & Sons, Lowfield Nurseries, Crawley, exhibited some Pears, also good specimens of their new Apple *Atalanta*, and tubers of *Potato Prizefighter*.

Three exceptionally fine dishes of Pear *Marie Louise* were from Mr. Sydney Ford, who received a Cultural Commendation. Very large Bramley's Seedling Apple were sent by Mr. Ed. Molyneux, Swanmore Park Gardens, Bishops Waltham; they were taken from maiden trees planted in 1891. A Seedling Apple, named *Mrs. Hooper*, was sent by Messrs. Laxton, Bros., Bedford, but no Award was made.

A dish of Pears *Doyenné du Comice*, sent by Charles C. Tudray, Esq., The Cedars, Wells, Somerset, were perhaps the best ever shown; the twelve fruits weighed 13 lb., and the largest specimen 1 lb. 4 oz. (Bronze Banksian Medal).

Six Pears, *Grosse Calabasse*, weighing 7 lb. 3 oz., and a few fruits of a seedling Apple, were staged by Mr. Jos. Lane, Palgrave, Diss, Norfolk; and Mr. Druce, Upper Gattin, Merstham (gr. Mr. Manzey), had ten extraordinary fruits of Pear *Pitmaston Duchess*; three fruits weighed 1 lb. 15 oz. each, and the ten fruits, 17 lb. 6 oz. They were taken from a cordon, which carried twenty-seven fruits, and which weighed 38 lb. 2 oz. The heaviest fruit was 2 lb. 2 oz. (Bronze Banksian Medal). A Smooth Cayenne Pine-apple weighing 9 lb., and sent by Mr. Owen Thomas, Royal Gardens, Windsor, was Culturally Commended; as were also four dishes of Pears sent by Mr. Jno. Masterson, Weston House Gardens, Shipton-on-Stour. Mr. J. Day, Galloway House Gardens, Garliestown, received a Bronze Banksian Medal for twelve dishes of very good Pears.

There were four varieties of European Grapes contributed from the Society's Gardens at Chiswick; they were *Miller's Burgundy*, *Morris' Early*, *Duchess*, and *Eperione*.

A Gourd, weighing 154 lb., came from Mr. J. Miller, gr. to Lord Foley, Ruxley Lodge, Esher (Cultural Commendation).

Several Potatoes that had been tried at Chiswick were presented before the committee for examination, and the following kinds were all granted First-class Certificates:—*Jeannie Dean*, of medium size, rather rough skin, with small eyes, from Messrs. Carter & Co., Holborn; *Nellie Langtry*, another rather rough-skinned variety, from Mr. Fletcher, Ackerley; *Major Meoc*, from Mr. H. Finsham, Cranbrook; *Conference*, from Mr. Dean, Ealing; *Early Regent*, from Messrs. Jaa. Veitch & Sons, Chelsea; *Success*, from Mr. Taplin, Gloucester; and *Redclyffe Kidney*, from Mr. Selby.

Awards of Merit were given to the following Onions:—*Southport Yellow Globe*, *Southport Red Globe*, and *Deverill's Cocoa-nut*, from Mr. Deverill, Banbury; *Globe Madeira* and *Italian Tripoli* from Messrs. Vilmorin, Andreux, & Co., Paris; and *Prize-taker* from Messrs. P. Henderson & Co., New York.

Lecture on Pears.

In the afternoon a very instructive lecture on Pears was read by Mr. Wm. Crump, of Madresfield Court Gardens, Malvern. Mr. Crump commenced his paper by declaring that there is a very great demand for fine luscious Pears, and said that this demand was most inadequately supplied. Pears might be classed into three kinds: 1, choice fruits grown in houses, and those imported from France, &c.; 2, ordinary ones grown on standards and wall-trees, &c.; 3, *Perry Pears*. The lecturer said that in regard to fruit of finest quality, we should never be able to compete successfully with the growers in more favourable climates; but in the 2nd class it was found that there could be produced, as the effect of good culture, fruit of very good quality, and such as will meet with a very great demand. Most of the earlier kinds were found to ripen well on standards, and therefore walls and other more favourable situations should be reserved for later kinds, that more juice and less fibre, "or indigestible grit," as the lecturer described it, might be present.

Mr. Crump then went on to speak of lifting all trees on the free stock when they had been planted three or four years, that good fibrous roots might be induced. These roots were encouraged by judicious mulchings, and by the use of chemical fertilisers, which, the lecturer said, did not produce a strong woody growth so much as fruitfulness. As quality instead of quantity was the lecturer's aim, he deprecated the gridiron system of training, and advised cordons, as being the most productive, easily replaced, and enabling the grower to produce all the best varieties. Incidentally, Mr. Crump described *Doyenné du Comice* as the best Pear in the world, and he recommended it for planting in all situations, declaring it was the very last to fail in giving a good crop of first-rate quality. The important subject of pruning—so fully discussed in our columns recently—next received attention, and afterwards the question of distribution. Mr. Crump declaring that in some cases he had known personally there had been a profit of about 1000 per cent. to account for between leaving the producer's hands and reaching those of the consumer. Gathering and storing were then dealt with, and Mr. Crump concluded his paper by referring to several of the more injurious insects to which the Pear was liable.

Mr. Geo. Bunyard, who occupied the chair, afterwards offered a few remarks, generally agreeing with the ideas of the lecturer, and emphasizing the uses to which old bags and rags can be applied as a manure for fruit trees.

NATIONAL CHRYSANTHEMUM.

OCTOBER 9.—A meeting of the General Committee took place at Anderson's Hotel on the above date, Mr. Robert Ballantine in the chair, there being a large attendance of members, including several delegates from affiliated societies. The Hon. Sec. announced that the sum of £17 17s. 6d. had been paid as prize-money at the September show, £14 17s. 6d. having been for Chrysanthemums, and £3 for vegetables—special prizes offered by Messrs. Sutton & Sons. A financial statement was also submitted, showing that the receipts to date amounted to £201 4s. 10d.; the several items making up that sum were given in detail. Also that since the beginning of the year 90 members had been elected, 80 of this number being ordinary, and 10 Fellows. Also that eight societies had been admitted to affiliation. The Hon. Sec. bore testimony to the services rendered to the Society by Mr. H. J. Jones, of Lewisham, who had introduced 23 new members. Seventeen ordinary members and one Fellow were elected.

At the conclusion of the ordinary business, Mr. C. E. Pearson, of the Chilwell Nurseries, Nottingham, read, at the invitation of the committee, a paper on "How to Improve our Chrysanthemum Shows." Mr. Pearson ably advocated reform in two aspects—one, changes in the methods of exhibiting cut flowers, which he described as frequently hideously formal; and recommended classes for a table of flowers of different types of Chrysanthemums set up with long stems in vases, &c., mingled with appropriate foliage, and also vases of flowers on straight stems so erect as not to hide their heads. He thought the provision of vases and glasses suitable for such an exhibit could be obtained at a moderate cost. As to groups of Chrysanthemums arranged for effect, he strongly denounced a collection of large flowers only, urging that all classes of Chrysanthemums should be included in such

groups, and not merely the Japanese and incurved sections only, as at present. He would discourage the use of large blooms as much as possible, and would employ foliage plants and Ferns in due proportion, to impart effect. He thought, instead of having plants on straight stems with one or two large flowers only at the top, bush-like plants carrying from eight to ten good blooms should be employed. Stakes to trained plants were also condemned, and the severely formal method of tying out the blooms was denounced.

The introduction of two or three classes to the schedule of prizes by way of beginning something in the way of reform was advocated, Mr. Pearson saying that exhibitors soon caught up ideas and applied them. Mr. Pearson concluded by stating that what he had put forth was with a view of promoting the best interests of the society, and resumed his seat amid hearty applause. Considerable discussion took place, and a general agreement in the views put forward by Mr. Pearson was expressed. The paper, together with a report of the discussion, will be published with the schedule of prizes early in the coming year. A hearty Vote of Thanks was passed to Mr. Pearson.

Royal Aquarium.

OCTOBER 11, 12, 13.—This Society has much reason to congratulate itself upon the very fine exhibition brought together on this occasion, for the floor of the building was completely filled, and a very bright and effective display was made all round; the table decorations in particular being most effective as well as numerous.

Two excellent groups of plants of Chrysanthemums were staged by Messrs. Norman Davis, nurseryman, Camberwell, and H. J. Jones, Ryecroft Nursery, Lewisham; and the judges found considerable difficulty in deciding which was the better, the 1st prize eventually going to Mr. Davis. The flowers in these groups were finely developed, and equal to those we have been accustomed to see at the November exhibitions. Mr. Davis was the only exhibitor of twelve plants of Chrysanthemums.

Cut blooms of Japanese varieties were particularly good, and another week would have brought many of them up to November form. The 1st prize for twenty-four varieties was awarded to Mr. H. Shoosmith, gr. to M. Houghton, Esq., Shirley, Croydon; his leading flowers, which were very fine, were *Mlle. Thérèse Rey*, *President Borel*, *Sunflower*, *Miss A. Hartshorn*, *G. C. Schwabe*, *Madame M. Hoste*, *Col. W. B. Smith*, *Madame Edouard Rey*, *Kentish Yellow*, *Mrs. C. H. Payne*, *Avalanche*, *Charles Shrimpton*, *John Shrimpton*, *Puritan*, *Mrs. Falconer Jamieson*, and *W. Tricker*; 2nd, Mr. C. Cox, The Gardens, Great Brickenden, Ilerts.

There was a very spirited competition with twelve Japanese, some very fine blooms being staged in this class also. Mr. W. Collins, Ponsbourne, Hertford, was 1st, with *R. C. Kingston*, *Puritan*, *E. Molyneux*, *Stanstead White*, *Madame M. Hoste*, *Sunflower*, *Avalanche*, *Mrs. F. Jamieson*, *G. C. Schwabe*, *Bouquet des Dames*, *Mons. W. Holmes*, and *Miss A. Hartshorn*; 2nd, Mr. Thos. Wilkins, The Gardens, Inwood House, Henstridge, Blandford. The best twelve blooms of incurved were shown by Mr. E. Rowbottom, The Priory Gardens, Hornsey, his leading flowers were very good for the season. These were *M. R. Babuant*, *Mons. Jules Barigoy*, *Refuge*, *Baron Hirsch*, *Mons. L. Parle*, *Mrs. Dixon*, and *Mr. Bann*. There were other classes for cut blooms, in which there were some good flowers staged.

Mr. J. R. Chard, floral decorator, Stoke Newington, took the 1st prize for a table of wreaths, bouquets, sprays, &c.—an excellent display; and he was also 1st with three vases or epergnes out of ten competitors; Mr. F. W. Sale, Sevenoaks, was 2nd. This class made a remarkable display.

Special prizes were offered by Messrs. Sutton & Sons for various vegetables, but the competitors were few, though the produce was good.

In the way of miscellaneous exhibits, Messrs. J. Laing & Sons, Stanstead Park Nursery, Forest Hill, received a Silver-gilt Medal for a large and striking group of *Begonia*, and a Silver Medal for a large collection of Apples and Pears. Silver-gilt Medals were also awarded to Messrs. J. Cheal & Sons, nurserymen, Crawley, for a very effective display of *Dahlia*s, and Apples and Pears; to Mr. J. Watkins, nurseryman, Withington, Hereford, for a very fine collection of Apples and Pears, the former remarkable for their brilliancy of

colour; and to Messrs. H. Cannell & Sons, Swanley, for vegetables and cut Dahlias. Silver Medals were awarded to Mr. H. J. Jones, Rycroft Nursery, Lewisham, for a collection of cut Chrysanthemums; to Mr. W. J. Godfrey, nurseryman, Exmouth, for the same; and to Mr. S. Mortimer, nurseryman, Farnham, for Dahlias and Stephanotis. Several Bronze Medals were also awarded.

FLORAL COMMITTEE.

A meeting took place in the library, at 2 P.M., W. H. Fowler, Esq., J.P., in the chair. First-class Certificate were awarded to Mr. W. J. Godfrey, for Eda Prasa, a very fine Japanese, creamy-white ground, flushed with rosy-pink, fully incurved. To Mr. Norman Davis, nurseryman, Camberwell, for Japanese, Louise, a fully incurved flower of a lovely shade of flesh-pink, and a most promising novelty. To Mr. H. Shoemith, Shirley, Croydon, for Japanese, Mdle. Théâre Rey, pure ivory-white, with long broad florets, a full handsome flower. To Mr. E. Rowbottom, The Priory Gardens, Hornsey, for Edith Rowbottom, a rosy carmine, full flower of excellent quality. To Mr. E. Beckett, The Gardens, Aldenham House, Elstree, for Japanese, Madame Edouard Rey, a rosy-pink reflexed handsome flower; and to Charles Davis, clear yellow, flushed with bronze, a sport from Viviani Morel—the early flowers of this fine sport come of a pale colour, as in the parent variety; this was shown by Mr. H. J. Jones, Lewisham. Several other promising incurved and Japanese varieties the Committee requested should be again sent to them. First-class Certificate were also awarded to Mr. T. S. Ware, for Cactus Dahlia Ernest Glasse, Pompon Dahlia Emily Hopper, and to Nerine elegans alba; to Mr. John Arnold, Stoke, Devonport, for decorative Dahlia Miss Arnold; to Messrs. J. Laing & Son, Forest Hill, for double Begonia Duke of Fife; to Messrs. H. Cannell & Son, Swanley, for Cactus Dahlias Old Gold and Cannell's Gem; and to Mr. A. Waterer, Knapp Hill Nursery, Woking, Surrey, for Quercus concolor coccinea.

KENT COUNTY HARDY FRUIT SHOW.

OCTOBER 10, 11.—This exhibition, held in the Corn Exchange, Maidstone, was by far the largest of its kind that has hitherto been held, and must have convinced everyone who saw it that an immense interest and zeal have been thrown into the cultivation of hardy fruits. In many of the various classes the competition was very keen, especially in class 1, that for single sieves of desert Apples, there being no less than seventeen competitors, and eighteen for that quantity of cooking Apples. The Society, with a view to the encouragement of fruit growing, offered liberal prizes for sieves, half do., and quarter do., as also for larger collections. Mr. Woodward, gr. to Roger Leigh, Esq., Barham Court, maintained his usual position in the large classes, followed by Mr. G. Chambers, Mereworth, who showed well; Mr. Manwaring, Brenchley; T. Oliver-son, Esq., East Sutton Park, Staplehurst (gr., Mr. T. Skinner); and Messrs. Goodwin & Fearon, Mereworth.

There were capital groups of plants exhibited, not for competition, from Linton Park, Mote Park, Preston Hall, and Barham—very meritorious collections; and also a magnificent display of fruits and vegetables were put up by Mr. Jarman, gr. to H. Brassey, Esq., Preston Hall.

Desert Apples.—One sieve: Mr. W. W. Hubble, The Elms, Hutton, was 1st, showing Cox's Orange; Mr. W. H. Fearon 2nd, Mr. S. H. Goodwin, Mereworth, 3rd; and 4th fell to Mr. A. J. Thomas, Sittingbourne. There were seventeen competitors.

Cooking Apples—Out of eighteen lots, Mr. Chambers, Beech Farm, took the lead, showing large and bright fruits of Warner's King; W. W. Hubble 2nd, and Mr. Leney, Court Lodge, Farleigh, was 3rd.

Desert Apples, Four Quarter-sieves, Distinct Varieties.—1st, Mr. S. H. Goodwin; 2nd, Mr. Thomas Manwaring, Brenchley; and 3rd fell to Mr. Chambers; there were fifteen competitors.

Desert Apples, Two Quarter-sieves.—1st, Mr. Hubble; 2nd, Mr. Fearon; and 3rd went to Mr. Austin Killick, Weaving, Maidstone.

Kitchen Apples, Four Quarter-sieves.—1st, Mr. Leney, showing large striped Beaufin, Lord Derby, Cox's Pomona, and good Tower of Glamis, the latter being the finest of that sort in the show; Mr. Lockyer, Mereworth, followed very close with Lady Henniker's, Stone's, Warner's, King and Cox's Pomona.

Kitchen Apples, Two Quarter sieves.—Mr. Hubble was 1st, with large and well-coloured Wellingtons and Blenheim's; 2nd, Mr. Chambers.

Pears, Two Quarter sieves.—Mr. Leney, Court Lodge, took the lead, showing large Pitmaaston Duchess and Uvedale St. Germain; 2nd, Mr. F. Leney, Wateringbury; 3rd, Mr. Manwaring.

Collection of farm fruits, nine dishes of Apples and three dishes Pears, twelve fruits to a dish. Mr. Goodwin showed good Hoary Morning, Stone's, Warner's King, King of the Pippins, Lady Henniker, and Pomona. Pears: Pitmaaston Duchess, Doyenné du Comice, and Hacon's Incomparable, and he was awarded the 1st prize. Mr. Thomas was a good 2nd, showing larger fruits, which fell somewhat short in colour; 3rd, Mrs. M. Fremein, Teston.

For four dishes of Apples and two of Pears, 1st fell to Mr. Fearon, and 2nd Mr. Austin T. Killick.

Collections of any fruits not named above, Mr. Chambers took the 1st, showing well preserved Cherries, Walnuts, Cobs, Medlars, Quinces, Shepherd's Bullaces, Plums, &c.; 2nd, Mr. Tooth.

For twenty-four dishes open. Mr. Woodward took the lead with a fine lot, Mr. Manwaring following, and the third fell to Mrs. Fremein.

Eighteen dishes of Apples and six of Pears: Mr. Woodward was again well to the fore, showing fine specimens of Beauty of Kent, Peasgood's Nonach, Cox's Pomona, Bedfordshire Foundling, Allfriston, Doyenné du Comice, Pitmaaston Duchess, Beurré Superfin, General Todleben Pears, &c. Mr. Chambers took 2nd honours, and his lot was also good, especially the Pears. Mr. Skinner was placed 3rd, with a very meritorious lot, his Apples being very fine. There were also prizes offered for dried fruit, jams, &c.

Mr. Frost, of the Borough Nurseries, exhibited a large stand of cut Dahlias, in which Pompons were a conspicuous feature.

CALIFORNIA.

MURRAYA EXOTICA.

I CANNOT recollect having seen any reference to Murraya exotica in the columns of the *Gardeners' Chronicle* of recent years. I therefore take pleasure in commending this beautiful shrub to lovers of fine plants. My experience with it has been as follows. Four years ago I purchased a plant from a Florida firm, a very small thing, and evidently a seedling. It is now 4 feet high, about 2½ feet in diameter, of perfect symmetry, and covered with its pure white, many-flowered corymba of deliciously-scented blossoms, much resembling those of the Orange, though smaller. Murraya is a Rutaceous plant, very close to Citrus, I should imagine; indeed, I have been informed that it can easily be worked on to Citrus trifoliata cuttings, though somewhat slow to strike, give a fair percentage of plants. The foliage of Murraya is extremely neat, rather small, dark glossy green, pinnately arranged, and quite persistent. This plant has a rather wide distribution, from southern and insular India to North Queensland; notwithstanding this ultra-tropical habitat, it flourishes well with us in the open air, and I fancy would succeed with you admirably under warm greenhouse treatment, taking care that the growth be thoroughly ripened. We grow Choisy's ternata, and think much of it, but Murraya is distinctly a finer thing, and deserves a place wherever fine plants are grown.

FEARS AND BEGONIAS.

To the ordinary observer, the arid, dusty, and russet appearance of much of the open or uncultivated country of Southern California is not suggestive of success in the culture of shade and moisture-loving plants; in the litoral regions the atmospheric humidity is, however, comparatively high during the summer and dry months, ranging between the extremes of 65° and 90°. The average summer humidity of Los Angeles, lying 18 miles from the sea, is about 78°. With this fact in view, and as our garden had become well shaded in places by trees and Palms, and quite protected against wind by trellis climbers, Bamboos, and Aruados, we were encouraged two years ago to attempt the culture of exotic Ferns and Begonias in the open ground, and

the measure of success attained far exceeds anything done within the limits of a small greenhouse. Selecting the most suitable place for a border, the natural soil was removed to a depth of 18 inches, 4 inches of rough gravel put in place, and overlaid by a compost of very old stable manure, clean river sand and leaf-soil, the following Ferns were then taken from the greenhouse and planted: *Adiantum formosum*, *A. excisum*, and *A. pubescens*; *Nephrodium molle*, *Ouychium japonicum*, *Pteris argyrea*, *P. longifolia*, and *P. cretica albo-lineata*; *Hypolepis repens*, *Nephrolepis pectinata* and *N. exaltata*, several Hawaiian species not determined, *Alsophila australis*, and *Dicksonia antarctica*, the latter two in tubs. After planting, their culture consisted of simply watering twice a week, the two Tree Ferns being sprayed on their trunks every day. The manner in which these plants have thriven is surprising, bold vigorous growths in quantity affording liberal license with the scissors.

The Begonias have been treated in exactly the same manner, and comprise a few of the commoner species, or varieties of the shrubby section, such as *B. fuchsoides*, *B. semperflorens*, *B. maculata*, *B. rubra*, *B. argyrea*, *B. Weltonensis*, and some other garden varieties. Associated with these we have *Nagelia zebrina* and *Gesnera refulgens*. Altogether, the plants are a marked success, growing with great vigour, and producing flowers copiously. *J. C. Harvey, Los Angeles, Cal., August 15, 1893.*

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0. Scotland, N. Principal Wheat-producing Districts.—
- 1. Scotland, E.; 2. England, N.E.; 3. England, E.;
- 4. Midland Counties; 5. England, including London, S.
- Principal Grazing, &c. Districts.—6. Scotland, W.; 7. England, N.W.; 8. England, S.W.; 9. Ireland, N.; 10. Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending October 7, is furnished from the Meteorological Office:—

"The weather during this period was again very changeable and showery, frequent heavy falls of rain alternating with intervals of bright sunshine. Much

lightning was observed from time to time, and in many parts of England and the south of Scotland thunderstorms were experienced.

"The temperature was a little below the mean in nearly all districts, but just equalled it in 'England, S. and E.,' and the 'Channel Islands.' The highest of the maxima were registered on October 1, and ranged from 58° in 'Scotland, N.,' to 67° in 'Eogland, E.' and the 'Midland Counties.' The lowest of the minima were recorded on the 4th over 'Great Britain,' and on the 7th over 'Ireland,' when they ranged from 28° in 'Scotland, E.,' 29° in 'Scotland, W.,' and 30° over both the 'Irish districts,' to 38° in 'England, S.,' and to 49° in the 'Channel Islands.'

"The rainfall was rather less than the mean in 'Scotland, N. and E.,' and 'England, N.E.,' as well as in 'Ireland, S.' In all other districts there was an excess, that in all the western and southern parts of England being large.

"The bright sunshine, notwithstanding the frequency of rain, was very prevalent generally, and exceeded the normal in all districts excepting 'Scotland, N.' The percentage of the possible duration which was actually recorded, ranged from 59 in 'England, E.,' to 39 in 'England, N.W.' In Scotland, however, the percentage was no higher than 18."

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

CAN some reader of the Gardeners' Chronicle give an idea of the time that must elapse before germination will take place in the case of seeds of the Palm *Acrocomia sclerocarpa*? I have had seeds in a bottom-heat ranging from 70° to 85° for three and a half years. Perhaps some old-timer will smile, but the seeds on being opened appear perfectly sound; the albumen is quite sweet, no sign of decomposition, and the germs appear quite sweet, plump, and sound, and can be removed with the point of a sharp knife. I have been informed indirectly that a gentleman in Florida raised plants of *Acrocomia Totai* which took five years to germinate. J. C. Harvey, Los Angeles.

MARKETS.

COVENT GARDEN, October 12.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

PRICES rule as last week.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns for flower types (Arom, Aster, Bouvardias, etc.) and prices in s. d. s. d. format.

ORCHID-BLOOM in variety.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with columns for plant types (Adiantum, Aspidistra, Asters, etc.) and prices in s. d. s. d. format.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with columns for fruit types (Apples, Cabs, Grapes, Peaches, etc.) and prices in s. d. s. d. format.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with columns for vegetable types (Beans, Beet, Carrots, Cauliflowers, etc.) and prices in s. d. s. d. format.

POTATON.

Trade continues in a very unsettled state, and prices very low, except for very best samples, which are readily picked up at from 85s. to 95s.; Medium, 55s. to 70s., Black Lands, 40s. to 45s. J. B. Thomas.

SEEDS.

LONDON: Oct. 11.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market devoid alike of business and of interest. Winter Tares, being apparently as nearly as possible exhausted, show a further advance. Giant seed Rye, on the other hand, continues cheap and good. Trifolium, being now most moderate in price, still finds buyers. Some few sales have taken place of new English Clover seed. Corn dealers and seedsmen, taking advantage of the present low quotations for Canary seed, are laying in their stocks for the winter. Hemp seed keeps steady. There is no change in Peas and Haricots. Linseed is firmer. Mustard and Rapeseed are without alteration. The Board of Trade Returns give the imports of Clover and Grass-seed into the United Kingdom for the first nine months of this year as 247,883 cwt., value £548,221, as against 207,493 cwt., value £456,631 for the corresponding period of 1892.

FRUITS AND VEGETABLES.

BOROUGH: October 10.—Quotations:—Cabbages, 4s. to 8s.; Savoys, 4s. to 8s.; Cauliflowers, 5s. to 8s. per tally; Turnips, 1s. 6d. to 2s. 6d.; Carrots, 2s. to 3s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 5s. to 6s. per bag; Apples, 2s. to 8s. per bushel.

SPIITALFIELDS: October 10.—Quotations:—Cabbages, 4s. to 8s.; Savoys, 4s. to 8s.; Cauliflowers, 5s. to 8s. per tally; Turnips, 1s. 6d. to 2s. 6d.; Carrots, 2s. to 3s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 5s. to 6s. per bag; Apples, 2s. to 8s. per bushel.

STRAFORD: Oct. 10.—The supply to this market during the past week has been excellent, and a brisk trade was done at the undermentioned quotations:—Cabbages, 3s. to 6s. 6d. per tally; Savoys, 5s. to 7s. per tally; Cauliflowers, 9d. to 1s. 9d. per dozen; do., 3s. 6d. to 8s. per tally; Brussels Sprouts, 1s. 3d. to 2s. per half-bushel; do., 2s. 9d. to 3s. 6d. per bushel; Celery, 9d. to 1s. 2d. per roll; Cucumbers, frame, 1s. 3d. to 2s. 6d. per dozen; Horseradish, 1s. 6d. to 1s. 9d. per bundle; Turnips, 2s. to 2s. 6d. per dozen bunches; Carrots, household, 40s. to 55s. per ton; cattle-feeding, 30s. to 40s. per ton; Parsnips, 6d. to 9d. per score; Mangels, 21s. 6d. to 24s. per ton; Sweet, 28s. to 30s. do.; Onions, English, 110s. to 120s. do.; Dutch, 4s. 9d. to 5s. per bag; Belgian, 5s. to 5s. 6d. per case; Apples, English, 2s. to 5s. per bushel.

FARRINGTON: October 11.—Quotations:—Onions, 5s. to 6s. per bag; Cabbages, 4s. to 8s.; Savoys, 4s. to 8s.; Cauliflowers, 4s. to 8s. per tally; Turnips, 1s. 6d. to 2s. 6d.; Carrots, 2s. to 3s.; Parsley, 2s. to 2s. 6d. per dozen bunches.

October 12.—Quotations:—Apples, Bienenheim, 4s.; do., cooking, 2s. 6d. per bushel; Pears, Calabasse, 1s. per half-bushel; do., common, 2s. 6d. per bushel; Damsons, 3s. per half-bushel; Plums, 5s. per half-bushel; Melons, 4s. per case; Grapes, 11s. 6d. per barrel; Tomatos, English, 4 1/2d. per pound.

POTATON.

BOROUGH AND SPIITALFIELDS: October 10.—Quotations ranged from 45s. and 105s. per ton.

STRAFORD: October 10.—Quotations:—Park-land Magnums, 40s. to 50s.; light do., 45s. to 60s.; Hebrons, 70s. to 85s.; Imperators, 50s. to 60s. per ton.

FARRINGTON: October 12.—Quotations:—Sutton's Abundance, 70s. to 80s.; Hebrons, 80s. to 90s.; Brues, 50s. to 60s.; Magnums, 45s. to 50s.; Imperators, 50s. to 60s. per ton.

LONDON AVERAGES: October 11.—Hebrons, 70s. to 90s.; Regents, 60s. to 80s.; Magnums, 45s. to 60s.; other descriptions, 45s. to 50s. per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 140s. to 160s.; new-do., 125s. to 145s.; inferior, do., 100s. to 120s. Hay, best, 145s. to 170s.; inferior, do., 90s. to 100s. New Mixture, 115s. to 130s.; and Straw, 35s. to 56s. per load.

APPLE RIBSTON PIPPIN: A Nine Years' Subscriber. The variety may be grown in a pot in an orchard-house, and it will attain fine proportions and bright colour, but the flavour of the fruit will be much improved by partly plunging the pot in coal-ashes out-of-doors, and surface-feeding with rich mulches, kept in position with a zinc band.

BOOKS: S. Grant. The best we can recommend for your purpose is Propagation and Improvement of Cultivated Plants, by F. W. Burbidge; published by Blackwood & Son, price about 7s. 6d.

CARNATIONS DISEASED: G. C. The leaves are infested by the now common fungus Helminthosporium echinulatum (variabile, Cooke). As the fungus vegetates within the leaf, no remedies will destroy it that do not destroy the leaf as well. Cut off all affected leaves, and burn them.—Amateur. Helminthosporium echinulatum. See above. For figure and description, vide Gardeners' Chronicle, August 21, 1886, p. 245.

CHRYSANTHEMUM BUD DEFORMED: A. W. W. The deformed bud sent is, as our authority tells us, but too common this season, and it is difficult to give a reason for this. Such buds are useless, having decayed at the extremity of the peduncle, rendering the further development of the flower an impossibility. As a rule, weakly-growing varieties like Mrs. A. Hardy, for instance, are much subject to the malady. The variety E. Molyneux, from which the specimen was taken, is, as a rule, robust of growth, but the bud sent us does not show it in true form, being weak in wood and leaf. The inability of the buds to grow-on is due to a check given to growth, probably while the bud was being formed. Such check might be caused by affording the plant too much or too little water, more probably the latter. The buds, being at a point farthest from the roots, would be the first to suffer from lack of root-moisture.

DAHLIA: J. A. The flower sent is a pretty decorative flower, resembling in colour J. Reuthe, a new Cactus variety. The colour is not yet common.

MELON-PLANTS DECAYING: A. F. The loss of plants is due to the presence of eel-worms on the roots. Throw out soil and plants, and make no more use of soil of the kind in which these plants were grown.

NAMES OF FRUITS: A. B. Pear Buerré Charnensia.—Enquirer, 1. Emperor Alexander; 2. Hawthornden; 3. Tibbett's Pearmain.—G. Winter. Pears: 1. Emille d'Ilévat; 2. Maréchal de la Cour; Apple: 3. Golden Noble.—J. E. Pears: 1. Jersey Gratiote; 2. decayed; 3. Gansel's Bergamot; 4. Buerré Superfin; 5. Maréchal de la Cour; 6. Buerré Boac.—G. Paul. Apples: 1. Manks Codlin; 2. not recognised; 3. Rymer; 4. Beauty of Kent.—Johnson & Sons. Apple Hambledon Deux Ans.—G. Abbey. Pear Soldat Espéren.—C. B. Pear Buerré d'Anjou.—J. John Foster. Pear Belle de Bruxelles.—Ed. Allen. 1. Hoary Morning; 2. Gipsy King; 3. Napoléon; 4. Buerré Diel.—G. H. 1. Cox's Orange Pippin; 2. Rawle's Reinette. W. Tait & Co. 1. Pitmaston Duchess.—W. W. 1. Grenadier; 3. Beauty of Kent; 4. Cox's Orange Pippin; 6. Reinette du Canada; 2 and 5, not recognised.—T. S. Pears: 1. Napoléon; 3. Belle de Bruxelles; 4. Swan's-egg; 5. Comte de Lamy; 7. Knight's Monarch; 2 and 6, not recognised.—W. Waddy. 1. Duchesse d'Angoulême; 2. Berkman's; 5. Bess Pool; 7. Claygate Pearmain; 8. Cox's Orange Pippin; 3. Pear Triomphe de Jodoigne.—Jas. Wellington. 1. Cox's Orange Pippin; 5. Wyken Pippin; 2. Ribston Pippin; 9. Buerré Diel; 6. Lord Derby; 8. Vicar of Winkfield. (For Answers to further questions, see our next issue.)

NAMES OF PLANTS: W. G. Norice. 1. Adiantum cardiolobum; 2. Blechnum occidentale; 3. Lastrea filix-mas cristata; 4. Adiantum bispidulum; 5. Asplenium mariatum; 6. Polystichum angulare proliferum; 7. Cyrtomium falcatum.—H. M. Oncidium microchilum.—F. M. 1. Davallia divaricata; 2. Pteris argyrea. We cannot undertake to name garden Dracaenas and Crotons.—U. C. B. 1. Mesembryanthemum album; 2. Nerine undulata; 3. Polygonum amplexicaule; 4. Asclepias curassavica; 5. Alonsoa linearis.—J. T. H., Fermoy. Begonia gracilis, syn.—B. Martiana. B.

diversifolia. B. bicolor.—N. J. M. D. 1, Scolopendrium vulgare; 2, Myrtus communis, narrow-leaved var.; 3, Acacia sps., send when in bloom; 4, Coronilla glauca; 5, Euonymus japonicus var. aereo-variegatus; 6, Eupatorium Weimannianum; 7, Asplenium bulbiferum.—G. M. C., Kingstown, Cirrhopetalum ornatisimum.—C. A. Long, Solanum marginatum. Ferns:—W. Cragg. The Ferns sent are:—Polystichum angulare var. cristatum; Lastrea Pseudomas cristata, and L. filix-mas grandiceps; Scolopendrium vulgare, (2) laceratum, (3) grandiceps naum, (4) ramo-cristatum, (5) and (6) grandiceps, all good. The only Athyrium worth naming are:—(2) A. subcruciato-cristatum, (4) cristatum, (5) Elworthii (?), (6) grandiceps, (9), Polydactylum, (11) Howardia, (14) apparently torto-cristatum. Of these, only 5 and 6 are good. Those unnamed are all defective, worthless seedlings, mainly of A. Craigii.

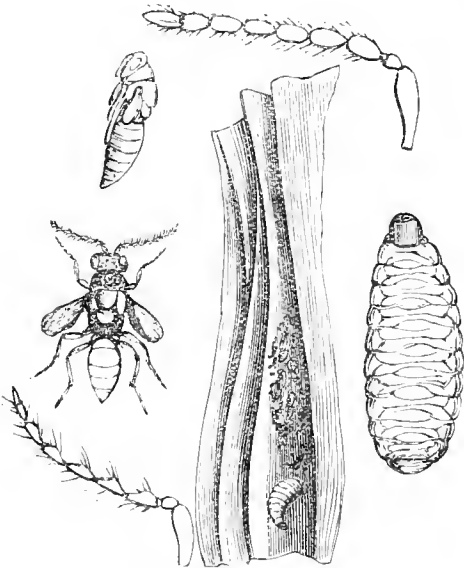

FIG. 83.—ISOSOMA ORCHIDEARUM. Insect infesting Orchids.

ORCHID INSECT: T. C. The pest is Isosoma Orchidearum, the Cattleya Fly (See fig. 83.) The only remedy we know of is to cut off all infected growths as soon as noticed, which may be seen in the young growths when about an inch high, becoming very thick at base, tapering up very sharply, and making but little progress. (See *Gardeners' Chronicle*, 1869, p. 1231.)

SCALE ON PEAR TREES: A *Nine Years' Subscriber*. Wash the bark with Gishurst Compound Soap in the proportion of 4 oz. to 1 gal. of water, doing this in mid-winter.

SPELLING OF VINE NAMES: L. Spith. The best authority on the Vine spells the one, Gros Colman, the other Foster's Seedling, or Foster's White Seedling. Mr. A. F. Barron in his *Vines and Vine Culture*, states that M. Leroy in his catalogue for 1860, spells the first-named Gros Colman; whereas Jacquemet-Bonnetont, of Annonay in 1858 calls it Gros Colmar; and De Bavay in 1852 calls it Gros Colman. It is the Gros or Grosse Kolner of the Germans, and its other names are merely corruptions of this one. Foster's Grape is named after a Mr. Foster, gardener to Lord Downe, Beningborough Hall, Yorkshire. It came from the same potful of seedlings as Lady Downe's Seedling. The cross was in both cases between the Sweetwater and Black Morocco varieties. This was about sixty years ago.

WOODLICE IN FERNS: H. W. P. Other remedies having failed to rid the pots of Ferns of the insects, you might try what effect Keating's Insect Powder has on them. It is harmless to plant life.

COMMUNICATIONS RECEIVED.—J. W.—B. P.—J. H.—Constant Reader.—W. J. Teesdale.—A. Plymouthisian.—W. C.—C. T. D.—Thos. Lewis, Abchurchham.—A. F. B.—M. C. C.—R. D.—W. B. Lathom.—F. F. G.—H. W.—R. W.—W. M.—T. H.—T. H. S.—C. H. H.—J. D.—M. T.—J. B.—M.—J. J. W.—W. W.—R. D.—H. M.—A. P.—G. F. Wilson.

REGISTERED COPYRIGHT.

SHOOTING and FISHING BOXES, GENTLEMEN'S RESIDENCES, COTTAGES, STABLES, COACH-HOUSES, &c., GAME LARDERS, SHEPHERD'S HUTS, and PORTABLE IRON BUILDINGS.

Descriptive Catalogue of all our Manufactures, including Iron Buildings for Shooting and Fishing Lodges, Stabling, Huts, Kennel and Poultry, Greenhouses, Garden Frames, &c., free on application.

Laundries, Annexes, and Additional Accommodation to existing Dwelling Houses carried out.

Testimonial from HERBERT GREG, Esq.:—"September 13, 1893. I am pleased to say the work was done very well, and have no doubt it will be very comfortable when finished."

BOULTON & PAUL, NORWICH.

FIXED.

THE IMPROVED GARDEN GULLY (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d.

(The larger sizes are very strong for carriage drives.)
Full Particulars and Testimonials on application.

PAINTER, GLAZIER.—Repair Hot-water Pipes. Willing to assist in houses. Married.—State wages to J. S., Junior, Tuddington, Winchcombe, Gloucester.

COWMAN.—Age 21, single; willing to assist in Garden. Experience with Cows, Pigs and Poultry. Good character.—F. JENNER, Oaklands, Wimbledon Park, Surrey.

"LOOK PLEASANT, PLEASE," is the earnest admonition of the painstaking photographer, when he tries to give a flattering reproduction of our features, for the admiration of friends or denision of enemies. We try to look pleasant, but, in thinking of the numerous ills that flesh is heir to, or the troubles that daily beset us, the process becomes at the best a distortion of the human face divine. If, however, our health is good, life's troubles lose much of their power to depress us. Holloway's Pills will bring us to this happy state, for if we take them regularly, disease is kept out of the system, our blood is pure and healthy, and the task of looking pleasant is made easy.

N.B.—The Auctioneers desire to call particular attention to this important Sale, comprising, as it does, such a large number of rare and valuable CYPRIPEDIUMS and other ORCHIDS, the whole for absolute Sale without the least reserve.

Toddington Nurseries, near Winchcomb,

GLOUCESTERSHIRE.

GREAT SALE OF NURSERY STOCK, by order of the Toddington Orchard Company, Ltd., in liquidation, comprising large quantities of FRUIT and FOREST TREES, SHRUBS, &c.; also PEACH TREES, a splendid lot of TREE CARNATIONS for winter-blooming, FERNS, and ROSES, all in pots.

The Fruit Trees include Standard and Half-standard, and Bush Apple and Pears of leading sorts, Gisborne and Pershore feathered Plum Trees, Black and Red Currants.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, on the Premises, The Nurseries, Toddington, near Winchcomb, on WEDNESDAY and THURSDAY, November 8 and 9, at 1 o'clock precisely.

May be viewed one week prior to the Sale. Catalogues had on the Premises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Bagshot.—Preliminary Notice.

IMPORTANT THREE DAYS' UNRESERVED SALE of beautifully-grown and well-rooted NURSERY STOCK, which has been carefully prepared for removal, especially selected for Sale, by order of Messrs. John Waterer & Sons, Limited.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, the celebrated Bagshot Nurseries, Bagshot, Surrey, on TUESDAY, November 21, and TWO FOLLOWING DAYS, several acres of NURSERY STOCK, grown to the greatest perfection, and exceedingly well rooted, including a fine lot of named Rhododendrons, Green and Variegated Hollies, Spruce Firs, and other Stock. Fuller particulars will appear.

Enfield Highway. The Brimsdown Nurseries.

Messrs. Protheroe and Morris are instructed by Mr. John Waller to sell by auction...

Every Day. DUTCH BULBS, GREAT UNRESERVED SALES.

Messrs. Protheroe and Morris will sell by auction at their Central Sale Rooms, 67 & 68, Cheapside, London, E.C., every day at 12 o'clock...

Monday Next.

English-grown LILIES, NARCISSI, IRIS, FREESIAS, new CARNATIONS, CALLAS, CANNAS, PINKS, CLEMATIS, IVIES, ROSES, 40 lots of Greenhouse FERNS, TEA ROSES in pots, Hardy BULBS, PLANTS, &c.

Messrs. Protheroe and Morris will sell the above by auction at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on Monday Next, October 23, at 12 o'clock.

Thursday Next.

200 AZALEA MOLLIS and other Plants from Belgium, STOVE and GREENHOUSE PLANTS in variety; 150 lots of Home-grown LILIES, CALOCHORTI, CARNATIONS, and various HARDY BULBS and PLANTS.

Messrs. Protheroe and Morris will sell the above by auction, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on Thursday Next, October 26, at 12 o'clock.

Friday Next, October 27.

Messrs. Protheroe and Morris will sell by auction, at their Central Sale Rooms, 67 & 68, Cheapside, London, E.C., on Friday next, October 27, 1893, at 12.30 o'clock, by order of Mr. F. Sander,

ODONTOGLOSSUM LUTEO-PURPUREUM.

This is the most variable and productive of fine forms of all the species of Odontoglossum. Much might be written of the numerous varieties that have been considered worthy of special names...

The present is a good time to purchase. The plants are in capital order, and will begin to break very quickly. Odontoglossum luteo-purpureum has not been offered for a considerable length of time, and an opportunity like this to secure a good stock of such a grand, and easily-cultivated, and showy Odontoglossum, should not be neglected.

CYPRIPEDIUM ROTHSCHILDIANUM.

In fine order and con. tin. Oncidium Lanceum Superbum, very fine imported Plants, Cattleya Leopoldi, very fine.

COELOGYNE ASPERATA, C. DAYANA.

DENDROBIUM SPECIOSUM FROM THE GULF OF CARPENTARIA.

And many other valuable, established, and imported Orchids. On view morning of Sale, and Catalogues had.

SPLENDID BULBS FROM HOLLAND.

Sales every MONDAY, WEDNESDAY, THURSDAY, and frequently on SATURDAY.

In Large and Small Lots, to suit all buyers.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., first-class consignments of choice HYACINTHS, TULIPS, CROCUS, NARCISSUS, and other BULBS, arriving daily from well-known farms in Holland in the finest possible condition.

N.B.—None but good and reliable Bulbs will be offered.

Monday Next.

LAST SPECIAL SALE OF THE SEASON OF DUTCH BULBS, from Mr. H. HOMAN.

MR. J. C. STEVENS begs to announce that he will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY NEXT, a grand importation of BULBS, in splendid order, from Mr. H. Homan, of Novdijld, Holland.

Wednesday Next.

300 choice named Dwarf ROSES, a fine Collection of CARNATIONS and PICOTEES, and other Border Plants; 30,000 LILY OF THE VALLEY Crowns (Berlin), 1000 Clumps of LILY OF THE VALLEY, 1000 SPIRÆAS, a Consignment of AZALEAS and DRACÆNAS from Ghent, 5000 LILIUM HARRISI, 5000 TUBEROSAS, 10,000 Yellow CROCUSES, 20,000 SCILLA SIBIRICA, choice LILIUMS, &c.

MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, October 25.

Wednesday Next.

A Consignment of ROSE TREES, CLEMATIS, HYDRANGEAS, HOLLY TREES, RHODODENDRONS LILIUMS, &c., from Holland.

MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, October 25.

Tuesday and Saturday Next TWO SPECIAL SALES OF DUTCH and OTHER BULBS.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on TUESDAY and SATURDAY NEXT, October 24 and 28, at half-past 12 o'clock precisely, each day. Grand importations of Bulbs in the best possible condition, from several leading growers in Holland, and specially lotted to suit all buyers. French forcing Bulbs, &c.

On view morning of Sale, and Catalogues had.

Thursday Next.

A fine Collection of Established ORCHIDS, many in Flowers. MR. J. C. STEVENS will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, October 26, a fine and varied Collection of well grown Established ORCHIDS, chiefly in Flower and Bud, including some choice specimens.

On view morning of Sale, and Catalogues had.

Thursday Next.

GREAT TRADE SALE OF DUTCH BULBS. MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, October 26, at half-past 12 o'clock precisely, an enormous Consignment of DUTCH BULBS, specially lotted for the Trade and other large Buyers.

On view morning of Sale, and Catalogues had.

J. & B., formerly with Messrs. Protheroe & Morris. Thirteen years' practical experience.

Great Doods, Reigate, Surrey.

To ROSE GROWERS, HORTICULTURISTS, and Others. MESSRS. JOHN LEES and BURCHELL are instructed to sell by AUCTION, on the Premises, early in November, the important Stock of about 7000 EXHIBITION ROSE TREES, established by the late A. J. Waterlow, Esq., for many years one of the most successful exhibitors of Roses at the Crystal Palace and other Shows.

Also STOVE and GREENHOUSE PLANTS, SPECIMEN FERNS, FRUITING VINES, STRAWBERRY PLANTS, SHRUBS, &c. Offices:— 17, Wool Exchange, London, E.C.; and Reigate, Surrey.

Dorking Nurseries, Dorking.

Close to L.B. & S.C. and N.E.R. Stations. ANNUAL SALE of well-grown and healthy young NURSERY STOCK (in first-rate condition for transplanting), viz.:— Box, Hollies, Portugal Laurels, Arbor-vitæ, Common Yews, Flowering Shrubs in variety, Abies Douglasi, Pines and Piceas in variety, Herbers of sorts, Priver, and Rhododendrons, mixed Ivies, and other Climbers; Spruce and other Firs of various heights up to 10 feet (fine, for immediate effect), a quantity of Ornamental Trees, such as Poplars of sorts, Birch, Planes, Limes, Maples, &c. Choice Standard and Pyramid Apples, Pears, and Plums; healthy young Cob Nuts and Filberts, a quantity of Gooseberries and Currants, Laurels, various sizes; also a collection of strong Chrysanthemums and choice named Carnations in pots.

Messrs. WHITE and SONS will sell the above by AUCTION, under instructions from Messrs. Ivery & Son, on TUESDAY, October 24, 1893, at 12 o'clock precisely.

Catalogues may be obtained at the place of Sale; of Messrs. IVERY and SON, High Street, Dorking; at the Inns in the neighbourhood; and of the Auctioneers, Land Agents and Valuers, High Street, Dorking, and on Fridays at Leatherhead.

Cleeve Hill Nurseries, Exwick, Exeter.

Within a few minutes' walk of St. David's Railway Station. Sale of well-grown NURSERY STOCK, presenting to Gentlemen and the Trade engaged in planting a splendid opportunity of securing well-assorted and thriving Young Stock.

Messrs. HUSSEY and SON are favoured with instructions from Mr. R. Vanstone, who is relinquishing the business, to sell by AUCTION, on MONDAY, TUESDAY, and WEDNESDAY, October 23, 24, and 25, commencing each day at 11 o'clock, the whole of the extensive NURSERY STOCK, comprising:—Specimen Border Shrubs, in rich assortment; large quantity of Conifers of the choicest description and various sizes, a quantity of Evergreens, comprising Variegated and Green Hollies, Golden and English Yews, &c.; Ornamental Trees, Shrubs, and Climbing Plants; large quantity of Fruit Trees, including Standard, Dwarf, and Pyramidal Apples, ditto Pears, Peaches, Nectarines and Apricots, &c.

Catalogues can be obtained of the Auctioneers, 14, Queen Street, Exeter.

HIGHLY IMPORTANT NURSERY SALE, by AUCTION, at BELBRAE NURSERIES, CUPAR, by Mr. WILLIAM WATT, on MONDAY and TUESDAY, November 6 and next, owing to the natural Termination of his Leases, and the REMOVAL of his NURSERY BUSINESS to MIDDLEFIELD, comprising One of the Finest and Largest Selections of Forest Trees, Ornamental and Avenue Trees, Shrubs, Fruit Trees, Roses, &c., in great variety—all healthy, well fibred, and in excellent condition for removal to any climate, having been grown in exposed situations.

Sale to Commence each Day at 11 A.M. Catalogues will be Ready in a few days, and any information desired will be given on application to Mr. WATT, or the Auctioneers— Cupar, October 17, 1893. Messrs. LYON and TURNBULL.

Ottershaw Nurseries, near Chertsey, Surrey.

Messrs. WATERER and SONS have received instructions from Messrs. Fletcher Brothers (in consequence of the land being required for Building purposes) to sell by AUCTION, on Monday, October 30, 1893, and two following days, at 11 for 12 o'clock each day, the exceptionally well-grown NURSERY STOCK, in excellent condition for removal, comprising 8000 Choice Fruit Trees, Forest Trees, Standard and Dwarf Roses, Ornamental Evergreen Trees and Shrubs, including many fine Specimen Plants; 4000 Weymouth Pine, 1 to 10 feet; 1000 Caucasian Laurels, 50,000 Larch, 1 to 8 feet.

May be viewed seven days prior to Sale, and Catalogues obtained on the Premises, and of the Auctioneers, at Chertsey, Weybridge Station, and Walton-on-Thames.

CHRYSANTHEMUM EXHIBITION.

NORMAN DAVIS begs to intimate that his magnificent Exhibition of these popular flowers is now open, free of charge. No one interested in Chrysanthemums should fail to visit this, "the oldest and best trade show." (Open all Sundays in October for private inspection only.)

Notwithstanding the splendid Novelties distributed by me last season, and which are giving such unbounded satisfaction all over the country, I feel confident that the present season's Novelties will surpass all previous introductions. Scores of splendid Novelties in all fantastical shapes, and remarkable for their distinctness, are now opening.

CHRYSANTHEMUM NURSERIES, LILFORD ROAD (Near Loughborough Junction), CAMBERWELL, LONDON, S.E.

N.B.—500 Plants of the New "GOLDEN VIVIAND MOREL," and almost as many "WILLIAM SEWARD," are alone worth a visit.

ODONTOGLOSSUM CRISPUM ALEXANDRÆ.

BEST VARIETY.

GUILLERMO KALBREYER begs to offer the above well-known and justly-prized Orchid at the following prices, free on board of Royal Mail Company's steamers, at Savanilla:—£40 per 1000 good and healthy pieces.

G. K. also can supply:—

ODONTOGLOSSUM LUTEO-PURPUREUM, | CATTLEYA TRIANÆ, best variety, £8 per case.

„ CUSPIDATUM PLATIGLOSSUM, | Each case contains from fifty to sixty good, strong pieces, and measures about 20 inches by 34 inches.

£36 per 1000.

The plants are packed with the greatest care and best method, but under no circumstances will G. K. hold himself responsible for the state of plants on their arrival in Europe. *Conditions*:—All Consignments are shipped entirely at Buyer's risk and expense from port of shipment. Plants ordered must be paid for on receipt of bill of lading to Messrs. ROESING BROTHERS AND CO., 10, Basinghall Street, London, E.C., who will then give orders for forwarding the consignment to the Purchaser.

The best time for dispatching Orchids from here, and to establish them with the best advantage in Europe, are the months—December to April.

EARLY ORDERS INVITED.

A considerable reduction will be made on orders of 1000 and more of each kind of Odonoglossum, and on four cases and more of Cattleya.

Address:—G. KALBREYER, La Flora, Bogota, Republica de Colombia.

Cablegram Address:—FLORA, BOGOTA.

NEW AND CHOICE VARIETIES OF FRUITS

OFFERED BY

MESSRS. JAMES VEITCH & SONS.

APPLES.

ALBURY PARK NONSUCH.—A large, very heavy Apple, somewhat conical, with prominent ribs; of first-rate quality as a culinary Apple, and a good keeper. The tree is vigorous, and an enormous cropper. Award of Merit from the Royal Horticultural Society.

Dwarf Maidens, 5/-; Standards, 7/6; Pyramids, 7/6.

BEAUTY OF STOKE.—A large, conical, and evenly-shaped fruit, of an uniform brown russet colour, and of excellent quality. The tree is a good bearer, both as a pyramid and a standard. First-class Certificate from the Royal Horticultural Society.

Dwarf Maidens, 5/-; Standards, 7/6; Pyramids, 7/6.

MCINDOE'S RUSSET.—The fruit is large, and rather flattened with prominent ribs; of a brown russet colour, and of excellent flavour. The tree is of moderate growth, and an excellent bearer. This originated from the same source as the celebrated *Bismah* Apple.

Dwarf Maidens, 5/-; Standards, 7/6; Pyramids, 7/6.

WEALTHY.—A handsome, beautifully-coloured Apple of American origin. It is of good size, excellent for exhibition, suitable for the table, but, strictly speaking, a culinary Apple. The tree is of moderate growth, and an excellent bearer. Award of Merit from the Royal Horticultural Society.

Pyramids 2/6 to 5/-.

PEARS.

BEURRÉ DE MORTILLET.—A large and handsome fruit of obovate shape, 5 to 6 inches long; the flesh is white and pleasantly flavoured. It requires double grafting; it then forms a prolific bush or cordon.

Bushes, 3/6 and 5/-; Cordons, 2/6.

BEURRÉ FOUQUERAY.—A large and handsome Pear. The blossoms seem to resist spring frosts better than those of most varieties of French origin. The tree is a stout, sturdy grower and heavy cropper; it forms a good pyramid or cordon on both Pear and Quince stocks. First-class Certificates from the Royal Horticultural Society and at the Garden and Forestry Exhibition at Earl's Court.

Dwarf Maidens, 2/6; Single Cordons, 3/6;

Pyramids, 3/6, 5/-, and 7/6.

ALL OTHER NOVELTIES OF MERIT.

DESCRIPTIVE CATALOGUE of SELECT FRUIT TREES, post-free on application.

THE

Gardeners' Chronicle.

SATURDAY, OCTOBER 21, 1893.

THE PAST ROSE SEASON.

AT last we may write of the Rose season of 1893 as being past; we may, of course, if the weather be fine, gather a few blooms still, yet this notwithstanding, the glory and beauty of the season are over; and what a season it has been! Never since the memorable year of 1879 have the expectations of Rose growers been so hopelessly disappointed. During that year the daily downpour, the grey, dull days on which the sun never shed forth its light, created a state of things which will not be easily forgotten; good Roses were a scarcity, and many stands of flowers were so much below the standard, that the judges hesitated about giving them any award. This year there was much the same state of things, so far as the Roses south of the Trent were concerned, and the northern growers swept all before them. In February things looked well; the plants had gone through the winter fairly well; the continued rains of February had encouraged growth; and as the time for pruning came on, the shoots were evidently in good condition. But alas! after the wettest February we have known for years, there came that uninterrupted drought, which will for many reasons make the year 1893 a notable one; for, from the beginning of the month of March to the beginning of July, no rain of any moment fell, while a blazing sun rushed flowers into bloom long before their proper time—consequently, the blooms were small and deficient in substance, and it was only under the cooler skies of the North that Rose blooms of really good quality, size, and substance could be obtained; and this held good during the whole of the Rose season, for at the Royal Horticultural Society's show in the Agricultural Hall, Islington, on August 29, fine stands of Roses in good character came from Messrs. Cocker & Sons of Aberdeen; it is true that the 1st prize on that occasion was gained by a southern firm, that of Messrs. Paul & Son, but there was a substance and depth of colouring in some of the Scotch flowers which was very remarkable.

It is always a most difficult thing to accurately survey the Rose season, for in nothing else is the saying more true that circumstances alter cases. Temperature and climate vary so much in our islands, that what is true in one case is utterly incorrect in another. It is curious, for instance, to meet at the close of a season with a number of Rose-growers, and to hear their varying remarks. One man will say, "I never knew such a season as this;" while his neighbour will probably rejoin, "I have not seen one good Rose in my

garden, but then I have been greatly troubled with orange fungus;” to which another adds, “I have not had any.” The complaint of another grower is, “The season has been so dry that my Roses have made no wood;” while another adds, “I never had finer autumn growth, shoots 5 and 6 feet long.” But this year has certainly made a sharp dividing line; the story of failure that has come from the South of England has found no echo in the North. From the beginning to the close of the season, the northern growers carried the day; and, as a matter of course, the challenge trophies have gone in that direction; and although Mr. Lindsell managed to secure the Amateur's Trophy at the Crystal Palace, Messrs. Harkness & Son carried off both the Challenge and Jubilee Trophy; and the Amateur's Jubilee Cup went to their neighbour, Mr. A. Whitton, an amateur who has not been conspicuous for success before.

I believe that all those who have visited the Rose shows throughout the country agree in the verdict that Roses were everywhere of a moderate character; of course, there were exceptions, but these only proved the rule. Some facts were, however, noteworthy—one was that dark Roses, to the surprise of most persons, came out very well. The hot, scorching sun which we experienced for many weeks would, it was thought, have “burned them up,” but it was not so, such Roses as Horace Vernet and Prince Arthur being remarkably fine; indeed, it was said by some that no such blooms of Guillot's H.P. had ever been shown before. I recollect, however, a stand of it (Horace Vernet), shown some years ago at Farningham by the Rev. J. H. Pemberton, in which the blooms were, I think, quite equal to any of those exhibited this year. Bennett's Rose, Her Majesty, has again proved itself an uncertain doer, for grand as it was last year, it was not exhibited in anything like the same form this year. Mrs. John Laing, on the other hand, has proved itself to be a most constant and reliable flower; I do not think that the blooms exhibited this year have, however, been equal to some that I have previously seen.

It has been for the Tea Roses a most glorious season, but it is amongst the older varieties that we must still look for the gems of this class; indeed, there are not many new candidates for public favour amongst them, and it is difficult to conceive whence Roses are to be obtained that will excel some of those which we already possess. Marie Van Houtte has been exquisite this year, its soft creamy-yellow ground and pink edging to the petals having been brought out in great beauty; and, as I have already noted, a bloom of Madame Cusin exhibited by the Rev. A. Foster Melliar was of itself worthy of a journey to the Drill Hall to see. I question if Countess de Nadaillac had as much richness of colour as in some former years, but then Mr. Geo. Prince, who has always exhibited in such grand beauty, did not compete. Madame Hoste, which some have decried, asserted its place as one of the best of recent Tea Roses. I cannot alter my opinion about Ernest Metz; it is no doubt a very beautiful Rose, but seems especially to rejoice in the air of Colchester—and the rarity with which it was shown, and the absence of exhibitors in the class specially devoted to it, seems to me to imply that it is an uncertain variety. Jean Ducher, again, as might have been expected in so hot a season, was frequently and well shown, the weather being very favourable to the opening of so close and full a flower. Of Sappho and Waban not a great deal has been seen, but the blooms of the former seem to indicate a promising Rose.

It may seem a strange assertion to make, that in a year where three Gold Medals for new Roses have been awarded, there was a great dearth of novelties, nevertheless this was the case—for two of the medals were awarded to Irish Roses and the third to the fine climbing Rose Crimson Rambler, exhibited by Mr. Charles Turner; and in looking through the long list of H.P.'s and Teas sent to us from abroad last autumn, I do not see one which has made, or seems likely to make, any favourable impression upon us, and it is to our home-raised Roses that we are now especially looking. Messrs. Paul & Sons' Charles Gater is bright in colour, good in form and substance, but I fear it is rather small for the present taste. The two Irish Roses which obtained the Gold Medals, were Marchioness of Londonderry and Mrs. Sharman Crawford—the former white with a slight blush tinge in it, the latter delicate soft pink, somewhat of the shade of Madame Gabrielle Luizet, though differing from it in form and substance; and if these Roses are not Home-Rulers, and do not refuse to grow as well on English as on Irish soil, they will be found valuable additions to our exhibition varieties. From the long list of French varieties sent out last autumn, I do not think it is probable that there will be a single variety in either the Hybrid Perpetuals or the Teas which will hold a permanent place in our list; while of those of 1891 it is a question whether the same record will not have to be given. A very close and accurate observer, Mr. Pemberton, only mentions one Hybrid Perpetual, Madame Delille (Schwartz), which he considers worthy of a place. Whilst there are two Hybrid Teas which seem likely to be of service, the one as a button-hole flower, the other as an exhibition variety; the former of these, Gustave Regis, is of a beautiful canary-yellow colour, and has a long pointed bud, that will no doubt make it a favourite for button-holes, &c., although it is very questionable whether it will supersede that universal favourite, William Allen Richardson; the other, Caroline Testout (Rernet & Ducher), is spoken highly of, not only by Mr. Pemberton, but by that veteran and very fastidious judge, Mr. B. R. Cant. It is described as a light salmon-pink, large and globular, very continuous in blooming, as is the way with most of these hybrid Teas; but Mr. Pemberton gives the warning note that it has a defect which spoils many Roses, namely, that of coming quartered. I had intended to have said something as to some of the more remarkable records of prize-winners, and also of the autumn Roses, as well as of garden varieties, but I have outrun the limits of my space, and must reserve these for a future article. *Will Rose.*

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM × TENNYSON (*Ananthum Superbum* ♀, *Dayanum* ♂).

THE foliage of this new cross-bred is light green, with a fine dark green veining as in the foliage of C. × Ashburtonia. The flowers are as large as those of C. × Harrisianum, a light form of which they resemble in general appearance. The upper sepal is white, with a greenish tinge at the base, and some purple lines extending two-thirds of the way to the apex. The lower sepals are greenish-white, with a pure white margin. The petals are ciliate, of a pale rose colour at the outer, and a darker rose on the inner halves; the face of the labellum being of the same hue as the petals, and like them exhibiting a polished surface. The staminate node is clear yellow. The flower in elegance of form bears distinct traces of C. Dayanum. The

stock of the plant is in the possession of Mr. P. McArthur, The London Nurseries, Maida Vale, W. *James O'Brien.*

ORCHID NOTES AND GLEANINGS.

DENDROBIUM PHALENOPSIS SCHRODERIANUM.

THE consensus of opinion seems to point to the fact that this beautiful species is one of the best and most free-growing of Orchids; but while most growers have more or less success with it, some of them succeed in making it put on growths far superior to those on imported plants, and to bear, probably, better flowers than they do in their native land. One of the most successful cultivators of this species is Mr. G. Batbel, the manager of Mr. Whiteley's Nurseries at Millingdon Heath, Uxbridge, at which place a grand show of this species of Dendrobium may be seen at the present time. The flowers make a fine show, but to an Orchid-grower the stout pseudobulbs, clad with spotless fleshy green leaves, supply an equally gratifying sight. Many Orchids useful to the florist are grown at Mr. Whiteley's Nursery, and all of them are in fine health.

CYPRIPEDIUM INSIGNE SANDERÆ.

Another clear yellow and white form of C. insigne, very near to the original C. i. Sanderæ, has flowered out of an importation which Messrs. F. Sander & Co. have sold as *Cypridium iosigne montanum*. This latter species has produced many fine novelties, ranging from the beautiful C. i. Sanderæ (and this second form of the same section, which are as nearly albinos as the species has yet produced), and others which have almost black markings, with purple spots on the white upper third of the dorsal sepal. As an imported plant it was bought with others at Messrs. Protheroe & Morris' rooms for a few shillings, and its lucky possessor got 23 guineas for it at the same establishment on Friday, October 13, as a plant in flower, in an unreserved sale.

MILTONIA SPECTABILIS MORELIANA VAR. ATRO RUBENS.

Probably the best variety of this remarkably showy Orchid is now to be seen in flower in the collection of W. Cobb, Esq., Dulcote, Tunbridge Wells. It was received as an imported plant two or three years ago, and it is therefore distinct from the original stock, to which it is far superior. Its large flowers have shining wax-like sepals and petals of the darkest maroon-purple shade, except a small area around the column, which is of a bright rose colour. The large flat labellum is 2½ inches wide, of light rosy-purple colour, darker at the base, and with several dark purplish-crimson lines extending from the base to the margin. The column and cup are pure white, and the wings purple. It is a beautiful, distinct, and striking Orchid. *J. O'B.*

CATTLEYA LABIATA.

I see that attention is now drawn to the flowering of the two great importations of *Cattleya labiata autumnalis*, viz., “Warocqueana,” by L'Horticulture Internationale, and that by F. Sander & Co. I have several of both flowering freely, and amongst mine the light varieties are in great preponderance. The dark ones are few, and very handsome; and I have one of Sander's of very great beauty, extremely deep and rich in colour, with the lip extremely convolute, and beautifully fringed. *H. J. Ross, Poggio Gherardo, Firenze.*

WEXHAM PARK.

THE Slough district is rich in beautiful gardens. It is a favoured radius that stretches 6 or 7 miles around this quiet English town, and the gardener, or whoever he may be, that wishes to see many good places, could not find a happier hunting-ground. The scenery is full of quiet beauty, and splendid views are got from the more hilly spots. In the neighbourhood, so to speak, of Wexham Park

may be named the Royal Gardens at Windsor, Dropmore, Cliveden, Langley Park, Stoke Park, Stoke Farm, Ditton Park, and many others. Not the least of this famous throng is Wexham Park, near to the quaint church of Stoke Pogis, where the poet Gray is buried.

The surroundings are thoroughly English, and it is difficult to realise that the great metropolis is but a few miles distant.

Wexham Park is the residence of Sir Charles Pigott, Bart., and a good English home. It commands beautiful views of Berkshire, the eye stretching to Windsor Castle and Windsor Forest. To horticulturists it is famed for its gardens. They are not so

pitch of perfection. Everywhere Mr. Ford seems victorious with his plants, and deserves success. His *Cinerarias* were in particular remarkably fine, but then this is quite a *Cineraria* country, as Farnham Royal, the nursery of Messrs. J. James & Son, so successfully managed by the late Mr. James' son, is only a mile or two away. A distinctive trait is conspicuous in the plants. They are of very dwarf habit, quite compact, neat, and the masses of flowers are produced in a dense head close down upon the leafage. The colours are superb; one cannot help comparing some strains with those one sees here and at Farnham Royal, the colours not spoilt by bizarre association of various shades, but distinct, rich, and as

stove and other plants grown here, nor the fruit department, which is naturally a feature of interest, but in this respect one garden is much like another.

TUBEROUS BEGONIAS.

At the Chiswick show in July last, Mr. Ford exhibited several tuberous *Begonias*, which were amongst the finest we have seen this season, and caused general remark at the time. Those interested in *Begonias* will find Wexham Park a veritable storehouse of the brilliant flower, both inside and out of doors a kind of Hulton, although not on such an immense scale. During the summer months the beds are bright with many things, but chief amongst

FIG. 51.—VIEW OF WEXHAM PARK, STOKÉ POGIS.

remarkable for size, as for perfect order, and that in the various arrangements artistic effect is not sacrificed to mere petty details. It is a garden that in the fulness of summer is beautiful, not to say picturesque, which is owing partly to its bold situation and the free planting of certain things. We visited this spot when the *Cinerarias*, *Calceolarias*, and other florists' flowers of the season were in beauty. There are many good glass-houses in the garden—in fact, it is especially noted in this respect, and the utmost use is made by Mr. Ford, the head gardener, of the means at his disposal. Visitors to exhibitions in the spring months know that fine plants are grown here, and of true exhibition character. The specimens are a picture of superb health and splendid colouring, the outcome of a "strain" raised to the

pleasing to the artist as to the gardener. The same high character that stamps the *Cineraria* is seen also in the herbaceous *Calceolaria*, Chinese *Primula*, Persian *Cyclamen*, and every florists' flower that is cultivated. In these days it is rare to visit a garden where such plants as those mentioned are grown with conspicuous success, and the greenhouse, too, is deprived of their assistance in forming gay blocks of colour to attract the visitor. We think it is a pity that the stove and greenhouse plants one used to see in days gone by are now comparatively rare in gardens. The gardens, now-a-days, in which they are well cultivated, may be quickly counted, and certainly amongst them Wexham Park may be named.

It is unnecessary to enter at length into the many

them is the fine strain of this flower which has been raised to perfection here. Many of the seedlings are superb for the size, finish, and colour of the blooms. On one occasion last year, if we remember correctly, at the show of the Maidenhead Horticultural Society, no fewer than seven were awarded First-class Certificates. It would be well if we saw more of them at London shows, those of the Royal Horticultural Society in particular, that one might know of the rich treasures found in this garden. This year, although the weather has been much against tuberous *Begonias*, they have succeeded well, but last year were even better, maintaining their high character from early summer until frosts stopped their career. One may judge of the effect produced when the plants fill two houses, one a span-roofed

structure about 50 feet long, and the other a three-quarter span, 36 feet in length. Robust health is observed in every specimen, and the flowers are invariably of great width, although not coarse. As I am writing of a garden of florists' flowers, I may mention that size is not everything in flowers, and hope Mr. Ford in his efforts to still further enrich the tuberous Begonia, will not sacrifice beauty for mere size. A medium-sized bloom of clear, distinct, and pretty colour, is far preferable to an enormous one which may call forth surprise for its dimensions, but is not beautiful.

The plants are cultivated in comparatively small pots, very few in those larger than 8-inch, the majority in 48's or 32's. But they are true specimens, 2 to 3 feet across, and profusely flowered. The seed is saved from plants selected by Mr. Ford; and a rigid rejection of all forms not attaining a certain standard of excellence, has resulted in the fine strain one sees in these houses. Seed sowing is done in the early spring, and the seed only lightly covered with the compost, which is made up of loam, leaf-mould, and coarse silver sand in equal parts. When the young seedlings are of sufficient size to handle they are pricked out in other pans, and a warm, moist temperature afforded. It is of the utmost importance to place them near the glass, otherwise the growth gets drawn, and the naturally bushy habit of the plant spoilt. A great change has come over the tuberous Begonias in growth. A few years ago it was tall and spreading, but now is exactly the reverse. As spring departs, the plants are gradually hardened-off, until in a condition to be transferred to frames, where they are kept close to the glass, and carefully tended. When all danger from frost is over, the plants are put out in a rich, thoroughly well-prepared bed in the kitchen garden, and here they flower. It is pleasing to see large numbers of seedlings showing a great range of lovely colours, some identical with those we already have, others displaying a new departure to be at once seized upon, as the possible progenitors of another section. Those selected are carefully noted and grown on for another year.

Every department is well managed, and the gardener in the neighbourhood of Wexham Park will learn much by a visit paid either in the late spring when the florists' flowers are in perfection, or in the summer. He could spend a few days in the neighbourhood, not forgetting to visit Dropmore, which in the spring is a revelation of glorious colours from the breaks of Rhododendrons and hardy Azaleas, that light up the scenery with brilliant colours, and spread around a spicy fragrance. Not far distant from Wexham Park is Burnham Beeches, and during the summer months an omnibus meets the London trains and conveys visitors to this lovely spot in hilly Buckinghamshire. *Visitor.*

HARD-WOODED GREENHOUSE PLANTS.

For years past it has been customary to the trade to order the quick-growing *Ericas*, and several other Cape and New Holland plants, in large numbers during the autumn season. These plants usually change hands in the first instance towards the end of September, when they are purchased largely by nurserymen, being again distributed in due course to private growers in smaller quantities. Those who purchase in the first instance in large numbers are more often alive to the peculiar treatment these plants require, as they are oftentimes departmental men; but when the plants are afterwards "sent out," their culture is not so fully understood as it should be by private gardeners—consequently, the promising appearance the plants may have, does not endure long enough to obtain the best results from them.

As a case in point, we would quote the *Ericas* in the first instance. *E. hyemalis*, it is known, is grown in as large quantities as any winter-flowering Heath, but the very promising look these plants assume during September and October does not last in many cases. For this there must be an expla-

nation. In the first place, this variety is a vigorous grower under liberal treatment, and as the pots are never of excessive size, it follows that, in the case of healthy plants, they are tightly filled with a mass of roots. This causes the soil and plants to dry up quickly, far more so than some would imagine. To allow them to suffer, or even approach that state, is decidedly injurious to the flowers in whatever stage they may be. When the plants have thus suffered, the result will be seen in numbers of yellow buds in various stages of development, which eventually die. Others, which may have reached more nearly to perfect flowers, become crippled, and consequently look badly when expanded. This is occasioned by want of water more than anything else, as has been proved over and over again. There is also another important fact to be borne in mind, which is not generally known; some of the large growers are in the habit of feeding their plants artificially with weak solutions of sulphate of ammonia, or other exciting chemical compounds. In looking through a large stock a few days back, the difference in the appearance of the plants of *E. hyemalis* was most noticeable; these, be it observed, had been grown by various cultivators. Some were of a deep green colour and extremely vigorous, as well as of sturdy growth, betokening good management. Others had less of this appearance, but still showed signs of liberal feeding. The appearance of both of these batches could be clearly traced to something more than clear water, and nothing is better suited to develop a deep green colour than sulphate of ammonia. Another lot of plants in the same place as the foregoing were of a paler colour, but betokened a hardihood which would stand them in good stead. If I were purchasing a stock of this *Erica* I would at once take them from the last-named batch, although they were not so large or of such a dense growth, as they would be much more likely to succeed for several seasons than the others.

When such plants change hands, there is constant need of close attention to the watering; the plants should at any rate be looked over twice a day, and when watering is done, let it be thorough. I would not advise the continued application of the chemical alluded to, but substitute in its place a weak solution of soot-water for a time.

Erica gracilis autumnalis is now flowering most profusely, I never saw it better than the other day in the same establishment as the foregoing. The plants were of extra size, but in remarkably small pots, and the blossoms very highly coloured, the result beyond doubt of the sunny autumn weather. I also observed that *E. Wilmoreana* was further advanced than is usual at this season. This variety wants just about the same kind of treatment as *E. hyemalis*, both being of dense growth, with the possibility of an attack of mildew coming on if wintered in a damp house or crowded. This crowding is a decided evil, and one that should be carefully avoided. It is much better to elevate the plants on pots, with dwarfers ones around them, than to mass them together. *E. mammosa pallida* and *E. verticillata* are two beautiful autumn Heaths, so also is *E. cerinthoides*, but none of these will take so much water as the two former kinds, they being of a more wiry growth with less foliage to support on the whole. With other *Ericas* the same close attention is needed, as in the case of *E. Cavendishiana*, which as a market plant is more largely grown than ever it was. In no case should potting be thought of after the plants are received. This work must be deferred until the flowering season is past, and growth again commencing. One point, however, is worth noting in the case of *Ericas*, which do not flower on the extremities of the shoots, such for example as *E. hyemalis*, which should be clothed with flower nearly up the entire length of the shoots, except where the growth is too sappy. In these cases, pinch out the points of the leading shoots, when their growth is seen to be progressing too fast. Any of these *Ericas* that have been alluded to should now be housed, or at any rate have glass placed over them at night, in case of frost. So long, however, as the temperature does not fall below 35° no harm

will be done. When housed, the ventilation should be free, otherwise the plants will feel the change from the open air, to which they have been for months subjected. *H.*

(To be continued.)

PLANT NOTES.

AMPELOPSIS VEITCHI VAR. PURPUREA.

As this comparatively new climbing plant becomes better known, it will be as much planted as *A. Veitchi*, which it resembles in every particular except the colour of the foliage, which is distinctly purple, as the name implies. Planted against the south and west walls of Longford Castle, the effect produced at the present time is very striking. *W.*

LUNARIA BIENNIS.

This erect-growing leafy biennial plant, commonly known under the name of Honesty, attains to a height of 2 to 3 feet, according to soil and climate, and is furnished with terminal racemes of purplish flowers, resulting in the production of oblong seed pods, which, when the husks or valves have fallen off in autumn disclose silvery transparent partitions, which remain firmly attached to the stalk. These flower-stalks are useful for house decoration in the winter and spring months. The plant is easily raised from seed sown in any kind of light soil out-of-doors early in April. The plants may be thinned out and allowed to stand at 6 inches apart, or be pricked out in reserve beds, finally planting them out in September or October. *W. H.*

DIMORPHANTHUS MANDSHUBICUS.

The above is a handsome subtropical plant for beds and shrubberies. Its large bipinnate leaves make it distinct from most other shrubs, and it forms a very pleasing contrast to them. When it has attained 8 to 10 feet, its natural height, its stems have a somewhat bare appearance, and on this account the plants should be dotted amongst lower-growing subjects, or planted at the back of the borders. At Wentworth Woodhouse it is planted in various positions, and unfortunately these not always the most suitable; for instance, in the front of taller shrubs, where in winter they have an unclothed appearance. It is very hardy in Yorkshire, having withstood the rigour of many winters, and has flowered profusely and matured its seeds this year. *T. H.*

THE HARDY FRUIT CROP.

ONE of the most remarkable circumstances of the driest summer on record, has been that the hardy fruit crop, and I refer specially to Apples and Pears, has been not only a remarkably abundant one, but also has promoted size and finish to fruit, beyond almost all precedent. The season has demonstrated the immense value of heat as a fruit-growing and developing force, and indeed, shows that it is of more importance than root-moisture. I do not, in saying so much, judge by what may have been seen on specially cared-for and perhaps watered garden trees. I refer to the produce of trees generally, such as I have seen in various parts of the kingdom, and grown in diverse ways. Apples and Pears have, for size, finish, and colour, proved distinctly a record year; that cracks, canker, and other ills have been singularly absent, and it does but serve to show that whilst the bulk of the ills that come to our hardy fruit trees and their produce comes from cold, heat on the other hand is capable of developing all the best properties in trees and in fruit. The recent hardy fruit show at Earl's Court was specially noteworthy, because it showed Apples and Pears even considerably in advance of what was seen a few years since in the Guildhall, and in the finest and most perfect form ever presented anywhere, and at any time. I merely refer to this fact in support of my proposition, that sun-heat [together with sun-light] is the great factor in fruit production, but on the same ground the assertion on general results. But

a remarkable fact still further is this, that whilst fruits have come of such great size in a year of comparative drought, yet, in many cases, the loss of weight seems to be excessive. This has been specially noted in the case of very fine Apples and Pears, which have wasted to the extent of several ounces after being gathered a couple or three weeks. Naturally it may have been expected that fruit grown under such influences would have been of a more solid description than where the trees were

although that proposition may be contested, yet it is an undoubted fact, that all our finest-flavoured Apples show little colour, and when colour is specially prominent on them, then is flavour somewhat deficient. Even the big Onions of the day, the giants of the *Allium tribe*, grown after such considerable pains have been taken to render them huge adipose bulbs, attain to that size at the expense of flavour and solidity of flesh, for they, too, lose weight rapidly after being stored. There is

a tree of same size and variety which produces 200 fruits that are of more than double the average dimensions. The plea that the finer sample sells best, and more readily fills the bushel, deserves all consideration, but it is not possible to put out of sight the important fact that after all, these things are grown for food, and if they are not, they are hardly worth troubling about. We must not hastily assume that the remarkable fruit development found this warm season indicates absolute advance in hardy fruit production over that of the Guildhall show year. We may have several seasons to follow of an average character, and these will bring down fruit to average dimensions. It is true that we have added some varieties to our Apples and Pears since that year, but not many, and comparatively few of these are of a specially firm or long-keeping character. It is very doubtful, after all, as to how far such exhibitions as those referred to help in the cultivation of the firmer and best-flavoured and best-keeping varieties. We have far more than is needed of autumn and early-winter Apples, soft of flesh, if big in size, and handsome to look upon; and these gain the attention that the less conspicuous sorts most clearly merit. *A. D.*

ZYGOPETALUM (WARSCWICZELLA) LINDENI.

This rare species, certainly the most beautiful of its class, and a worthy companion to the pretty *Zygopetalum Lindenii*, illustrated in the *Gardeners' Chronicle*, February 6, 1892, always finds admirers whenever it is exhibited. At the meeting of the Orchid Committee of the Royal Horticultural Society on June 7, 1892, it was unanimously awarded a First-class Certificate; and the appearance of the plant among the rarities shown by Messrs. Linden at the meeting in the Drill Hall on October 10 last well sustained the award previously made, its chaste white flowers, with purple lines radiating from the base of the lip, rendering it a very handsome variety.

It was introduced by Messrs. Linden, *Horticultura Internationale*, Parc Leopold, Brussels, and a good illustration was given of it in the fourth part of that excellent work, the *Lindenia* (English Edition).

NURSERY NOTES.

COLCHICUMS AND CROCUSES AT LONG DITTON.

THESE beautiful bulbous flowers were a few days ago in beauty in Messrs. Barr & Sons' nursery at Long Ditton, where a large collection is grown. It is only in such a place as this that one sees these fine bulbs, and English gardens lose greatly in interest by not being more liberally planted with the best species and varieties. They are in perfection at a time of year when the garden is fast going to decay, and properly planted they are not hurt by autumn winds and rains. It is a mistake to plant either the Colchicums or the autumn-flowering Crocuses, for instance, on a plot of ground much exposed, or without a creeping plant of some kind to cover the surface, and prevent the rain from splashing and destroying the beauty of the flowers. Also when planted upon rockeries, the more sheltered spots should be chosen. The bulbs at Long Ditton fill many large beds, and in the sunshine of a late September or early October day, they create masses of colour. The chief species is *Colchicum autumnale*, which goes by the name of the autumn Crocus, although it is not a Crocus. Of this species there are many varieties, both double and single, as indicated by the varietal name. *C. roseum* has rose-coloured flowers, album pure white, but the double forms are remarkably beautiful, plenum, Lilac, and the double white in particular; the latter a lovely flower, and as yet very little seen outside a large nursery or botanic garden. Such bulbs should be plentiful, as the flowers are not only perfectly double, quite a large rosette in form, but of the purest white. The double varieties are not so suitable for planting amongst grass as the single kinds, and should be reserved for the rockery, or the margins of shrubberies, where heavy rains can

FIG. 85.—ZYGOPETALUM (WARSCWICZELLA) LINDENI: WHITE, WITH PURPLISH STRIPES ON THE LABELLUM.

supplied with plenty of root moisture. But then it is invariably found in the case of Apples and Pears grown under glass, that these fruits so fine and so delicately coloured, are relatively soft and light, leading to the inference that the flesh has been too rapidly developed, to have that solidity and endurance so essential to good keeping and usefulness. Colour in this season beautiful, and rich almost beyond precedent, but colour never indicates flavour, and seldom solidity of flesh. Colour seems to be generally created at the expense of quality, and

hardly a case of any vegetable product where great size for the kind or variety does not mean a very great percentage of water in their composition, or else such thin cellular tissue that shrinkage soon follows. Mere size in anything does not indicate a relative quantity of food or nutriment. It much more frequently means a percentage of water, and no more. Yet there are plenty of people who will almost worship size, under the impression that it is all gain. The Apple tree that produces 500 clean, fair-sized fruits, furnishes more real food than does

have little effect upon them; the heavy blooms are soon dashed to the ground. *Colchicum speciosum* var. *rubrum* is a fine form, the flowers of a ruby-crimson colour, and large; and another conspicuous variety of this species is *Sibthorpi*, the segments chequered with a purple-rose colour. *C. Bivona*, lilac-rose; *C. byzantinum*, rose; and *C. variegatum*, sometimes called *C. Chionense*, are also fine species, which will be in all collections at all representative. *C. Parkinsoni* is remarkably distinct, conspicuously chequered with purplish-violet. The single species are well fitted for naturalising in the grass.

It is curious that the autumn Crocuses, which offer such a variety of colours, and are as easily grown as the more common Dutch kinds of spring, are really quite rare in gardens. Even that fine flower, *C. speciosus*, is little seen, but a more beautiful autumn-flowering bulb it is difficult to find. When seen in a large bed, the colour is superb, the flowers expanding widely in the sun, and displaying the orange stigmas, very brilliant against the purple segments. This species should be planted in quantity in the grass, in clumps on the rockery, and in the border, as it is less apt to get knocked about by rains than the heavier-flowered *Colchicums*. There are many species and varieties, and the flowering season commences in August, continuing until quite the end of autumn, when the winter-blooming kinds expand their flowers to the sun. Amongst the finer species worthy of attention, other than *C. speciosus*—the most useful of all, are *C. cancellatus* and its varieties, such as *cilicicus* and *Mazziaricus*; *C. medius*, one of the most easily grown of the genus; *C. ocbrolencus*, *C. pulchellus* and its pretty variety, *albus*; *C. Salzmanianus*, *C. serotinus*; *C. Tourneforti*, and *C. sativus* and its varieties. It is especially necessary not to plant the finer kinds except with some green-leaved plant for contrast. Against the bare earth they stand little chance in the autumn, and the colours are so delicate that they are quite lost. There is so much beauty in the *Colchicums* and Crocuses of autumn, as one may see at Long Ditton, that it is to be hoped they will be grown more liberally. *Visitor*.

PRUNING OF FRUIT TREES.

WHERE it is intended to have fruit trees growing in a comparatively small space, and which it is desirable to keep dwarf, a special system of pruning is necessary, and the object would be to get growing branches nearer to the ground, and not up in the air a long distance, where the trees would make large spreading heads. In order to accomplish this, one has to prune out, during the summer, most of the strong and vigorous growths at the apex of the plant, so as to throw the course of the sap into the branches near the ground; for, in a state of Nature, the tendency of the tree is to go up, and to go up as rapidly as it can, and the upper branches are, therefore, the strongest, and the lower branches are the weakest. To cut the strong ones out, therefore, strengthens the lower ones. It is on the same principle that we prune hedges. These we wish to keep low, and for this reason the plants are pruned in the summer time. The strong, vigorous branches—the top of the hedges—being the ones cut out; and this throws the sap into the branches near the ground, thereby strengthening them and making them of equal growth with those at the apex, and this work has to be done during the growing season. If the same kind of pruning were done in the winter time instead of the summer, the result would be that in the next spring innumerable strong shoots would push out where the upper ones are cut off, and growing so strong they would absolutely draw the nourishment from the lower branches. The pruning has to be done in this case while the sap is in vigorous circulation, so that the channel may at once be turned into these lower branches. One might take up any number of questions of trees in detail—Apples, Cherries, Plums, Grapes, or whatever it may be—and the lesson is just the same for

all of them. If you want to keep trees dwarf, with abundance of good growing branches near the ground, cut out all the strong shoots at the apex during the growing season. *Mechan's Monthly for October*.

TREES AND SHRUBS.

CLETHRA ALNIFOLIA.

THIS fine old shrub is rarely planted, as is the case with many others that are good and worthy of more attention. I recently met with several good bushes of it in an old-fashioned garden, where the rarer kinds of trees and shrubs were planted half a century since. Some fine examples of *Clethra alnifolia* were in August loaded with fragrant white blossoms. It is a very hardy plant, and grows freely in good loamy free soil. *W. D.*

TAMARIX GALLICA.

THE Tamarix is seen more or less all the year in bloom even by the seashore, where it grows best, and both at Eastbourne and at Folkestone a few days ago, we saw several large bushes covered with their pink-coloured flowers. When in flower this graceful shrub is remarkably beautiful, the feathery growth smothered with pink flowers, making a perfect picture, rare because, as a rule, the shoots are pruned away. It is not until the shrub has grown several feet that it blooms freely; and especially at seaside resorts, it is made into hedges, and gets clipped closely with the shears. It would be well if the Tamarix were allowed to develop its natural beauty, and there are certainly few more graceful shrubs for clothing a dry bank. In inland places I have sometimes seen a splendid treat of Tamarix in bloom. *J.*

PYRUS MALUS BACCATA.

THIS is a year for hardy fruit of all kinds. The various kinds of Crab are remarkably beautiful, and those that seldom fruit freely are breaking down with their heavy burdens. Many of the Crabs require a very hot season for them to fruit freely, and in France they attain greater beauty than in our colder and more changeable climate. For England the most useful is *P. malus baccata*, more generally known as the Siberian Crab, which is an exceedingly graceful and shapely tree, very hardy, and even in comparatively poor years, freely laden with the neat little fruits. Every branch is however this season, about breaking down, so heavy is their crop, which will make a gay effect in the garden through the early winter months. This tree is beautiful in bloom, in fruit, and at all times for its graceful habit of growth. *J.*

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

WALL TREES: RED SPIDER AND BLACK-APHIS.—The Peach, Nectarine, Morello Cherry, or any other fruit trees trained on walls, which are infested little or much with red-spider or aphid, should be well syringed with Gishurst's Compound, or any other well-known insecticide. To a 24 gallon tank of water, in which Gishurst's Compound Soap, at the rate of 4 oz. to the gallon, has been added, put half a pint of petroleum, being careful that the petroleum is well mixed with the Gishurst during its use. Having syringed the trees with this mixture, allow it to dry on the branches, &c., and the following day begin to syringe it off with clear water, and repeat the operation for two or three days in succession. By so doing, spider and aphid will be destroyed before the insects seek warmer quarters on the approach of frost, and where they are more difficult to dislodge.

RASPBERRIES.—Whilst Raspberries on a deep holding soil will continue to make good canes and yield satisfactory crops of fruit for many years, in shallow and less favourable soils they will, after

being planted eight or ten years, exhaust the soil very much, and make poor canes which bear unsatisfactory crops, in spite of the application of rich top-dressings. At this season fresh ground should be prepared by deeply trenching it and working into it a large quantity of manure; and unless the ground is naturally of very good quality, add sufficient suitable fresh soil. With this kind of treatment of the land, the Raspberry-canecan will last in a good cropping condition for a number of years. Should the staple consist of stiff soil, the scrapings of the road which have laid in a heap for at least twelve months, burnt garden refuse, and old mortar are the best ingredients that can be used to bring it into condition for the Raspberry.

PLANTING.—Providing the ground is in suitable condition without further preparation, the planting of fruit trees and bushes may at once be begun, but if preparations have to be made, it is better to leave the land till such time as it has been sweetened and pulverised by frost, the planting being undertaken as soon after January is out as the state of the weather will allow. If Raspberry canes are to be trained to strained wire, the rows should be 6 feet apart, and the canes 18 inches. This is a commendable method if properly constructed trellises can be put up; still, I consider that fastening canes to stakes a better one, there being little expense connected with it. In this case the stools may be 6 feet apart from row to row, and 4 feet in the row. The stakes being placed at the proper distance apart, plant three canes triangularwise, tying them loosely to the stakes, and afterwards mulch the land with the spent materials of hot-beds. Obtain the canes from a healthy stock. From my experience with the new variety, *Superlative*, it cannot be too strongly recommended.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

WORK IN THE HOUSES.—Active growth will now be nearly over, and as the season passes, with shorter days and less light, and more artificial heat required, a slight reduction in the temperature will be needed in most of the houses; less moisture also, so as to cause no more excitement than is really needed. Spot on the leaves is caused, very often, through over-moisture; it causes the foliage of the plants to be very sappy, and any check then produces spot, especially with the East Indian species, such as *Acriides*, *Angraecums*, *Phalaenopsis*, &c. The fine sunny days we are getting at present causes the temperature to run up very high during the day. Whilst I write these notes, the blinds, even on the Cattleyas, are lowered during the few hottest hours, from 10.30 A.M. to 1 P.M., when they are drawn up, and the houses well damped. I make a practice of walking through the houses on bright mornings, and if when I feel the leaves of the Cattleyas they are very hot, it is much safer to use the blinds, and even now, on looking through the plants, we find some have got scorched. The high temperature, also, will cause some to start into new growth again which should be going to rest, such as *Phalaenopsis*, &c. If any of these have started a new leaf, let them be placed in the warmest corner of the house, and have every encouragement to make it up as quickly as possible. In fact, there may be a number of plants in this stage which will require all the attention that can be given them to finish growth before the cold short days set in. The majority, however, are finishing their growth, and must be kept rather dry at the roots, but on no account let them suffer for want of water, as these plants have no pseudobulbs to fall back upon, so that any lack of water will soon cause the lower leaves to turn yellow and fall off. Give as much bottom ventilation to these as is really safe, to make the leaves as firm as can be done before hard forcing has to be resorted to. *Oncidium ornithorynchum*, *O. album*, and *O. incurvum*, will finish flowering and start into new growth, and any that need potting or re-basketing should be done as soon as flowering is over. We find these do best in Teak-wood baskets hung close up to the roof-glass. A good potting material for them is about equal parts good peat and sphagnum moss. *Cattleya crispata*, *C. lobata*, and *C. intermedia* will now be starting new growths, and should be kept carefully watered until the growths get away and begin to make new roots from the base; after that, they may have much more water supplied to the roots. These plants should be placed at the warmer end of the Cattleya-house. *C. Lawrenceana* should by this time be partly made up, and will take a good supply of

water at the roots, always allowing the plants to get fairly dry before applying more, as a constant supply sometimes turns the potting material sour. *Cattleya exoniensis* should be about finishing the new pseudobulbs, that will flower later on. Let this species be watered sparingly from now until the flower-buds can be seen in the sheaths, when more water may be applied; for if kept too wet they may start into growth again, instead of flowering.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

VINES.—An examination of the bunches still hanging should be made two or three times each week, removing all which show signs of decay. Black Hamburgs are among the first to suffer, and as they are valued more than any other variety till the end of the year, they should receive special care. Do not admit front air during damp or foggy weather, and the pipes should be warmed a little daily, to drive out damp, which will be assisted by opening the lights at the top of the structure. Remove all laterals, and shorten back any shoots which are green at the ends. A little fire-beat with a circulation of air are the means necessary to ripen any still immature wood. Pot Vines should now be made ready to start in a mild temperature; put them under cover, and examine the drainage, carefully removing the surface-soil with a pointed stick, which should be replaced by a mixture of good loam, with a little of Thomson's Vine-manure added—put on when somewhat dry, and made firm. If the roots are dry, they should receive a good watering. If any wounds have been made by shortening the rods, a dressing of styptic should be rubbed into them, to prevent bleeding when the plants are put into warmth.

FIGS.—All trees which have done fruiting should be allowed to rest as much as possible. If any root-manipulation has to be performed, it must have prompt attention. Fibrous roots should be encouraged, and it may now be necessary to lift and replant the trees in firm calcareous soil. Remove all useless wood, to admit light and air; crowding being a precursor of fruit-dropping. Those plants standing in pots or tubs may require checking at the root when they have grown into rich soil. The plants should now be well-ripened and ready to rest, by being kept rather dry at roots with abundance of air. Those which are forced early in pots, should be treated as recommended for Vines in pots, and rested till December, but prepared now for forcing.

PEACHES AND NECTARINES.—New plantations may be formed, and if there are trees on open walls which can be transplanted, an advantage will be gained. Young trees which may have grown too vigorously should be carefully lifted, the large fibreless roots shortened, and the roots replaced in good loam, mixed with some lime rubbish, and made firm. Trees for early forcing should now be ready for starting, but for the present kept dry and cool. It was an old practice to take the lights from off the trees, but few modern houses admit of this being done. When planting trees for early supplies on thoroughly-drained borders, a careful selection should be made, in order to have a succession of fruit. Hale's Early and Dr. Hogg for 1st and 2nd; Noblesse, Grosse Mignonne, and Royal George, which ripen nearly at the same time, are all good for a 3rd. Elruge and Rivers' Orange we have never found to fail when forced early.

THE FLOWER GARDEN.

By T. H. CRASP.

LILIUM CANDIDUM, ETC.—This beautiful old white garden Lily always moves with least injury at this season, and no time should be lost in doing this if the bulbs have become crowded, or it is desired to remove them from some other cause. The same will also apply to Crown Imperials, taking special care not to injure the bulbs in the process. Plant any fresh bulbs of these; they are noble plants for spring flowering, and always please, especially the variegated variety. The bulbs increase rather slowly, but they can easily be raised from seed, and with a little attention good flowering bulbs may be obtained in three or four years. The seeds should be sown now in well-drained pans or boxes, and placed in a greenhouse or frame where frost is excluded.

THE ALPINE GARDEN, especially where any choice species are grown, should receive a careful mulching after the decayed leaves are removed, for many plants will be found to have grown out of the soil. The most suitable compost is well-decayed

leaf-soil and peat, with the addition of a little sand. Some of our beautiful little Saxifrageas, as *S. Burseriana*, *S. Boydi*, *S. oppositifolia*, and vars., will be greatly benefited by working a little of the compost among the rosettes. As a general rule, the alpine garden is very liable to get neglected at this season. A careful look-out should be kept for slugs, &c., otherwise great havoc may be done. Some of the very choice kinds should be protected from heavy rains, which can easily be done with a sheet of glass or piece of slate being so placed over them that air can have free access, but the rain be thrown off.

CANNAS.—These ought to be lifted before severe weather sets in. Leave a little of the soil of the beds on the roots, and after being dried somewhat, place them closely together in a shed or cool cellar, and lightly cover with dry soil or sand. In warm localities where the soil is of a gravelly nature, Cannas may be left undisturbed, if protected with a mound of coal-ashes. The easiest course, however, is to lift them and store where frost or much damp cannot reach them, treating similarly such plants as *Salvia patens*, *Verbena venosa*, &c.; but it is best to place these latter in boxes, so that sufficient water may be given to prevent the tubers from shrivelling.

CENTAUREA CANDIDISSIMA.—This well-known plant, so useful for bedding, should now be taken up and potted, and wintered in a house safe from frost, giving it no more water than is sufficient to keep the roots fresh, and removing the old leaves as they decay. Plenty of cuttings will then be obtained next March, at which season they root more readily than at any other.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

ANTHURIUMS.—Specimen plants will be now in a state of rest, and care must be taken not to over-water them, as they require but little when they are not growing, but do not allow them to get dry at the roots at any time. The drainage should be in good order, and the plants placed in a good position in the house so as not to be crowded with other plants. *A. Andreanum* is the most continuous flowerer of the class, and it is excellent for brightening the stove or for decorative purposes during the winter. A good quantity of them should be kept in 5 or 6-inch pots for this purpose. During the summer they will grow well and keep a bright colour in quite a cool house. *A. Veitchii*, one of the most useful of the large foliage section, grows well in a cool conservatory during the summer, it is much hardier than *A. Warocqueanum*.

POINSETTIAS should now have a warm moist stove temperature, and a liberal supply of manure-water at the roots; but care will be required not to over-water, or yellow drooping foliage will soon be seen. A slight amount of shading is sometimes necessary, but avoid it as much as possible; during bright weather syringe and close the house early; but syringing overhead must be discontinued when the bracts are showing colour. A temperature of from 60° to 65° by night, and 65° to 75° by day, suits them well.

ARDISIA CRENULATA, *A. alba*, *Rivinia humilis*, pretty berry-bearing plants, are very useful during the winter months: they should be placed near the glass at the cool end of the stove. Give them manure-waterings, and keep clean from red-spider. *R. humilis* in small pots is very useful.

GREENHOUSE HARD-WOODED PLANTS will need careful attention to watering and ventilation during the declining days of the season. Avoid over-crowding as much as possible. If grown in mixed houses of plants, they should be placed on side-tables, or on inverted large pots in the best positions, as near to the glass as possible, and where they will get abundance of air. If mildew is seen upon them, dust with flowers-of-sulphur.

CHRYSANTHEMUMS will require constant attention, and all plants should now be safely under protection. Abundance of air must be given night and day. A temperature of from 40° to 50° by night, and 55° to 65° by day, is best for them; fire-heat should be avoided as much as possible, as it spoils the incurved varieties. Liberal waterings of cow-dung water, clear soot-water, or a pinch of some well known plant-food about twice a week, should be continued. Proceed with the training, but from a decorative point of view the less this is done the better. Hazel-stakes are best, they are easy to cut up for specimen plants, and are about the same colour as the *Chrysanthemum-wood*. For decorative plants

in 8 and 10-inch pots, one strong stake in the centre, and each shoot neatly looped with thin twisted pieces of raffia are best.

ROMAN HYACINTHS, NARCISSUS, TULIPS, ETC.—The early-potted batch placed under ashes should be examined, and brought into a cool-house or pit, if they are starting to grow; if left too long, they will spoil. Do not give them much air for a few days, and if the weather is very bright, afford a little shade for a day or two.

PELARGONIUMS.—The show, spotted, French, and general collection of these should be potted on as they require it; give them a light, airy place in a span-roofed pit, if possible on a wood trellis. Old plants that were cut down in August should now be growing well; do not give them much water till they are growing. Strong cuttings that are well-rooted should be potted off into 60's; affording them good loamy leaf soil, with a little rich manure, and plenty of sea-sand.

THE KITCHEN GARDEN

By H. C. PRINSEP, Gardener, Burted Park, Uckfield.

FRENCH BEANS.—In most districts these are still flourishing in the open ground, and those who made late sowings have gathered an abundance of this most useful vegetable. Up to the present time frosts have been slight, except in low damp situations. With shorter days and subsequent lowering of temperature, vegetation is not so rapid, and we must expect frost to soon put an end to all further outside growth. Those in frames must be protected with mats or other warm covering to exclude the cold, but air should be freely admitted on warm days if the sun is bright, to keep the plants sturdy. Make another sowing for succession, either in heated pits or in pots. If in the latter, they should be placed near the glass, to keep the plants dwarf. Those that are well up through the soil must have all available light and air. Thin out the plants where too crowded, as nothing is gained by growing closely.

SALADS.—These are now good and plentiful—Lettuce has made rapid progress since the rains, especially Sutton's Mammoth and Hick's Hardy White, two good autumn varieties. Brown Cos is also turning in well, and will prove useful later. Material should be at hand for protection, in case of an early severe frost. Continue to blanch Endive, taking care to do so when the foliage is quite dry. Planting of these and Lettuce may still be done in favourable situations, for in the event of a mild winter, they will be serviceable in spring. Dandelion and Chicory should be taken up for blanching as required, and where young Onions are in demand, sowings should be made in pans or on slight hotbeds, to keep up the supply. Radishes are now crisp and tender, especially those that were sown thinly on a south border, but as they are not now so much in request, further sowings are hardly necessary at the present time.

CAULIFLOWER.—This crop will now demand careful attention, for a slight frost will injure the tender heads, and render them useless. Those just turning in must have the leaves bent over them, and if there be any signs of a frosty night, a little bracken put on the top will prevent the frost from penetrating. Young plants should be transplanted into frames, or on to a sheltered position outside, where they can be protected.

BROCCOLI.—On cold, heavy land, it is well to lift these and lay them down with the hearts facing north. It is usually the stalk, just at the bottom of the leaves, which suffers most from frost, and if the plants are lifted now, and laid down in such a manner that this part of the stem is covered with soil, there will be little fear of their being killed. From experience we find it a thorough good plan to lift all except early kinds. These usually turn in before very severe weather comes.

ASPARAGUS BEDS.—The top-growth on the plants will now be ripe, and as it will be of no further benefit to the roots, may be cut down. Should there be any ripe seed, it may be gathered and put together for the pulp to decay, after which the seeds may be washed and put to dry. The seed will be found useful for sowing thickly in small pots where there is a lot of decoration to do; as when growth is small it is very effective. All weeds should be cleared off the beds; and where they were earthed up in spring for blanching, the soil should be raked down into the alleys. The beds may then have a dressing of well-decayed manure spread over them, about 4 inches thick.

EDITORIAL NOTICES.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY,	Oct. 24.	Royal Horticultural Society's Committee, at the Drill Hall, James Street, Westminster.
WEDNESDAY,	Oct. 25.	Floral Committee of the National Chrysanthemum Society, at the Royal Aquarium, Westminster.

SALES.

MONDAY,	Oct. 23.	Dutch Bulbs at Protheroe & Morris' Rooms.
		Plants at Protheroe & Morris' Rooms.
TUESDAY,	Oct. 24.	Clearance sale of Greenhouse Plants at Lyndhurst, Alleyo Road, Dulwich, by Protheroe & Morris.
		Absolute unreserved clearance sale of Nursery Stock at the Nurseries, Sunningdale, Berks, by order of Mr. C. Noble, by Protheroe & Morris. (Three days.)
WEDNESDAY,	Oct. 25.	Dutch and other Bulbs, at Stevens' Rooms.
		Dutch Bulbs at Protheroe & Morris' Rooms.
THURSDAY,	Oct. 26.	Absolute clearance Sale of the Orchids and other Plants, also Lease, at United States Nursery, Hextable, Kent, by order of Messrs. Pitcher & Manda, by Protheroe & Morris. (Four days.)
		Special Sale of Dutch Bulbs, at Stevens' Rooms.
FRIDAY,	Oct. 27.	Dutch Bulbs, at Protheroe & Morris' Rooms.
		Dutch Bulbs, at Stevens' Rooms.
SATURDAY,	Oct. 28.	Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—47° 7.

WERE it not for the sub-title, "Hints on good Taste in Gardening," we might have been reminded by the title of this book* of those plaster nymphs and arches of burrs and whelkshells which are still so common in our suburban gardens, and of those fearful and wonderful constructions of globes and obelisks of flowers and foliage common in American parks. These things belong to the infancy of garden decoration, and are sure to be discarded as knowledge increases. The architects of our time, who ought to know better, are wont, or some of them are, to refuse to consider the creations of the landscape gardener as works of art, but place them on a level

* *Art Out-of-Doors*, by Mrs. Schuyler van Rensselaer, (London, T. Fisher Unwin, 1893). Pp. 399.

with the ignorant vulgarities of which we have just spoken. Mrs. VAN RENSSELAER holds different opinions. To her gardening is "the art which stands nearest to Nature," and this expression forms the key-note to her book. Now, natural scenery, which is so full of suggestion to the landscape artist, is in all cases the result of adaptation to circumstances. The hills owe their outline to a compromise between the resisting powers of the rock or soil, and the disintegrating action of water, or ice, or air. The river-banks owe their curves and bends to the reciprocal action of the texture of the soil and the action of the water. The vegetation differs according to soil and aspect, and that aggregate of conditions which we call climate. When the balance is fairly adjusted, the general impression is one of harmony. Such harmony might, it is conceivable after a time, be monotonous; but this is obviated by the infinite variety of colour, and the exquisite gradations of light and shadow to which even the tamest of scenery is subjected. Moreover, the beauties of natural scenery are often intensified by sharp contrasts. It might seem at first as if these contrasts were antagonistic to the principle of harmonious adaptation to circumstances; but a moment's reflection will show that they are not so, but are simply the expression of a harder struggle to gain the same ends. Whether it be the Matterhorn rising in marked contrast from the pastures at its base, or whether it be a mound of London clay, scarcely differing, save in being a mound, from the surrounding green meadows—the principle of formation is the same. It is only a question of degree. The contrast does not imply an absolute difference of procedure, but only a variation in its intensity, owing to diversity, again of degree, in the material operated on. Harmony and contrast, then, so often considered as opposite and antagonistic properties, are but extreme conditions of one and the same faculty of the adaptation of things to circumstances. We can hardly conceive of any other relation in natural work, but in the work of man we are too often shocked by the irrelevance and utter want of relation between his productions, the place they are to occupy, and the office they are to fulfil. Of course, this arises from ignorance and want of observation, and it is the function of such a book as we have before us to dispel that ignorance, and to induce people to make intelligent use of their eyes. The most successful landscape gardener is not he who servilely copies what he sees in Nature, but he who has the sense to select what Nature offers, and to adapt it most fittingly to the desired purpose. This demands skill, and necessitates imagination and genius. To refuse the title of artist to a man who possesses these faculties is clearly absurd.

Mrs. VAN RENSSELAER, whose opinions on these subjects were originally published in *Garden and Forest*, is not the advocate of any one style exclusively. She is devoid of any extreme views, dogmatism, or "fads." On the contrary, much of what she says is marked by sound common sense, a rare faculty in art critics, and her views on the beauty of appropriateness sketched in her first chapter, and touched on in numerous other parts of her book, are in full harmony with the general principles of adaptation to circumstances as before alluded to.

In illustration, we may cite one passage relating to formal flower-beds, which the author tells us "are artistic whenever they look as though they belonged in the place where they lie; and this leads us to the fact that they are especially artistic when they look as though this place

belonged to them, as though it had been prepared for them, and could not rightly be filled with anything else." This, of course, is the principle upon which all ornament should be applied, whether it be intended for the decoration of a façade, or the adornment of a terrace-garden. "We shall be well served," says Mrs. VAN RENSSELAER in another place, "only by good sense taking account of particular local facts, and based upon principles which themselves are based upon the same great laws that direct intelligent effort in all the other arts. Simplicity, harmony, appropriateness, variety in unity, clear expressions of clearly conceived and fitting schemes. These are the results to be desired in our parks and country homes as in our pictures, our statues, and our city houses."

We have said enough to indicate the general trend of Mrs. VAN RENSSELAER'S book. It is written mainly for American readers, and for conditions which are always not the same as ours, but we may, in cordially recommending the book to the notice of our readers, give a fuller idea of its nature by indicating the titles of its chapters, as follows:—The Art of Gardening—Aims and Methods—The Home Grounds—Close to the House—Roads and Paths—Piazas—Formal Flower-beds—Formal Gardening—A Word for Architecture—Outdoor Monuments—Cemeteries—The Beauty of Trees—Four Trees—A Word for the Axe—The Love of Nature—A Word for Books, and the Artist. An appendix contains a list of the principal books on gardening art.

Violet Culture in London.

WE have received from a lady correspondent, residing in the neighbourhood of Regent's Park, a letter complaining of her inability to make Violets in frames bloom satisfactorily; in fact, her efforts have resulted in a total failure to obtain any flowers during the winter. This unfortunately happened, notwithstanding a close observation of the directions for cultivating Violets in frames given by ourselves. Provided there was no lack of the proper and essential matters of giving air, little or much in all weather, when there is no actual frost, that the frames are fully exposed to sunlight, and uncovered in the morning as soon as the sun shines on them, or before that point of time if it be mild weather, we can only account for her want of success by the well-known susceptibility of the Violet to the malign influences of London fog, and the consequent diminution of sunlight. It is the usual case with Violet plants out-of-doors in suburban gardens to dissolve, as it were, into nothingness under the usual conditions of the weather during December, January, and February. The plants do not then, as a rule, die out the first season, but make feeble efforts to grow, but so weakened are they that they succumb during the second winter. In a lesser degree this would probably be the case with plants in cold frames, and they would flower but little or not at all until the spring. Other plants suffer greatly from London fog, of which we may instance Pansies, but they are not so much enfeebled as the allied Violas, which may die down to the roots, but still bloom abundantly at the proper time; Picotees and Carnations, but not all varieties; plants of the Primula family; Saxifrages, with moss-like foliage; and such hardy subjects as Sage, Thyme, Southernwood, and Lavender. These ill-effects of fog and smoke have greatly increased with the extension of London, rendering the cultivation of many hardy herbaceous plants that were formerly grown very well within 2 miles of Charing Cross an impossibility.

ROYAL HORTICULTURAL SOCIETY.—The next meeting will be held on Tuesday, October 24, in the Drill Hall, James Street, Victoria Street, Westminster. The Council of the Society have offered special prizes for Apples and Pears grown in the open air, and also for Grapes. At 3 P.M. Mr. A. DEAN, F.R.H.S., will deliver a lecture on "The Cultivation of Onions," examples of which would be welcomed at the meeting.

NATIONAL CHRYSANTHEMUM SOCIETY.—We are requested by the Hon. Secretary to state that on the occasion of the great exhibition at the Royal

exhibition has been arranged as follows:—President, M. ALPHONSE DE COCK, administrateur de la Société royale d'horticulture of Antwerp; vice-presidents, the Comte DE KERCHOVE DE DENTERGHEM, membre de la chambre des Représentants, and president of the Royal Agricultural and Botanical Society of Ghent; M. JEAN EVERAERTS, vice-president of the Royal Horticultural Society of Antwerp; Secretaries, MM. ANATOLE DE COCK, assistant-secretary to the last-named Society; LOUIS LUBBERS, secretary to the federation of the Horticultural Societies of Belgium; and CHARLES VANDERLINDEN, secretary to the Royal Horticultural Society of Antwerp.

the bare rock, will prove valuable for cutting, as no other species of the same genus has such long flower-stems. A Diploma of Honour à l'unanimité was allotted to M. MOENS, for *Cypripedium Spicerianum* × *Lowi*, and most resembling the latter variety; a similar award was made to M. LINDEN, for a new *Cypripedium*, the petals of which were curled up along their entire length. A Certificate of Merit was awarded to the same exhibitor for *Catasetum Claesianum*, with yellow hermaphrodite (?) flowers. First-class Certificates of Merit were awarded à l'unanimité to M. LINDEN for *Cattleya maxima* Leopoldi, the flower unusually dark, the lip very peculiar, with

FIG. 86.—MR. O. F. WILSON'S JAPANESE IRIS GARDEN WISLEY. (SEE P. 499.)

Aquarium on November 7, 8, and 9, the flowers competing in class 27 of the amateurs' division will be considered when the special *Gardeners' Magazine* Medals are awarded. This class was unfortunately omitted from those mentioned on p. 64 of the schedule of prizes. Also that the awards in class 48, being special prizes given by Mr. E. C. Jukes, will be the Silver-gilt, Silver, and Bronze Medals of the Society. The Floral Committee will meet on the second day of the show, Wednesday, November 8, at 2 o'clock, and not on the first day of the show, as heretofore.

THE ANTWERP EXPOSITION UNIVERSELLE.—The management of the horticultural section of this

MEETING OF THE BRUSSELS ORCHIDÉENNE.—One of the best shows held by this Society during the five years that it has existed. Sixty-five Orchids were shown by thirteen growers. A First-class Diploma of Honour was awarded to M. CLAES, who both introduced and staged some *Cattleya Alexandræ*: one of the varieties had an unusually dark lip; another, broad, and almost greenish divisions. The plants were, indeed, just as they were described when discovered. One of the specimens bore a flower-stem with five blooms; in a year or two they will bloom as they do in their native country. The divisions of the flower are brown at first, afterwards shading into a violet tint, which makes them very distinctive. This *Cattleya*, which in Brazil grows on

a broad central band of golden yellow and a white ground veined and streaked with dull purple; to the same exhibitor for *Cattleya Eldorado* var. *Oweni*, with the divisions creamy-white, the base of the lip saffron-yellow bordered with white, and the extreme edge purple; and for *C. Warocqueana fascinata*, a large flower of wonderful colouring, the lip very dark, edged and marked with lilac. First-class Certificates of Merit were allotted to M. LINDEN for *Cattleya Warocqueana flammea*, with a large lip and dark colouring; and for *Cypripedium Rothschildianum*, Linden's var., a fine variety, with four good flowers all equally fresh; also for *Cattleya Eldorado Treveroniae*, flower pale, an unusually beautiful shade of tender rose, the lip orange-yellow; also for *C. E.*

Lindeni, flower lilac-rose, lip wide, at the base bright yellow bordered with dark purple; to M. LANSBERGER for Paphinia grandis, a large and fine flower; to M. LINDEN for Lælia grandis, a splendid flower, with a large lip of dull and very rich colour; to Dr. CAPART for Odontoglossum crispum, petals white, sepals white bordered with violet, each division marked with a great red spot—a fine variety; to M. LINDEN, for O. crispum, flower-stem with fourteen blooms, with pure white petals and sepals marked with red, flowers large, and well massed; to M. VAN IMSHOOT, for Cattleya aurea, a beautiful flower, with a very large lip, the ground colour very bright yellow, marked with broad stripes; and for C. aurea, a variety with a large and entirely-striped lip; also for C. gigas, a flower of unusual size, each petal measuring over 5 inches in width—a splendid thing; also for Miltonia Moreliana atropurpurea, remarkable for the darkness of its colouring. Second-class Certificates of Merit were awarded to M. VAN WAMBEKE for Cattleya Warocqueana majestica, remarkable for its fine colouring; and to M. LINDEN, for C. W. formosa, dark in colour—a fine flower, with a lip well-marked and bordered. *Ch. de Bosschère.*

SECOND CROPS.—There were shown at Brussels on October 7, some Pears gathered from a tree which bloomed for the second time in July, and also a branch of Apple bearing both fruit and a second crop of bloom.

EXETER GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—At Exeter Guildhall on Wednesday evening, 11th inst., Mr. D. C. POWELL, of Powderham Gardens, read an interesting and instructive paper on "Pears and their Culture." This paper was the first of a series of essays which will be discussed during the winter session. Mr. G. B. CARLILE presided over a large attendance. A long discussion followed, and the meeting terminated with a vote of thanks to the chairman and the essayist.

A LARGE PEAR.—A Pear has been gathered at Charly (France) measuring nearly 10 $\frac{3}{4}$ inches in circumference, and 5 $\frac{1}{2}$ inches in length without the stalk.

A NURSERYMAN'S CATALOGUE FROM AUSTRALIA.—There has recently come to hand a catalogue of seeds, plants, trees, and shrubs from Messrs. ANDERSON & Co., 216, 218, Pitt Street, Sydney, which, in regard to its numerous illustrations, may be classed with the best of those issued in this country. Amongst the vegetables offered are the best of our home kinds and varieties, with a few which are presumably native to the soil; and as befits a catalogue intended for residents in a climate warmer than ours, we find highly recommended for cultivation Soya Beans, Snake Beans, Table Maize, Butter Beans, Okra (*Hibiscus esculentus*), Rosella (*Hibiscus rosella* var.), Pumpkins, and Squashes. Amongst fruits are given Jack Fruit, Loquat, Mango, Rose Apple, Japanese Persimmons or Date Plum, Lemons, Oranges, Limes, Shaddock, Citrons, Himalayan Blackberries, Cape Gooseberry (*Physalis edulis*), Japanese Plums, Bananas, Water Musk or Rock Melons, Egg plants, and many kinds of Pepper (*Capsicum annuum*). The new Clover, *Lespedeza striata*, is a plant squatters and station-holders are recommended to sow, it being one that does well in any kind of soil, and withstands drought. Teosinte, a Maize-like plant from the Tropics, and growing from 10 to 12 feet in height, is stated to be a desirable forage plant for Queensland and other warm parts of Australia. Seeds of a good many species of Eucalyptus are offered, and the uses to which they can be put are indicated, and a brief description of the timber is given. The same is done with Casuarina and Acacia. The flower-list is good and extensive, but we should say that native flowers ought to preponderate, and not those found suitable in Britain. Such, however, is not the case, for we do not find one native flower mentioned. How odd it must be to find in an Australian garden the Cowslip, Convolvulus, Aubrietia, Armeria, Arabis, Antirrhinum, Daisies, Cornflowers,

Pansies, Marigold, Musk, Lunaria biennis, Myosotis, Polyanthus, and species of Primula. We can but wonder how such plants appear under the brilliant sky and unclouded sun of that southern continent. The catalogue is rich in Roses, in Camellias, and in our varieties of florists flowers. As showing how we English carry the old home over the world wherever we may chance to settle, this list is a capital indicator.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.—The annual report by the Directors, read at the meeting, stated that the floral gala, held in the Central Park, Aberdeen, on August 17, 18, and 19, proved to be the most successful yet held under the auspices of the Society in respect of entries and the quality of the exhibits. The entries numbered 1778, being the largest number since the formation of the Society. The financial result was not so satisfactory, although the Directors endeavoured to cater for the public by providing additional attractions.

DR. JOWETT.—In reference to the late Master of Balliol, it is recorded in the *Times* that in the previous generation another member of the family, Dr. JOWETT, was Master of Trinity Hall, Cambridge. He was a man of worth and ability, whose diminutive stature and certain idiosyncrasies of character led to the production by one of his undergraduates of the following lines:—

"A little garden little JOWETT made,
And fenced it with a little pallisade.
But little taste had little Dr. JOWETT,
And little did his little garden show it."

FLOWERS IN SEASON.—Recently we received from Messrs. BALCHIN & SONS, Hassoeks Nurseries, Sussex, a few spikes of Tuberoses which were remarkable for the number of blooms which they carried, and the strength of the spikes. On each stem there were from forty to fifty open flowers and buds.

NOMENCLATURE OF HORTICULTURAL FORMS.—The committee appointed by the Madison (U.S.A.) Botanical Congress recommended:—"1. That the nomenclature of the species and natural varieties used in forestry and decorative gardening should be treated by horticulturists precisely as they would be treated by botanists if found growing wild, and that they should therefore be subject to whatever rules by international agreement are adopted for general botanical nomenclature. Pending the adoption of such a code of rules, however, the names used in NICHOLSON'S *Dictionary of Gardening*, so far as they go, should be used. In cases where NICHOLSON is insufficient, the *Kew Index*, now in course of publication, should be followed so far as it goes. In case of the displacement of familiar names, these should be retained in parenthesis until both dealers and purchasers have become familiar with the change. 2. The nomenclature of florists' races and forms, as well as the more numerous artificial, and more or less transient forms of the fruit grower, vegetable gardener, and farmer, should be conducted on quite different lines from that of natural species and varieties, and all names used for such forms should be in the vernacular. Phrases should not be employed as names, and all such vernacular names should be limited to one, or at most two, words, avoiding high-sounding or bombastic names, as well as those which have already been relegated to the list of synonyms. Priority of naming these forms should be recognised. Varieties and forms transferred to a country possessing a different language from that in which they were first named may be re-named, in case the name cannot be transferred directly to the language, the new name conforming so far as possible to the form and sense of the original name, and citing it as a synonym. For use in trade catalogues the names adopted in the official lists of various national societies should be adopted." [It will be seen that these recommendations are in the main those which have been repeatedly advocated in these columns.]

JAMAICA.—Mr. WILLIAM FAWCETT, the Director of the Public Gardens, &c., in Jamaica, has published a provisional list of the indigenous and naturalised flowering plants of Jamaica. It is based on GRISEBACH'S *Flora of the British West Indian Islands*. The total number of species amounts to 2130, about 150 of which are Orchids. An index is also provided, so that this list will be very serviceable to all who are interested in the flowering plants of the island.

GILBERT WHITE.—The current number of the *Journal of Botany* contains a list of plants growing in the neighbourhood of Selborne. The list is taken from a copy of HUDSON'S *Flora Anglica* (1762), which has WHITE'S autograph on the fly-leaf, and a note, also in his handwriting, in which it is said that all the plants "found within the parish of Selborne, in the county of Southampton, are marked with a ×." The enumeration contains 439 species.

A. M. FERGUSON, C.M.G.—The *Tropical Agriculturist* for September has a portrait and a biographical notice of this gentleman, who was born in Wester Ross in 1816, and died at Colombo in 1892. Fifty-five years of his life were passed in Ceylon as a planter, and later as a magistrate and editor. His services in the development of the industries and general welfare of Ceylon were exceptionally great, and were appreciated far beyond the limits of the island.

MANCHESTER FIELD NATURALISTS' SOCIETY.—The report for the year 1892 contains the second report of the Air Analysis Committee, including details as to the amount of sulphurous acid and organic matter in the air, the atmosphere of towns in relation to animal and plant life, the occurrence of fogs, the intensity of light in Manchester and the suburbs, and cognate subjects.

TRINIDAD.—The March number of the *Bulletin of the Royal Botanic Garden, Trinidad*, contains a classified list of the plants cultivated in the garden. The distribution of plants from the garden now averages 30,000 per annum, and in some years this number is almost doubled. The list contains the scientific and vernacular names, the habit, and what is not so common in similar lists, the price at which plants may be purchased. The whole is compiled by the energetic curator, Mr. Hart.

LARGE PEARS.—Mr. R. LEWIS, of Cholsey, Berks, last week gathered five Pears, measuring on an average 15 inches in circumference, 6 $\frac{1}{2}$ inches in length, and weighing 1 $\frac{1}{2}$ lb. each. They were specimens of the variety Colosse Calebasse.

HORTICULTURAL COLLEGE, SWANLEY.—At the Experiments Committee of the Kent County Council, held at the Horticultural College, Swanley, on Thursday, October 5, Professor F. CHESHIRE, F.L.S., gave a lecture on the "Root Pruning of Fruit Trees," with special reference to Apple on the Paradise stock, and Pear on the Quince stock. At the next meeting, Thursday, October 19, a free public lecture is to be given on Fruit Culture, illustrated by photographic lantern slides.

"**NATURE LOVER.**"—We have received the first (October) number of the *Nature Lover* (ELLIOT STOCK), a magazine whose title sufficiently shows its scope and contents. It is addressed to the observant enjoyers of Nature rather than to her earnest students. There is a sprinkling of poetry through the pages, and the list of contents concludes with an "&c., &c.," which we suppose to allude to the answers to (early) correspondents. The whole paper reminds us of our old friend, *Nature Notes*. The bad taste with which the anonymous writer in the *Nature Lover* attacks the dead and gone IZAAK WALTON, whose fame is certain to outlive his detractor's abuse, is to be deprecated.

CHRYSANTHEMUMS IN SOUTHWARK PARK.—The show of Chrysanthemums at Southwark Park to the number of 2000 is now, and will be for four weeks longer, open to inspection of the public. The plants

have been arranged by Mr. BAILEY, the Superintendent, in a manner as artistic as is compatible with the circumstances.

THE POTATO HARVEST IN LINCOLNSHIRE.—The Potato harvest in the Fen district of Lincolnshire, as we learn from the *Leeds Mercury*, is now almost completed. Generally speaking, it has been one of the best experienced for several years, and those who risked planting a large acreage with the tuber have had no cause to regret having done so. The early varieties, especially, made some very high prices, and several growers made as much as £20 per acre, exclusive of the cost of digging the crop. The season has been an exceptionally favourable one, and owing to the absence of rain, very little disease has been noticed, and consequently less labour has been required for picking and sorting. Magnum Bonum, which is a variety much grown in the Fen district, has yielded heavily, and there are numerous instances—notably amongst allotment occupiers—where the crops have yielded at the rate of 7 and 8 tons to the acre.

HORTICULTURAL CLUB.—The session of 1893-1894 was opened on Tuesday, the 10th inst. The usual dinner and *conversazione* was accompanied by an interesting debate opened by Mr. GEO. BUNYARD, "On the Effects of the Drought as affecting Horticulture, more especially in its relation to Fruit." There was a good attendance, and much interest in the proceedings.

PUBLICATIONS RECEIVED.—*An Elementary Text-Book of Agricultural Botany*, with ninety-nine illustrations. Price 3s. 6d. (University Extension Series.) By M. C. POTTER, M.A., F.L.S. (METHUEN & Co., Bury Street, London, W.C.).—*The Shrubs of North-Eastern America*. By CHAS. S. NEWALL. Price 10s. 6d. (G. P. PUTNAM'S SONS, 24, Bedford Street, London, W.C.).—*Annual Administration Report of the Forest Department, Madras Presidency, for the Official Year 1891-1892*. (Madras: Government Press) Price 1 rupee 12 annas.—*Die Natürlichen Pflanzenfamilien*. By A. ENGLER. Ninetieth number. (Leipzig: WILHELM ENGELMANN'S Buchhandlung.)—*The Narrative of a Busy Life: An Autobiography*. By ARTHUR HILL HASSALL, M.D. (London: LONGMANS, GREEN & Co.)—*Romance of Low Life amongst Plants*, by M. C. COOKE. (Published by the Society for Promoting Christian Knowledge, Northumberland Avenue, London, W.C.) Price 4s.

A JAPANESE IRIS GARDEN.

We wrote of the beautiful gardens of Mr. G. F. Wilson at Wisley and Heatherbank in the *Gardeners' Chronicle* of August 12 of the present year, and made special reference to the flower that is depicted in the accompanying illustration (fig. 86, p. 497). This garden, which is at Wisley, is in its way unique; it is utterly informal, and the grouping of many lovely plants is a source of relief to the eye tired by a repetition of tuberous Begonias or Pelargoniums in rigid beds. Here, in this Surrey wild, the Japanese Iris *lavigata* (I. Kämpferi) is perfectly at home, and we venture to think that in no other spot in England is got together such a splendid collection, or grown in a more natural way. The time to see them in their full beauty is in the beginning of July, although a common impression is that August is the month for the Japanese Iris. Much depends, of course, on the character of the season; but, as a rule, the time named is the season for this annual revelation. The plants enjoy positions in the full sun, and are the earliest to arrive at their flowering stage, but a succession is maintained by planting in shady spots, prolonging the season for two months. I. Kämpferi,

as it is generally called, is a stranger to most gardens, and in many places it is impossible to grow it well through lack of moisture in the soil. But English gardens are not all of this character. They are often adorned with artificial canals, trickling brooks, lakes or ponds, at the side of which this great Japanese flower will luxuriate.

Mr. Wilson is an enthusiast, as all the flower-world knows, and raises his own seedlings. He has hundreds of thriving masses, and a veritable stream, a wide ditch, the sides of which are clothed with I. *lavigata*, which in the summer creates a splendid picture of graceful growth, with varied coloured flowers poised above it. Near the entrance to Oakwood, a large pond is planted also at the side with this Iris, and the plants thrive to perfection, standing with water actually at the roots during the winter months. It was formerly considered fatal to permit this, but plants in this position have, from Mr. Wilson's experience, suffered no injury. The field of seedlings is worth looking at when the plants are in bloom. In a part of the new field upwards of 4000 clumps were planted, and many precious things occur amongst them. In Mr. Alfred Parsons' *Pictures of Japan*, one gets glimpses of this flower, which is grown very largely in that land of quaint and picturesque beauty. A coloured photograph by the writer's side shows a stream with this Iris enriching its slopes with flowers, and it is from this country that the large importations are sent to England. With each batch comes roughly-coloured sketches of the several kinds done on Rice-paper to give the purchaser an idea of the colours of the flowers. In Pigott's *Gardens of Japan*, allusion is made to the I. *lavigata*, and at p. 40 a drawing is given. The author describes the flowers as of every shade, from purest white to pale crimson. In a note Mr. Wilson contributed to the horticultural journals some time last year, he says that when Mr. Pigott was looking at the flowers at Wisley, he told me of flowers he had seen in Japan larger than any I had known in this country. When I told him of the belief that up to the time of the Vienna Exhibition I. *lavigata* had been sacred to the Mikado's garden, and not allowed to be sent out of the country, but that the desire to make the most effective Japanese garden prevailed, and Irises were sent over, and sold at the close of the exhibition, and distributed over Europe, he had not heard of this, and said he had seen them in several parts of Japan.

Writing of the size of the flowers, some of the bigger kinds in this respect are not the most beautiful, and there is an unfortunate tendency to get them double or semi-double. The single varieties are far more inviting, the beautiful curves of the segments are not destroyed, and they stand up boldly in the garden, creating a much more striking effect.

The Iris in any form does not lend itself to doubling. We once saw a double variety of I. *sibirica*, and we hope for the last time. The flowers of I. *lavigata* are of remarkable colouring, exhibiting charming diversity of shade, from pure white, through many tones of purple, to crimson. The spotted, or mottled, types are not a success, and lose in effectiveness. To get richness, one colour, or at least shades of one colour, melting into the other in gentle gradations should be selected.

Why should not all good gardeners take a lesson from Wisley, and plant the Iris *lavigata* naturally, as one sees it in its native home? The impression that once gained ground, that the plant was difficult to grow, is, we hope, removed, as it is as easy to manage in this respect as any other Iris, if given moisture, which is essential. Dryness is fatal, and the miserable plants one sometimes sees are simply due to a want of this necessary to existence.

All good nurserymen now supply plants at a reasonable price, and the enjoyment of growing the lovely flower is increased by raising seedlings, as does Mr. Wilson. There is the anticipation of something new, or one gratifies oneself, and gives to the world a novelty. Many hardy plants are grown at Wisley, but I. *lavigata* shares with the Lily

the first place. *Visitor*. [The photograph, which is reproduced in our illustration, was taken by Lady Pigott. Ed.]

HOME CORRESPONDENCE.

HOW RED SPIDER WAS GOT RID OF.—Readers of the *Gardeners' Chronicle* for August 20, 1892, p. 210, may probably remember my having strongly recommended the use of bricks for the covering of the surface of Vine-borders, both inside and out. The bricks should be merely laid on, without being either pointed in cement or mortar. I am still as great an advocate for the brick "dodge" as ever, not only because their protective presence brings the roots to the surface, where they can be readily and effectively fed with manurial stimulants, resulting in better Grapes, and of a rich blue-black colour, which the brush of no artist could equal. What I most desire to set forth here is, that by their use I have completely got rid of that—to gardeners—most troublesome pest, red-spider. The summer now passed away being so unusually hot and dry, I have heard gardeners complain what a dreadful season it was for red-spider. I am now, however, in a position, and pleased to be able to say, that the brick mulching as adopted here has brought about total immunity from this persistent, busy little tyrant of our houses, and specially so of our vineries and peacheries. In proof of my assertion, I send herewith a couple of leaves from our early Peach-house. From the time of starting the respective houses down to, and long after the time of, gathering the fruit, these bricks are kept always moist—wet, I might rather say. No dry dusty borders are ever allowed. Whether these insects lay their eggs in, and reproduce themselves amongst, the dry dust of the borders, I am not prepared to say; but having guessed as much, and having tried the antidote of perpetual wet bricks, I am now in a position to say that I have got rid of this disagreeable little lodger, who has, to our great grief, hurt, and annoyance, so long associated himself with almost every move of our indoor horticultural practice. The above refers only to what we call here our "long range" of vineries and Peach-houses. We have, besides, other two long lengths of Peach-cases, to which the brick cure has not yet been applied, in which I am bound to admit we have still a slight sprinkling of spider, notwithstanding all our efforts of constant and copious syringing. There is an old maxim, namely, that "Cleanliness is next to godliness." We should hoe where there are no weeds, smoke where there are no green-fly, syringe where there are no red-spider, and do all else imaginable where there is not even the ghost of a mealy-bug. Young gardeners might do well for themselves by committing these rules to memory, and observing them in their daily practice. Modern technical education teaches many useful things, but these, too, ought to find a place in its curriculum. *W. Miller, Combe Abbey.*

THE NAMES OF THE VINES AT CHISWICK.—There are some names given by "A. D." in his note in a previous issue of the *Gardeners' Chronicle* which do not seem to be right; for instance, Moore's Seedling is more generally known as Moore's Early, and White Royal Muscadine is simply Royal Muscadine. Traharis puzzled me a good deal, and must be a misprint for Tenturier. *B. C.*

EMPEROR ALEXANDER APPLE.—It surely must have been through a slip of the pen that "W.," at p. 426, referred to this well-known Apple as "comparatively new." Some fifty-five years ago, when a school-boy, I, with my brother, "R. D.," had several times a day to pass a large tree of this Apple on our way through the Hill Nursery, Southampton, to and from school; and I have a vivid recollection of forcing one of the fine fruits that had fallen from the tree into one of my pockets, and of being unable afterwards to extract it whole, and of having to cut it out in pieces with a knife. It is, of course, of Russian origin, and, excepting perhaps Duchess of Oldenburgh, the best we have had from that northern country. Alma is a handsome and beautifully-marked Apple; it was, I think, then the finest fruiter of a large—or what was then esteemed a large—collection in the nursery, with perhaps the exception of the Cat's-head Codlin. There is hardly a fine variety of to-day amongst kitchen sorts that has not come into commerce since that day, or at least, if they were existing, they were not much known. Blenheim Pippin and Alfriston, two perhaps

of the older of modern show Apples, were certainly not much in cultivation. In the Hill Nursery all the trees were marked by bricks inserted under them on end in the ground, the end projecting being painted white, and numbered in black—an excellent method. I used to see my father's list of these Apples, and can now repeat accurately, as they ran up to twenty-five at least, and they were committed to memory more than half a century since. *A. D.*

THE PEAR CROP.—Although we experienced a summer of exceptional dryness and heat, the later varieties of Pears carried fruit of more than average size, and some, notably Pitmaston Duchess, appear to have exceeded all others. Here the variety was much larger than usual, my heaviest fruit scaling 2 lb. 1 oz., and the crop numbered forty, the total weight being 55 lb. 3½ oz. Ilacou's Incomparable, Glou Morceau, Beurré Rance, and Catillac have also grown to a much larger size than usual. The earlier varieties were small, and are keeping very badly, as also are most of the Apples, so many of them having been injured by wasps and birds. *J. H., Benham.*

CENOTHERA MACROCARPA.—This plant was very telling in effect in the border during the past dry season, having been in flower from May until the present time, although the majority of the border flowers have had a much shorter season of flowering than usual. It is a plant that does not like being disturbed, but should be allowed to establish itself in good clumps at a short distance from the front of a border. *J. H.*

POOR FOLK AND THE DISTRIBUTION OF BULBS.—Among the multitudinous charitable ideas of the present day, that have expressed themselves in societies, it seems strange that the idea of distributing bulbs among the poor of our large towns has never occurred. There is scarce a purer enjoyment, especially to children, than that of flowers, and the interest with which they would watch the sprouting and blooming of a Crocus, a Snowdrop, a Jonquil, or perhaps a Hyacinth, which would only require one bulb to satisfy, and how little it would cost! If a few ladies with spare time would start it, they would be amply repaid with the good they would do, and doubtless many of our bulb merchants would contribute donations of bulbs out of their abundance. The objection to many charitable societies is, that they make the poor less self-reliant, but that cannot be urged against this. *B. Piffard.*

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—As a member of the committee of the above society, I should like to be allowed to express my gratitude to those gentlemen who spoke in such an admirable manner at the annual dinner last week, a report of which appeared in the last issue of the *Gardeners' Chronicle*. The chairman, Mr. P. C. M. Veitch, in proposing the toast of the evening, made an excellent speech, clearly demonstrating the advantages to be derived by gardeners joining our Society. In speaking of the rules, he said he would like to see a graduated scale of payment, so that a member joining at an early age would not have to pay so large a contribution as an older one. But there is no necessity for such an alteration, because under the existing rules, a young man may join at the age of eighteen years, and should he live to reach the age of seventy, he could then draw his deposit with the accumulated interest, which would amount to considerably more than double the amount due to a member who does not join before reaching the age of 36 or 40 years. One thing should not be lost sight of, that is, after a member has subscribed for some years, the interest added to his deposit amounts to more than his annual contributions. Mr. Sherwood, who has done such noble work in starting and adding capital to the Convalescent fund, made a capital suggestion when he said that gardeners should endeavour to get their employers to subscribe to this particular fund, one reason why they should support it being, that if a gardener unfortunately have a serious illness, when recovering, a change of air might benefit him to such an extent, that he would be able to resume his duties weeks sooner than he could have done without the change. The work of the officers and the soundness of the Society, was highly spoken of by gentlemen competent to judge on these important matters. Mr. Marshall being one of the founders, knows something of the management, and he made an earnest appeal for donations to the Management fund. The committee do not feel justified in recommending a further tax upon members beyond the payment of

their annual subscription of 2s. 6d. to the fund; but if, instead of 500 members, we numbered 5000, the annual income to the management fund derived from the 2s. 6d. payments would amount to £625, then the committee would be in a position to provide their excellent Secretary with paid assistance, and adopt other methods of making the Society known throughout the country. The work at present is performed in a too economical manner, but the committee have no power to spend a penny more than is received for the management. As the Society is established for mutual benefit, I think it deserves the consideration of every Gardeners' Mutual Improvement Society. Would secretaries of these but apply to Mr. Collins for the rules and the last report and balance-sheet, the subject would form a most appropriate one for discussion amongst the members. When gardeners join in large numbers, and contribute voluntarily the sum of 1s. per annum to the Convalescent fund, there will be no cause to plead for outside help either for that or the Management fund. We have at the present time, in round figures, 500 members, and a capital of £8000 invested, or an average of £16 each member. *G. W. Cummins, The Grange Gardens, Wallington.*

MANURE FOR FRUIT TREES.—Perhaps it may not be generally known that Sea-weed is good manure for Pear and Apple trees. I have used it for some years with success; and I was acquainted with a gardener who applied Sea-weed every year to his Grape Vines, which bore heavy crops of Grapes. The weed has the best effect when it is laid on the soil at this season, what is left in the spring being dug in. *J. Maers, Marazion.*

STRAWBERRIES.—It may interest the readers of the *Gardeners' Chronicle* to know that I have for the last three weeks been gathering Strawberries perfectly ripe, and on looking through my beds to-day, October 10, I counted fifty berries on one plant, and should the weather continue fine and warm, I shall gather many more dishes. The variety is Vicomtesse Hélicat de Thury, of which I grow about 500 plants. I may add, these were not transferred from pots in the spring. *F. Roberts, Prestwood Hall, Stourbridge, Worcestershire.*

UNSEASONABLE FLOWERING.—The Narcissus (see p. 468) by no means stands alone. *Cooperia pedunculata* is making the same miscalculation; and as for Gentians, my garden looks like April so far as they are concerned. Irises, Anemones, &c., are all under the same delusion, as you will see from the contents of my little box. *H. E., Ryde.*

POTATOS IN 1893.—Will some readers of the *Gardeners' Chronicle* who are growers of Potatoes, kindly say if the past summer has been favourable or unfavourable to the growth and quality of Potatoes? We have about one acre of field Potatoes which are little less than useless. The varieties are the Bruce, Schoolmaster, and Magnum Bonum, and the last is the worst. The soil is a sandy loam, that was heavily manured for a previous crop—Turnips, which were consumed by sheep on the ground, but no other manure was afforded. The tubers were planted at the usual time, and no rain came from the time of planting till about the middle of August, and by which time they were nearly ripe, and the tubers about half the proper size; after the rain, they started to grow again, and the result is, one end of the tuber is very hard and quite ripe, while the other end is still in a growing state. It should be understood that there is but one crop of Potatoes, but a second growth of the tubers. I should be glad to know if anyone else has got any of the same, or if it could have been avoided this dry summer. I may add, that we had some in another field that was well manured, and these were just the same. We are about 150 feet above sea-level, and the ground is naturally very dry. *Constant Reader.* [The above letter illustrates a common occurrence in dry seasons; it may, perhaps, be avoided on land which can be irrigated—not otherwise. *En.*]

NAMES—NAMES.—With reference to your remarks at foot of Kew Notes, published in your issue of September 23, we would say that we always do consult competent authorities before giving names to new plants; but nurserymen like ourselves, who possess a certain [amount of] botanical knowledge, have to meet with many difficulties, especially in this country, where we do not often obtain the necessary support. After all, we must sell our goods, and we name them as we think fit, using as short and as characteristic names as possible. How would

it sound if we had named the plant "*Colcasia antiquorum* var. *Duffii*?" From a botanical point of view, this would perhaps have been correct, but certainly not practical from that of nurserymen. Moreover, we could not afford to wait perhaps many years before such a rather difficult plant produced flowers. *Dammann & Co., Naples.* [The proper course in such a case as our correspondents allude to, is to adopt a vernacular name, and not to give a Latin one, which may be misleading. We admit the right of our correspondents to name plants "as they think fit," but always providing they do not contravene botanical usage, or use a name likely to give rise to misapprehension. *En.*]

THE ONION TRIAL AT CHISWICK.—It is hardly open to Mr. Barron, having regard to his official position at Chiswick, one needing much tact as well as complete impartiality, to enter into a discussion such as "*Pioneer*" invites. That objection, however, does not apply to any member of the Fruit Committee, and especially one who, like myself, was present at the meeting held at Chiswick for the consideration of the Onion trial of the past season, which admirably concluded there. The members present were all persons having as much knowledge of the merits of Onions as does "*Pioneer*," and under no circumstance did they hold a brief for any seedmen. They found the trial as it was a very good one indeed for that season, and without any reference to the age or newness of sorts, or to the firms sending the stocks, made their awards absolutely and only upon the merits of the stocks as presented whilst yet in a growing state. I am absolutely certain that no impartial body of persons could have come to any other conclusions. We had as a committee no command to exploit Deverill's or any one else's Onions; and if there had been such, we should have treated it with contempt. "*Pioneer*'s" knowledge of certain Onions might previously have been such as to have rendered him a useful member of the Fruit Committee; but now, whatsoever his knowledge, his gross partiality has been shown in so obvious a degree, that he is quite out of court, and his opinion is not worth a rap. If trials are to be conducted at Chiswick, it is obvious that the fullest consideration must be given to the results they exhibit. In every case the sorts selected for awards were the best stocks, most even, fine, and true. Mr. Barron deserves all credit for the excellent form in which the entire bed of some fifty rows was presented to the committee. To write about certain new Onions being best suited to our English climate is nonsense, for we have had plenty of sorts that did admirably here long before the name of Deverill was heard of. If out of the seven sorts selected for awards so few are fit for our English climate, how came it that Mr. Deverill put into commerce the two Southport varieties and Coccoanut? Is it not a little too absurd to evoke the name of Deverill and also denounce it. This is indeed trifling. "*Pioneer*" may be interested to learn that not only were Improved Wroxton and Cranston's Excelsior included in the trial, but also such vaunted varieties as Ailsa Craig, Lord Keeper, Anglo-Spanish, and Royal Jubilee, but these under the ordinary culture of the trial were not so good as were those selected for the awards. With the prevailing prices of seed the committee have nothing at all to do. Were that point considered, awards could never be made to novelties. With respect to the Italian Tripoli Onion selected for an award, the seed came from the comparatively unknown firm of Vilmorin & Co., Paris, and not from the house of Deverill. Still, I hope some good may even come from Paris. As to selections from Excelsior, or any other variety, others have laboured longer in that field than even the late Mr. Deverill. *A. D.*

ODONTOGLOSSUM AND PHALANOPSIS.—The advice of Mr. Holmes, in his *Calendarial* notes in your last issue, as to the winter treatment of *Odontoglossum* and *Phalanopsis*, is somewhat new to me. I should like to ask him, through the columns of your paper, if he has found such treatment successful? *G. S.*

NERINE FOTHERGILLII.—I saw a fine batch of this plant in full flower at the Mote Park, near Maidstone, last month. The plants were standing on a shelf in a cool-house, where they got plenty of air. For all kinds of decorative purposes it would be hard to find anything more pleasing than this plant when in flower, and the flowers have the merit of being a most conspicuous colour, and an airy and beautiful form when closely inspected. *W. H. Divers, Ketton Hall Gardens, Stamford.*

A LARGE HOLLY TREE.—May I venture through your column to describe a Holly tree within 10 paces of my house, which is 1040 feet above the sea, which I venture to think is the largest in Great Britain. I have to my possession a report which was made on it in January, 1836, and at that time the tree "measured in circumference above the roots thereof 27 feet 6 inches, and estimated to be 60 feet in height, and is very branching, and the general opinion is that it is four hundred years old." The circumference of the tree now is 30 feet, and its height 43 feet, and it has sixteen main branches, measuring in circumference 11 feet 7 inches, 8 feet 2 inches, &c. It covers a circle the diameter of

were made is so peculiar, that no one really understands it (excepting possibly the chief of the department of awards). However, the awards have been dealt out with a very liberal hand, scarcely anyone appears to be omitted, though I doubt whether the exhibitors of really meritorious displays will feel the honour of an award so great when they notice that similar distinction has also been given to exhibits of decided mediocrity.

Among the English exhibitors named in the first list of awards are the following firms:—Jno. Laing & Sons, James Carter & Co., Kelway & Son, H.

the judges, some of the appointments made caused very unfavourable comment, as, for example, that of a lady unknown to horticultural fame, as a judge of florists' requisites!

Among American exhibitors, the State of New York claims the largest number of awards, the greatest display having come from that place. F. R. Pierson & Co., Peter Henderson & Co., Siebrecht & Wadley, Ellwanger & Barry, and Wm. Tricker, of New York; H. A. Dreer, A. Blanc, B. A. Elliott, and Dingel & Coard, of Pennsylvania; J. C. Vaughan, of Chicago; Pitcher & Manda, and E. D.

FIG. 87.—IRIS LEVIGATA (KEMPFERI) VAR. E. G. HENDERSON: FLOWERS NATURAL SIZE; LARGE, DEEP PURPLE, BARBED WITH YELLOW. (SEE P. 499.)

which is 54 feet, and its branches have numerous initials and dates cut on them, those which can be still deciphered ranging from 1700 to 1861. The most legible is that of J. Broughton, August 22, 1756, which is almost as clear as the day on which it was cut. Many of the branches are half eaten through with rot, and I have had all the sixteen supported by iron rods. The tree still shows great vitality, each year bringing forth numerous young shoots. It is rather curious that on the opposite side of the valley is another large Holly tree, which measures 17 feet 6 inches in circumference. *Geo. H. Lloyd-Vernoy, Col., Clochfaen, Llanidloes, N. Wales.*

Cannell & Sons, Anthony Waterer & Sons, Alexander Dickson & Sons. This list makes no mention of John Waterer, whose Rhododendrons were so much admired in June last; but it is likely that the list, though official, is by no means perfect, as I know of some omissions in the list of American exhibitors.

Among Continental exhibitors receiving awards, we find Hillebrand & Bredemeier; Vilmorin, Andrieux & Co.; Croux & Sons; V. Lemoine & Sons; M. Moser; and a long list of German seedsmen, nurserymen, and florists, including Henry Mette, Ernst Benary, Haage & Schmidt, Oskar Tiefenthal, Wm. Pützer, F. Roemer, Joseph Mock, and others. It must be stated that these awards are not competitive in the ordinary sense, since all who get them are on a parity; there are no distinctions of merit. Though there were some men of worth and standing among

Sturtevant, of New Jersey; R. & J. Farquhar, of Massachusetts; and E. G. Hill, of Indiana, are among the American firms receiving awards. But I think the real distinction of any display at the World's Fair will be the verdict of competent critics, rather than the official award.

In the latter part of September rain came, after eighty-three days of dry weather; this has been followed by violent storms and sharp frosts, which have wrecked the outdoor plants. The Dahlias from various foreign houses, including a good bed planted by Messrs. H. Cannell & Son, suffered so badly from the drought, that they did not bloom at all, and much of the herbaceous planting presented a miserable appearance. Among the exceptions, however, were the native Asters and *Boltonia latifolia*, which bloomed freely, in spite of dry weather. A fine show is made at the present time by a

THE WORLD'S FAIR, CHICAGO.

The first announcement of awards in the horticultural department was made in the latter part of September. The system by which these awards

collection of new Brazilian Caladiums; they are remarkable in colour, including a number of varieties, so waxy and translucent that one may read ordinary writing through the leaf. Among the odd colours may be mentioned Azulao, with centre and veins of mulberry-purple, with a grape-like bloom. Another very beautiful variety is Rio de Janeiro, a waxy leaf, bright flesh colour, with rosy veins. Guacuhy is another rose-coloured leaf, with red veins and deep purple stalks. These Caladiums are said to be entirely new to cultivation.

The beautiful Dicksonias, Todeas, Alsophilas, and Aspleniums exhibited by New South Wales will remain in America, the greater part of the collection going to the new Shenley Park conservatories at Pittsburg. The collection of Caladiums loaned by Mr. Geo. W. Childs, of Philadelphia, has been presented to the city of Chicago, a destiny which will be shared by many of the other plant exhibits.

The *Canna* exhibit is, of course, over now. The plants suffered at times from their exposed situation, but they made a brave show, though the German varieties were rather a disappointment. The general verdict is that Mme. Crozy is still the best for general excellence; add to this J. D. Cabos, Captain P. de Suzzoni, Florence Vaughan, Alphonse Bouvier, and Comte Horace de Choiseul, and we have six robust, free-blooming Cannas, which compose the cream of the lists, according to our experience in Chicago.

The *Nymphaeas* did but poorly, the Egyptian Lotus was a failure, and the *Victoria Regia* did not bloom at all. With these tender Lilies, no doubt the failure was due to the coldness of the water in the early part of the season.

In the Chicago parks, where all the tender Water Lilies are bloomed in the open air, a steam-pipe passes through the pond, and heat is turned on whenever the weather warrants it. Under these circumstances the *Victoria* has bloomed very successfully. However, in spite of cold water, *Nymphaea Laydekeri rosea* bloomed freely at the Fair, making a very favourable impression.

At the present time, the Chicago Horticultural Society is endeavouring to induce the Directors of the World's Fair to co-operate with them for the purpose of holding a grand Chrysanthemum show at the Fair during the first week in November, after the closing of the main exhibition. If the Directors think such a show will prove a financial success, there is no doubt of their aid. *E. L. Taplin, Chicago.*

THE BIRMINGHAM BOTANICAL GARDENS.

THE large glass annex connecting the large Palm-house with the Orchid and other houses, is now fully occupied with the Chrysanthemums, a very fine lot of medium-sized specimens in admirable health, but scarcely any yet open.

In the Orchid-house, a large plant of *Aristolochia gigas* Sturtevantii is in bloom, and has been blooming very freely for a long time. It is a spring-struck plant, growing in a monster pot, and has covered a large space at the end of the house, and on the roof. Several Orchids are in flower, amongst them *Dendrobium Phalaeopsis*, and *D. Schillerianum*; the pretty *Scuticaria Steelii*, with its *Odonoglossum*-like flowers, lemon yellow with cinnamon spots, growing in a small pan, and suspended; *Cypripedium concolor*, and several others; a fine specimen of *Oncidium pulvinatum*, *Dendrobium formosum giganteum*, very fragrant; the curious little *Phalaenopsis Esmeralda*, *Coleogyne (Pleione) praeox Wallichianum*, and some *Cattleyas* and *Laelias*.

In the new glass corridor from the entrance-gate to the Lily-house, with a row of Madame Desgranges Chrysanthemums on either side, a mass of a brilliant scarlet climbing *Tropaeolum*, of which Mr. Latham never had the name, is a superb object just now up the side and over the roof, showing how valuable these climbing varieties are for autumn and winter decoration when struck in the spring.

In the large circular pond in the centre of the

Lily-house, *Nymphaeas alba* and *rosea* especially are very charming just now, and in this house *Solanum Wendlandii* has been a striking and beautiful object for a long time, with its huge bunches of lovely mauve-coloured flowers hanging from the roof. This plant should be in every warm stove as a climber. Year after year that much-neglected plant, *Callicarpa purpurea*, is to be seen here in a high state of cultivation. Old plants are cut back hard in the winter to about 3 feet in height, and young growth made, and examples are now to be seen here of grand specimens, with shoots from 3 to 4 feet long, some longer, clothed with handsome clusters of berries of a rich colour resembling well-coloured Grapes. Grown in this way, they are very ornamental indeed.

The Edgbaston Gardens are always worth seeing, as things are done well there, and cleanliness and good culture strike one.

Mr. Latham has a great fondness for rare herbaceous and alpine plants, and many choice things can always be met with here in flower. On a narrow border running the length of the glass structures, many very interesting plants are to be met with; and here, against a low wall, the very pretty and quite distinct *Cotoneaster horizontalis* is a pretty object in its style of growth, and flower and berries. It is a beautiful plant for covering low walls, and should be in general use. On this border is a fine mass of *Opuntia vulgaris* and other Cacti, which has stood unprotected for several winters, and are in excellent health. Amongst other herbaceous plants in flower just now on this border are the pretty *Erigeron mucronatus*, a procumbent plant with its daisy-like flowers; *Caryopteris mastacanthus*, *Ophiopogon spicatum*, *Campanula isophylla alba*, a prostrate-growing variety, with an abundance of snow-white flowers, and an excellent basket-plant; the curious and pretty *Veronica cressoides* (this was not in bloom), a very ornamental plant for edgings of beds or carpet bedding, resembling a small Heath in growth; a mass of *Linaria pallida*, with its bright pretty blossoms; *Aster discolor*, one of the prettiest; and the curious *Amicia zygomeris*, a sub-shrubby Mexican plant, with yellow leaf-shaped flowers, and with strongly developed bracts, and of an ornamental character. *W. D.*

AMERICAN PARKS AND GARDENS.

(Continued from p. 429.)

Notable Nurseries.—"I presume you [Mr. G. Nicholson] visited some of our large commercial establishments in different parts of the country?"

Ellwanger & Barry.—"You may be sure I did, and found them very instructive. The famous nurseries of Ellwanger & Barry, of Rochester, for instance, which cover about 600 acres in all, have about 400 of them in fruit trees. I had no idea that the cultivation of fruit trees had attained such enormous proportions in any one establishment. I saw here, too, great numbers of ornamental trees, some of them larger than I had seen elsewhere. The large office building is situated in the midst of a beautiful lawn surrounded by trees, and perfect neatness and order prevailed everywhere. These nurserymen cultivate on their own grounds every new variety of fruit they can secure, to test them, but only propagate and sell those varieties whose value they have proved. It is the same with Grape Vines, of which there are 20 acres of different sorts in cultivation, and they fruit every one and test its worth before they offer it for sale. I saw 15 acres of Roses in all, in perfect health. As an illustration of the care these people take in cultivating stock, I will say that they do not grow the trees twice on the same land in succession. After they have removed one lot they hire another farm, so that fresh ground can be secured, and by this means they always have healthy stock, so that it is a genuine treat to see the products of their care. A handsome pavilion was shown to me, dedicated to the children of Rochester, and built at the expense of this firm,

whose public spirit is also shown by the fact that they gave twenty acres of land to be used by the people as a park. Another notable nursery is the one in Waukegan, Ill., where the veteran Robert Douglas, the pioneer in raising forest-tree seedlings in America, still grows Conifers in enormous numbers, especially such Western mountain trees as the blue Spruce, the Colorado Douglas Fir and the new Spruce named after Professor Brewer, of Yale, with long pendulous branches like a Weeping Willow. *New York Daily Tribune, Sept. 10, 1893.*

(To be continued.)

MUNCASTER CASTLE.

A SHELTERED dell, about 1 mile in length, runs from the sea-shore at Ravensglass up the side of a hill to the Norman Castle of Muncaster, which has been the residence of the Pennington family since the year 1244. On the way, the ruins of a Roman fortress are seen. Thirteen centuries have failed to destroy it, but those who have not the slightest respect for antiquity have laid sacrilegious hands upon it, using it as a common quarry. In the dell a large number of all kinds of Rhododendrons and Azaleas are to be seen, the vigour of the plants and rich colours of the leaves showing the suitability of the climate and soil for such plants. A very heavy rainfall, combined with fairly mild climate, due to the proximity of the sea, favour the growth of evergreens. Here are to be seen fine specimens of Rhododendrons *Jacksonii*, *R. praeox*, and *R. hirsutum*, and many of the beautiful hybrids; interspersed are examples of other plants suitable for a maritime climate, such as *Holliea*, *Escallonia*, *Sweet Bay*, *Skimmias*, &c., and groups of *Heleiums*, *Solidagos*, and other strong-growing herbaceous plants, give a bit of bright colouring. Behind these, but sheltered by large Beeches, Sycamores, and Austrian Pines, are many choice Conifers, which have been planted from eight to twelve years. These include beautiful glaucous *Picea pungens*, *P. nobilis*, and *P. Nordmanniana*, with *Abies Douglasi* shooting up vigorously above all. The soil is peaty in places, with rich hazel loam, and here and there granite and hematite crops up to the surface.

Upon reaching the top of the hill, the Castle suddenly appears among the tall trees. It has been mostly rebuilt in modern times, only one tower being of ancient date; it is built of granite obtained from local quarries, and was at one time surrounded by a deep moat, but this is now dry, and is full of trees. A grassy terrace runs for over half a mile on the east side of the castle hill, and along it a border has been planted with hardy perennials, which look very much at home there. The view from this terrace is grand; over the tops of the trees which grow on the grassy slopes the lovely Eskdale is seen, through which the Esk and its tributaries wind their tortuous paths. The mountains from which these streams rise form a many-coloured background—Corney Fell, with its granite quarries; the rugged Harter Fell, and in the blue distance the picturesque peaks of Scawfell.

The Castle walls are covered with a varied collection of climbers. The turrets look very rich with drapery of *Ampelopsis*, with its autumn tints; near the doorway the large leaves of *Aristolochia Siphon* are conspicuous, and many of the windows are curtained with cluster Roses. A large well-kept flower garden, with usual geometrical beds, lies in front of the chief rooms on the south side. The hall and drawing-room are covered with fine woodwork, with which the numerous plants and flowers used for decoration, associate well. Two green-houses are devoted to the growth of *Allamanda*, *Jasminum*, *Lapageria*, *Bougainvillea*, and other climbers, large sprays of which are devoted to the decoration of the rooms.

There are two extensive kitchen gardens, with vineries and Peach-houses, and an excellent fernery. A large crop of fruit is obtained from the trained trees, the best Apples being Warner's King, Worcester Pearmain, Cellini, and Alexandra. Lord Suffield

cankers, and Blunheims do not succeed, the best Pears being Jargonelle, Williams' Bon Chr sien, Marie Louise, and Easter Beurr .

On the east side of the hill an orchard has been planted, but probably owing to the poverty and shallowness of the soil—glacial gravel being here present to great depth—the trees have not grown well, and are now under experimental treatment.

Deer, pheasants, partridges, and other game, abound in the park and on the fells, the place being a favourite shooting resort; and on the low hills by the seashore there is a large gallery where the gulls are protected and allowed to breed. *F. V. D.*

COLONIAL NOTES.

A FLOWER SHOW IN MALAY.

The first Perak agri-horticultural show was held in the Barrack Square, at Taiping, on June 24 last, and it appears that it caused more than a flutter of excitement in that far distant British protectorate. Well, indeed, might it do so, for not only all the chief officials of state took the keenest interest in the affair, but even His Highness the Sultan undertook the part of a judge in the class of economic products. Moreover, the weather was of the finest, and natives attended in their thousands. The idea of a show had been discussed for the past two years, and the Government accordingly made a grant of twelve hundred dollars towards the expenses. Prize lists were published in the English, Malay, Tamil, and Chinese languages, and the show was divided into the following nine sections: 1, Flowering plants; 2, foliage plants; 3, cut flowers; 4, padi and rice; 5, vegetables; 6, fruit; 7, economic products; 8, miscellaneous; 9, live stock: subdivided into—(i.) elephants; (ii.) horses; (iii.) dogs; (iv.) cattle; (v.) poultry; (vi.) miscellaneous. Each of these sections was put under the charge of one or more members of the committee.

Some four days before the show was opened, the exhibits began to pour in, and they were all arranged in place by the evening preceding the show day. The day was fine, but very hot. Judging began at eight o'clock in the morning, and everything was ready for the reception of the public at ten o'clock. From that time to noon the sheds were literally thronged by thousands of natives, who evinced the greatest interest in all that they saw. From twelve to two the grounds were reserved for native ladies, but were again thrown open to the public until eight in the evening. There was also a carriage parade in the afternoon, with prizes for the best turn-outs.

As a first experiment the show was an undoubted success, both financially and otherwise, and it has done much towards interesting the natives in agriculture, and in persuading them to improve the products of their district; in fact, the success was so great, that it is intended to hold an annual show in different parts of the country in successive years.

Several difficulties with which the first show had to contend can be avoided in the next. First and foremost, universal complaints were received that it was impossible to make the natives understand the object of the show. Some thought that it was an ingenious idea on the part of the Government to collect revenue by confiscating all the exhibits, others would not send anything unless they were guaranteed a prize, whilst others thought the only exhibit worth sending was a two-headed chicken or a cat with five legs; in fact, so indifferent were the natives in some districts, that it was only owing to the zeal of the local secretaries that any exhibits were sent at all, some of these gentlemen going so far as to purchase the articles exhibited. However, many of the better class of natives visited the show, and now thoroughly understand its object, and have stated that next year they intend to send exhibits.

The names of many things that were shown are, of course, quite unfamiliar to English ears, but such familiar vegetables as Lettuces, Cucumbers, and Radishes, were well represented. Cocoa-nuts, cotton, gambier, corn, indigo, patchouli, Sugar-

cane, Tobacco, Bananas, Pine-apples, Bamboos, Gourds, and other well-known things were shown. Amongst the productions that are but seldom heard of in this country were such articles as papaya, nangka, ataps, samier, kajang, &c. Several elephants amongst the live-stock exhibits would be a curiosity in this country, and so would game-cocks in the present day, but cock-fighting is by no means extinct in the East.

The balance-sheet, too, is an interesting document. The Government granted 1200 dols., and a subscription-list raised nearly 800 dols. more. Prizes cost some 992 dols.; buildings, 472 dols.; printing, advertisements, coolies, cloth, and lighting took 325 dols.; and after all expenses, there was a balance of about 200 dols.

As the Government wish to encourage the planting of fruit trees in the State, the Government plantations are prepared to supply a varied selection of plants and seeds. *G.*

SCOTLAND.

SCOTTISH HORTICULTURAL ASSOCIATION.

THE monthly meeting of this Association was held on the 3rd inst. at 5, St. Andrew Square, the president, Councillor A. D. Mackenzie in the chair. A paper by Mr. James Riddell, Castle Howard, Yorkshire, entitled "Geographical Influence on Vegetation," was read by his brother, Mr. W. H. Riddell, Edinburgh. Mr. Riddell was awarded a cordial vote of thanks for his paper. A First-class Certificate was awarded to a new seedling Chrysanthemum, raised by Mr. Carruthers, Hillwood, Corstorphine, from seed received from the gardens of the Mikado of Japan, and named The Duchess of York. It belongs to the popular Japanese section, is of a clear primrose-yellow colour, broad twisted petals, much reflexed, and quite hemispherical in form. Being, so far as we are aware, the first Chrysanthemum of high exhibition rank raised in the district, it naturally attracted great attention from the members present. We understand that the Association is arranging for a series of lectures on technical instruction in horticulture, in which the chemistry of garden crops will occupy a leading place. *A. M.*

NOTES FROM OCHTERTYRE, CRIEFF.

When visiting the horticultural exhibition at Crieff, where there were fine collections of vegetables, Apples and Pears worthy of note, I saw in a collection of Pears from Ochtertyre Gardens, in fine form, B urr  d'Assomption, and never tasted a finer-flavoured Pear in September; and its appearance is much in its favour also. This Pear is not widely known in Scotland. From Crieff I went to Ochtertyre, with my friend Mr. Croucher, to see the fine collection of Conifers in Sir Patrick Keith Murray's splendid grounds. Though I have often heard of this delightful seat, yet everything in respect to landscape I found far beyond my expectations. Anyone who has a taste for the beautiful, and can admire Conifers planted under happiest circumstances, may do so at Ochtertyre; a good welcome from the enthusiast, Mr. Croucher, whose delight it is to give all the information of which he is possessed on the management of Conifers, may be depended upon. There are few men who have noted the peculiarities of this grand tribe of plants more closely than he. The picturesque ground, now converted into a pinetum, was formerly a shrubbery, planted about ninety years ago with Hollies, Laurels, &c., with a large mixture of flowering, deciduous shrubs. Though now all removed, they were of much service as protection to the Conifers when the bulk of them were planted twenty-five years ago. Last season forty new varieties were added from Messrs. Veitch's collection, the half of which were varieties of Cupressus Lawsoniana. Mr. Croucher informed us that on these slopes only one failed to grow, showing how well plants brought from the South thrive in this latitude. We were shown a beautiful clump of Cupressus Nutka ensis, containing six varieties; and our attention was arrested by a lovely plant of *C. aurea nova* (of Veitch), a most desirable variety; close beside it stood the silver variety equally beautiful. Of late years, special attention has been given to the glaucous varieties of Conifers, nearly all of which have found a home at

Ochtertyre. After admiring many of these, attention was directed to one of most exquisite colouring, before which even the much-coveted *Picea pungens glauca* pales considerably. Mr. Croucher has named the variety *Picea Engelmanni glauca Veitchii*, to distinguish it from other varieties. It is not my intention to go into details of the species and varieties of Conifers grown here, as over 250 varieties have been planted since 1867. The only tribe which remains to be completed is the Juniper, about a third only of the varieties cultivated being in the collection; and judging from the great enthusiasm existing at Ochtertyre for Conifer culture, the want indicated will be supplied ere long. A notable species, *Abies Veitchii*, planted in 1874, has attained the height of 28 feet; a cone was produced last year on this plant, and figured in the *Gardeners' Chronicle*, 1880, p. 275, fig. 50, and March 1, 1890. The girth of a Wellingtonia (at 5 feet up) is 8 feet 6 inches; and a magnificent old Ash is 25 feet at the same height.

In front of the very substantial and commanding mansion is a terrace with a gravel-walk, running from end to end, 330 yards long, and 10 feet wide, from which are to be seen mountains on the north, east, and west, peak above peak, Ben Voirlich overtopping most of them; and from the top of the house, Birches and Hollies, fronted with Rhododendrons, were admired—forming a beautiful picture on the landscape. Cedars of Lebanon standing boldly above other trees, but associated with other Conifers growing into gigantic form; 100 varieties of Hollies, which have been reduced to seventy by rabbits and field mice, are a striking feature. Turlenn Hill is noted where the highest plantation in Scotland is to be seen. A glimpse is taken of the hardy fruits, where we notice Pear trees on stone walls laden with fruits. Conspicuous were B urr  Diel, Souvenir du Congr s, B urr  d'Assomption, Catillac, Marie Louise, B urr  Clairgean, and Williams' Bon Chr tien. Apples on low walls were of great size. Lord Sullfield, Duchesse d'Oldenburgh, Eckliuville, and Warner's King, were among the best. This is a seat, like many others in Perthshire, one can visit again and again with pleasure and profit. *M. Temple.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

OCTOBER 10.—Present: Mr. McLachlan (in the chair), Prof. Church, Dr. M ller, Mr. Blandford, Rev. W. Wilks, Dr. Bonavia, and Rev. G. Henslow, Hon. Sec.

Peach Disease.—With reference to the diseased Peaches brought to the last meeting by Dr. M ller, Mr. G. Masee, of Kew, reports as follows:—"The Peach disease is caused by the fungus *Glaeosporium fructigenum*, Berk., or rather by *G. reticulorum*, Berk., which is in reality only the former species modified by the host, as proved by cultures. In America, where the disease is too well known, and has also attacked Grapes during the last two or three years, it has been found that the fungus can be kept well under control by two or three sprayings of potassic sulphide ($\frac{1}{2}$ oz. to a gallon of water) applied in June or July. Of course, it is too late to attempt spraying this year, but all diseased fruit should be removed and destroyed to prevent the diffusion of the spores." Dr. M ller observed that he had seen the disease twice soon after the setting of the fruit. This appeared to be locally arrested in growth where the fungus occurred, the rest of the Peach growing normally.

Fruiting of Pyrus japonica.—Mr. Blandford exhibited specimens, and commented on the very large size to which the fruit had attained this year. They do not appear to be capable of being put to any use as yet.

Oranges from Australia.—Dr. Bonavia communicated the following remarks on a curious phenomenon connected with Oranges:—"On July 12, 1893, a box of Oranges was shipped to me by a friend in South Australia. It contained four varieties of the so-called 'Portugal' Orange, viz., the 'Navel' Orange, a large and a small Blood Orange, and the Egg Orange. Each Orange was wrapped in tissue paper, and the whole were packed tightly in hay. They reached me after having been about five weeks on the sea in very sound condition, with the exception of one which was spoilt. Probably this had been bruised before it was packed.

"On the voyage the Oranges sweated and the hay

became damp, for when I opened the box a musty smell of damp hay pervaded the whole box; and now comes in an interesting point.

"I unpacked all the Oranges and freed them from paper and hay. They all had a musty smell. I washed some of them and dried them. Apparently the musty smell was completely removed from the outside; but on cutting open the Oranges every one of them had not only a musty smell in the juice carrels, but also a peculiar musty flavour.

"It would appear that the mustiness of the damp hay had penetrated through the peel, and pervaded the whole interior of the Orange, giving a peculiar and unpleasant flavour to the juice.

"There was no difference in the four varieties. They were all equally contaminated by the musty smell and flavour, although otherwise quite sound, and when washed the mustiness could not be detected in the rind.

"I ate some of them every day, and by keeping the mustiness of the juice became less, till about the fourth week after unpacking the mustiness in the juice was scarcely perceptible.

"All the varieties were rather thick-skinned, and were very juicy, and all kept very well. Probably the soft hay packing may have had something to do with their not getting bruised on the way. The 'Navel' Oranges were more juicy than the same variety we get in London from California.

"I hardly know how to explain the contamination of the juice by the musty air in the box. The peel contains a large quantity of essential oil. This may have absorbed the musty aroma, and then, when saturated, passed it on to the juice vesicles, which also contain a considerable proportion of essential oil. By keeping and exposure to the air, this process may have been reversed."

With regard to the cause of the flavour of the Oranges, Professor Church explained it by the fermentation of the hay and osmosis causing the scent to enter; then transpiration would subsequently bring about the odour externally. It was remarked by Mr. McLachlan that certain Oranges were eaten green in Java, Ceylon, &c. Dr. Bonavia added that such became yellow subsequently, though they were edible in the green state. They have been illustrated by Miss North among her paintings at Kew.

Pear Disease.—Messrs. J. Cheal & Sons forwarded samples of Plumaston Duchesse Pears affected apparently by a fungus, giving the fruit a warty appearance. They were referred to Kew for examination.

Disased Salishuria.—A branch of this tree was received from South Dorset, evidently in a very enfeebled condition. It was the general opinion that the mild, damp, maritime climate of the situation was unfavourable to it, and the probable cause of its unhealthiness.

Birds, Wasps, and Pears.—Mr. Blandford observed on the habit of tomtits, which he had seen pecking holes in Pears, which gave wasps access to attack the juicy tissues. Application of nicotine to the wound kept them at bay for six hours. Mr. Henslow added that he had noticed wasps attacking mealy bugs in a viney before the Grapes were ripe. Mr. McLachlan added that he had noticed tomtits attacking Cobnuts for the purpose of extracting the grubs within them.

Synanthly in Cypripedium.—Sir Trevor Lawrence exhibited a plant having two flowers welded into one. It possessed one lower sepal, two large ones above, three nearly equal sized petals, two perfect labella, and two staminodia; the ovary showed the fusion by a longitudinal groove.

A Rhododendron Hybrid.—Mr. Henslow exhibited a specimen received from Mr. Veitch, the result of crossing "Lord Wolseley" by the hetero "Indico-javanicum," this having been the result of crossing "Lord Wolseley" with *Azalea indica Stella*. The flowers were more or less malformed, having a strong tendency to be polypetalous; the stamens were occasionally epipetalous or sub-petaloid. The form of the flower showed no improvement on that of *Indico-javanicum*, though it was a little brighter in colour (orange).

Oak Galls.—Some curious many-pointed galls on the acorns of Oaks at Versailles were sent by Mr. Belt of Ealing. Mr. McLachlan reports that they are the product of *Cynips calycis*, and that this species of gall has never been found in this country.

Rayless Matricaria Chamomilla.—Mr. Henslow exhibited specimens found by road sides in Ealing. They appeared to be particularly abundant last year. Seed obtained failed to germinate in the present dry season.

READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

Last year, at the second annual show of hardy fruit in connection with the above, held at the Abbey Hall, Reading, it was suggested that the excellence of the exhibition warranted the promoters in making it more public and popular, the visitors being limited to subscribers to the Society and their friends. Acting upon this suggestion, the executive decided to hold their third show in the small Town Hall, on Thursday, October 12. Their action met with the approval of those interested in the undertaking, and a large number of persons patronised the show, the proceeds of which—a sum probably exceeding £5—will be devoted to the funds of the Royal Gardeners' Orphan Fund. The object of the exhibition is really an educational one, and it is satisfactory to know that some of the best growers of outdoor fruit in the neighbourhood of Reading have contributed to the show.

Mr. J. Pound, jun., gr. to Mr. Alfred Sutton, Greenlands, Reading, has, ever since the establishment of the association, undertaken the duties of honorary secretary, and he certainly deserves great credit for the admirable arrangements he made on Thursday. In the carrying them out, he spared neither time nor trouble in the interest of the exhibition, and he was supported by several leading members of the committee. The show was made most attractive and effective by the arrangements of plants on the platform, and tables in the hall, contributed by Mr. J. Bradley of the Tilehurst Nurseries (who also sent Cucumbers and Mushrooms); Mr. Bright, gr. to Mr. Karlake, Whiteknights Park; Mr. Woolford, gr. to Mr. Alfred Palmer, East Thorpe, Reading; and Mr. Turton, gr. to Mr. J. Hargreaves, Maiden Erlegh.

Last year there were 954 dishes staged, but this year the total number amounted to 114—a considerable increase, although some persons who sent fruit to the Abbey Hall in 1892 did not, from various causes, send on this occasion. A table was set apart for fruit to be named, on which were upwards of seventy dishes, and the committee came to satisfactory conclusions with regard to these.

Appended is a list of the contributors to the show, with the number of dishes they sent, the list being made up by the hon. sec. as accurately as possible:—

Mr. Stanton, gr. to Mrs. Noble, Park Place, Henley, 140 dishes; Mr. Turton, gr. to Mr. Hargreaves, Maiden Erlegh, 100; Mr. J. Pound, jun., gr. to Mr. Alfred Sutton, Greenlands, Reading, 6; Mr. Ireland, gr. to Mr. Howard Palmer, Devonshire House, Bath Road, 18; Mr. Leaver, gr. to Mr. Leonard Sutton, Hillside, Reading, 13; Mr. Smith, gr. to Mr. M. H. Sutton, Cintra Lodge, Reading, 21; Mr. Hott, gr. to W. T. Crawshay, Caversham Park, 42; Mr. R. Webb, Beenham, 33; Mr. Bright, gr. to Mr. Karlake, Whiteknights Park, 14; Mr. Dockerill, gr. to Mr. G. W. Palmer, M.P., Elmhurst, Reading, 72; Mr. Chamberlain, gr. to Mr. F. M. Lonergan, Cressingham, 82; Mr. Durman, gr. to Mr. J. W. Workman, Reading, 24; Mr. White, gr. to Mrs. R. Y. Bazett, Bath Road, Reading, 6; Mr. F. B. Parfitt, College Road, Reading, 12; Mr. Bowie, gr. to Mr. A. W. Sutton, Satherlands, Reading, 67; Mr. Coates, gr. to Mr. R. Hewitt, St. Mary's Hill, Reading, 23; Mr. Wilson, gr. to Mrs. Bland-Garland, Lower Redlands, 13; Mr. Alexander, gr. to Dr. Richardson, Oxford Road, 8; Mr. W. L. Walker, Bulmershe Road, 15; Mr. George Hinton, gr. to Major Battiscombe, Bath Road, 12; Mr. Bristow, gr. to Major Thoyte, Sulhamstead Park, 30; Mr. Dearlove, gr. to Miss King, Brookfield, Burghfield, 20; Mr. Cooper, gr. to Mr. James Simonds, The Redlands, Reading, 18; Mr. Wise, gr. to Mr. W. S. Parter, Summerlease, Reading, 42; Mr. Pound, gr. to Mr. George May, The Warren, Caversham, 13; Mr. J. Hunt, gr. to Mrs. Wells, King's Road, Reading, 16; Mr. Hearn, gr. to Mr. John Heelas, Whiteknights, 27; Mr. Townsend, gr. to Sir William Farrer, Sandhurst Lodge, 21; Mr. W. Lees, gr. to Mrs. Marsland, The Wilderness, Earley, 65; Mr. Farey, gr. to General Radcliffe, Balmore, Caversham, 58; Mr. Woolford, gr. to Mr. Alfred Palmer, East Thorpe, Reading, 32.

The largest contributor to the show will thus be seen to be Mr. Stanton, gr. to Mrs. Noble, of Park Place, Henley, who staged no fewer than 80 dishes of Apples, and 60 of Pears, and all the fruits were very choice, and were much admired. Mr. Pound, jun., sent six dishes of Pears, which attracted great attention; one dish of Uvedale's St. Germain variety was of enormous size, the five fruits weighing 9 lb., and

the heaviest scaling 2 lb. 1½ oz. The Apples exhibited by Mr. Turton, gr. to Mr. Hargreaves, were remarkable for number, size, quality, and high colour, notable among the 105 dishes shown by him being Bramley's Seedling. Other handsome dishes from the same grower were specimens of Annie Elizabeth, Peasgood's Nonsuch, and Mère de Ménage. Mr. E. Webb, of Beenham, the well-known amateur fruit grower, had a very fine collection of Apples, which he set up very effectively in baskets, and he deserves great credit for having produced such an excellent lot, considering that the fruit was grown under adverse circumstances. Another amateur contributor was Mr. F. B. Parfitt, of College Road, Reading, who staged several fine dishes of Apples, including specimens of Bismarck, a fruit of great size, crimson-coloured, prime flesh, and a heavy cropper. Mr. Hott, gr. at Caversham Park, had upwards of twenty dishes of Pears of large size and excellent quality, and Mr. Dockerill, gr. to Mr. G. W. Palmer, M.P., sent a nice lot of Melons &c. *Extract from "Reading Mercury."*

THE WEATHER.

[BY the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

MARKETS.

COVENT GARDEN, October 19.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, &c.]

PRICES RULE AS LAST WEEK.
PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

POTATOS.

Arrivals are very heavy, and trade slow, prices rule very low, except for best samples. Best Beauties making 100s. to 120s.; Abundance, Bruce, 80s. to 90s.; other kinds, 42s. to 60s. J. B. Thomas.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

BIRCH BARK.—Please state the name of that extremely sweet-smelling grass that the Canadian Red Indians use for putting into various kinds of Birch-bark work, and making sweet-smelling ornaments of? They call it sweet hay, and sweet Indian grass. Can one get the seeds here, and does it smell as sweet if grown here? J. R. H. [The bark itself is highly-scented, and needs no grass to add to its perfume. ED.]

NOTICES TO CORRESPONDENTS.

BLACK HAMBURG POT-VINES: *Perplexed*. The Vine sent was furnished with a large quantity of what had been at one time healthy roots, but which had died back several inches from the points. The failure of the Vines to make good growth is due to this loss of roots, but what caused this loss is but conjecture—probably affording the Vines more water than they needed after the last shift into 11-inch pots, or the too-free use of artificial manure. The contrast between the large mass of roots and the thin unripened cane is very marked.

BOOKS: A. R. D. There are several handbooks which treat of the art of growing Mushrooms. *Mushrooms for the Million*, by J. Wright, published at 171, Fleet Street, E.C., is one of the best.

CARNATION MISS JOLIFFE: E. B. Like many other so-called florists' flowers, Carnations frequently sport, giving on the same plant flowers of different colours. There is no remedy for sporting in flowers and foliage, nor are there any certain means of producing sports.

CORRECTIONS.—*Gladiolus platyphyllus*, p. 456, fourth line in first paragraph, for long-leaved read long lost; and fourth line from end, for firm read charred. A. B. In Names of Fruit, for Beurré Charnensis read B. Charneuse.

CYPERUS VINE FROM FLORIDA: W. H., *Glamorgan-shire*. We are unable to find this plant in any list. It is probably a mis-spelling for Cyprus, &c., and the Americans call all kinds of trailing plants Vines.

FRUIT TREES: J. W. If your trees are making too much wood, prune them less severely, the more you cut them the stronger will be their growth. You had also better lift them at once, at the same

time cutting off all thick fleshy roots that have descended into the subsoil, and fill in again with fresh loam, but adding no manure. If your trees are very large, instead of lifting them, you might take out a trench on one side of the tree only, about 3 feet from the stem, and then with a fork gradually and carefully work away the soil from the roots, and treat them the same as if you were lifting the trees. Be sure you cut away any tap roots that are in cold rank soil. The other side of the trees might be served similarly next year. This will apply to the Plums as well as the Pears. We would advise you to read the long correspondence that has lately taken place in our columns on "Root-pruning," "Summer-pruning," and "The Lifting of Fruit Trees."

FRUITING OF RASPBERRIES AND STRAWBERRIES: J. B. An exceedingly common occurrence this season.

FUNGUS: L. T. *Phallus impudicus*, L., in the "egg" state, or enclosed in its volva.

GALLS: W. H. The Artichoke gall.

INSECT: Arthur Pope. We have no record of our having received them.

LARGE PITMASTON DUCHESS PEARS: C. Kemp, *Sole Street House, Faversham*. The six fruit, weighing 7 lb. 9 oz., were unusually fine specimens.

NAMES OF PLANTS: J. B. 1, Specimen insufficient; 2, *Acer campestre*.—J. B. 1, 2, and 3, All varieties of *Cupressus Lawsoniana*; 4, *Thuja occidentalis*; 5, *Pinus Strobus*; 6, *Pinus sylvestris*.—Hugh E. *Juniperus nana*.—A. *Phrynium variegatum*.—M. C. Your specimen quite withered, is insufficient for determination.—F. L. M. A. (large one), *Oncidium varicosum*; B. (small one), *Oncidium*

raniferum.—J. Ewing. *Juncus lamprocarpus*, abnormal growth.—Thomson & Co. *Panicum capillare*; it seeds plentifully.—E. Arnold. 1, *Adiantum Williamsii*; 2, *Davallia hirta cristata*; 3, *Adiantum cuneatum gracileps*; 4, *Pteris Victoria*; 5, *P. cretica cristata*; 6, *Polystichum angulare cristatum*.—W. B. G. 1, *Aster confusus horizontalis*; 2, *Cratægus pyracantha*; 3, *Alyssum saxatile*.—Wallace. *Neja gracilis*, so far as we can judge by the specimen sent.—J. B. 1, *Lantana*, garden variety; 2, *Coprosmia Baueri variegata*; 3, *Chlorophytum (Anthericum) lineatum variegatum*; 4, *Aster* not recognised; 5, *Veronica spicata*; 6, *Potentilla*, garden variety.—F. F. R. So far as we can tell from the specimens sent: 1, *Juniperus*; 2, *J. virginiana*; 3, *J. communis*; 4, *Retinospora plumosa*; 5, *R. plumosa*; 6, *Juniperus* sp.; 7, *Thuja gigantea*; 8, *T. occidentalis*; 9, *T. occidentalis*; 10, a *Labiata* not recognised; 11, *Weigela rosea*; 12, *Cupressus Nutkensis*.—E. F. Hazleton. 1, *Montbretia crocosmiflora*; 2, *Coreopsis grandiflora*; 3, *Kerria japonica*, fl.-pl.; 4, *Helianthus rigidus*; 5, *H. multiflorus*; 6, *H. multiflorus*, fl.-pl.—J. W. 1, *Hordeum murinum*; 2, *Agrostis alba*; 3, *Aira flexuosa*; 4, *A. cæspitosa*.—T. R. There is a *Cratægus grandiflora* sent out by the Belgian nurserymen, but we are not sure that it is the same as your plant. If spiny, it may be a seedling form of *C. crus-galli*.—D. P. 1, *Pulmonaria officinalis*; 2, *Chrysanthemum coronarium*; 3, *Kerria japonica*.—D. S. *Nigella damascena* (*Ranunculaceæ*).—H. C. *Ipomœa Bora Nox*.—G. H. S. 1, *Polygonum cuspidatum*; 2, *Lycycteria formosa*; 3, *Goldfussia isophylla*; 4, *Gloxinia maculata*; 5, *Phytolacca decandra*; 6, *Bœhmia species*; 7, *Buddleia auriculata*, illustrated in *Gardeners' Chronicle*, November 12, 1881; 8, *Habitia tamnoides*.—H. W., *Glamorgan-shire*. *Dendrobium moschatum*.—H. M. 1, not received; 2, not recognised without flowers; 3, *Carduus eriophorum*; 4, *Rhamnus catharticus*.

ODONTOGLOSSUM-HOUSE: D. J. A house 14 feet high to the apex is scarcely adapted to the cultivation of *Odontoglossums*, but provided the glass is clear and good, the panes large, and it can be kept very clean, so as to admit as much light as possible when unshaded, you should be able to cultivate these plants fairly well. The fluctuations of temperature will not be so abrupt as in a small house.

ORCHARD HOUSE APPLES AND PLUMS: A *Plymouthonian*. Four Apples ripe in July and August: Beauty of Bath (Cooling's), Juneating Red, Juneating White, fruit of this one to be eaten from the tree, as it will not keep; and Irish Peach—all of these do well on the Paradise stock. August and September varieties of Apples: Early Harvest, Grand Sultan, Kerry Pippin, Yellow Ingestrie, Lady Sudeley, Williams' Favourite—these are also good on the Paradise stock. October, November, and December Apples: Pitmaston Pine, Golden Keinette, Ribston and Cox's Orange Pippin, Cornish Aromatic, Jennet Moyle. Later varieties, Ashmead's Kernel, Brownlee's Russet, *King of Tomkins Country, Old Nonpareil, Duke of Devonshire, *Melton Apple, *Northern Spy, Adams' Pearmain, Syke House Russet and Scarlet Golden Pippin, *Reinette du Canada. The above include several varieties which ordinarily do not succeed out-of-doors, except on a warm wall, but come of good quality under glass. These are marked with an asterisk. The varieties of Plums may consist of Early Mirabelle, Golden Esperen, De Montford, Reine Claude de Bayay, Coe's Golden Drop, Jefferson, Kirke's, Denniston's Superb, earlier than Green Gage by nearly two weeks; Green Gage, and Reine Claude de Count Athems—these are dessert Plums. Kitchen vars. may be the following:—Denbigh, Diamond, Mitchelson's, Pond's Seedling, Victoria, Prince Engelbert (an early Plum), Wyedale (very late). The size of pots used may vary from 10 to 12 or 15 inches, according to size of roots, but in a usual way the first size is sufficiently large to begin with. Apricots succeed very well under orchard-house treatment. In all cases, the soil employed should be rich pasture-loam chiefly, and it should be rammed tightly into the pot. See that the drainage is good.

PLANTS FOR FLOWERING IN THE WINTER: G. P. Had you read the Calendarial notes of "Plants under Glass" in our last issue, you would have observed that Mignonette is the name of a variety of *Rosa polyantha*, and not the sweet-smelling herb. Moreover, all good gardeners

know that if they would have well-expanded trusses, and a good succession of them on their zonal Pelargoniums, a temperature of 50° to 55° is necessary—in the cold greenhouse the plants blooming but poorly. The *Salvias* are the better for a little more warmth than the greenhouse affords; and so with the other things you name. *Linum trigynum* will certainly not do much good in the greenhouse during the winter, although it may be a suitable place for it in the summer.

RUST ON PLANTS: *Constant Reader.* The name Malmaison alone is too vague. Are the plants Carnations of the variety *Souvenir de la Malmaison*, or *Roses* of that name? If the former, and they are affected with large round light brown spots on the foliage (*Septoria dianthi*), throw them away—there is no known cure. If it be orange rust on the Rose, spray with sulphate of copper, or cut them off and burn at once.

SULPHUR AND MEALY-DUG: *A.* If you burn sulphur in the houses at any season the trees would suffer greatly, and perhaps perish. Try a winter dressing of Gishurst's Compound Soap, at the rate of 4 oz. to the gallon of water. For Peach trees in houses, the application should be at dead of winter, or, at any rate, before any movement takes place in the buds. Shovel out the upper crust of the border, and as a further preventive of attack, limewash the walls, going below the level of the soil, and wash other surfaces with soap-suds. You will find clear soot-water used in syringing the trees to have a deterrent effect.

TWO-FACED DAHLIA: *J. Day.* Not so uncommon as you suppose; nor quite so objectionable as persons one meets suffering from same malformation. Hope there are no gardeners so affected. (Fruits next week.)

VIOLETS IN COLD FRAMES IN LONDON: *Cigarette.* Violets, either under glass or out-of-doors, are rarely now worth cultivating in London, the fogs, blacks, and smoky atmosphere killing them in a season or two. It was wrong practice to plant out the old plants in the late spring, the rooted offsets should have been chosen for raising plants to flower in the winter. Your plants having had seed-vessels upon them is proof that they flowered during the time they were in the open ground. The flowers that produce seed are often inconspicuous. Provided the conditions are suitable, Violets can be grown in pots in a greenhouse, but it is then desirable to retain four or five of the summer runners which the offsets always put forth in May, pegging them down, but not letting them or the mother plant push out other runners. They must have plenty of water in dry weather, and a slight manure-water. In September or October the mother plants, and the rooted runners attached, may be lifted, with balls of soil, and put into large pots.

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered

HOT-WATER BOILERS,

Others with TUBES, SHELVES, & HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

May 27, 1893, The Dell, Englefield Green, Surrey.
ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.
Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,

H. BALLANTINE, Head Gardener to Baron Schröder.
We have a similar Mill and set of Pumps in hand for Lord Northbourne.

SANKEY'S famous GARDEN POTS

* Bulwell Potteries, Nottingham. *

Messrs. Dicksons, Limited, Chester, write:—"The Flower Pots you have so largely supplied us with are light, strong and well made, and in every respect highly satisfactory."

Messrs. Richard Smith & Co., Worcester, write:—"We beg to say that we are highly satisfied with your 'Garden Pots,' they are well made, light, yet strong, and we like them better than any other we have ever used."

Mr. William Bull, 536, King's Road, Chelsea, London, writes:—"For nearly thirty years I have been using your 'Garden Pots,' and still find them the best and cheapest."

Largest Manufacturers in the World. No Waiting. Millions in Stock. Carriage and Breakage Free on £10 Orders. Half Carriage on £5 Orders. Samples Free.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus, Will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kinds of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

Apply for Terms.

SPECIMEN FREE. Price 2d.

GARDENER (SECOND), in a good Establishment.—Age 26; eleven years' practical experience Inside and Out in good places. Good character and testimonials from present and previous employers.—W. H., 8, Dood's Road, Reigate.

GARDENER (SECOND, or in a good Nursery.—Age 25; six years' good character.—HARBAGE, 25, Wellesbourne Grove, Stratford-on-Avon.

GARDENER (UNDER).—Age 21. Four and a-half years' experience Inside and Out; good character.—H. BATES, The Gardens, Benningbrough Hall, York.

GARDENER (UNDER), in Kitchen Garden and Pleasure Ground.—Single; little experience in Inside Work. Abstainer.—A. GARWOOD, Sargent's Yard, Hall Street, Long Melford.

GARDENER (UNDER, or THIRD).—Age 18; has had experience Inside and Out. Nearly four years' excellent character from last place.—E. SMITH, Penn Court, Wolverhampton.

GARDENER, and Useful Man.—A Single Man, abstainer and non-smoker, desires a situation; satisfactory references.—GARDENER, 35, Whistler Street, Drayton Park, Highbury, London, N.

GARDENER or FOREMAN.—Practical experience in Private and Trade. Good references and testimonials.—VITTS, Alpha House, High Street, Roehampton Surrey.

GROOM-GARDENER.—Age 24; able to take sole responsibility. Handy in House and Garden. Highly recommended.—H. HATCHER, East Tytherley, Stockbridge, Hants.

ROSE GROWER, Inside or Out.—Has been many years a successful exhibitor at the National and Provincial Shows. Good references.—A. B. C., 8, Parliament Street, Small Heath, Birmingham.

GROWER of Stove and Soft-wooded Plants and Ferns, Make up Wreaths, &c.—Eleven years' experience. Good references.—C. S., Fountain Nursery, Edmonton.

To Nurserymen.

GROWER (Soft-wooded), for Market, well up in Ferns, Bouvardias, Marguerites, Tuberoses, and Lily of the Valley, &c., and general Market Stuff. Twenty-six years' experience.—M. M., The Lodge, Aberdeen Park, Highbury, N.

GROWER (INSIDE, or GENERAL); age 26.—T. JANNOCH can with confidence recommend his Foreman, who has been with him three and a-half years. Ferns, Palms, Stove and Greenhouse Plants, Bulbs, Forcing Cut Flowers, Wreaths, Bouquets, &c.—Apply, T. JANNOCH, Lily Nursery, Dersingham, King's Lynn.

PROPAGATOR and PLANT GROWER.—Many years in London and the Provinces.—T. M., Messrs. Turner & Kirk, Nurserymen, Heaton Chapel, near Stockport.

PROPAGATOR and GROWER of Bedding, Pot, and Cut Plants, Palms, Ferns, Forcing Lily of the Valley, Bulbs, &c.—P. SPARY, 15, Pentlow Street, Putney, S.W.

FOREMAN, MANAGER, PROPAGATOR.—Thirty years' experience; ten years manager in one of the largest Nurseries near London. Understands the cultivation of Plants, choice Cut Flowers, Fruits, Mushrooms, &c., for Market.—JOHNSON, The Vineries, Paignton, South Devon.

NURSERY FOREMAN; age 33, married.—Messrs. FITCHER & MANDA will be pleased to recommend their Foreman, Robert Hamill, who is leaving us on account of our giving up the European Branch. Fourteen years as Foreman in leading London and Provincial Nurseries. Thoroughly practical, energetic, and reliable. First-class reference and excellent testimonials. Could travel if required.—The United States Nurseries, Hextable, Swanley, Kent.

FOREMAN (Outside or General).—Age 26; life experience in all branches. Excellent testimonials. Leaving through people going away.—W. FULFORD, Hayes, Middlesex.

FOREMAN, or SECOND, in a good establishment.—Age 26, single; life experience. Abstainer. Good references.—J. R., 145, Fairbridge Road, Upper Holloway, N.

FOREMAN (GENERAL).—Age 30; twelve years' experience in Orchids, Fruit, Stove, and Table Decorations. Two years' present character. Life ab-tainer.—THOS. BROCKBANK, 10, Ulric Street, Camberwell, S.E.

FOREMAN (FIRST), Journeyman in good establishment; age 25; ten years' experience.—Mr. ERBUTT, Drakehowe Gardens, Burton-on-Trent, can with confidence recommend J. Grix as above.

FOREMAN, or SECOND, in a good establishment.—Situation required as above by young man (age 24). Twelve years' good all-round experience Inside and Out. Used to Fruit-houses, &c., House and Table Decorations.—F. WILCOCKS, Foreman, Croxton Park, St. Neots, Hants.

FOREMAN (Inside, or General).—Age 25; eleven years' experience in all branches in good establishments. Good references.—C. W., The Gardens, St. Catherine's Hill, Rose Bank, Worcester.

FOREMAN PROPAGATOR or GROWER.—Age 33, married; well-up in Grapes, Tomatos, Cucumbers, Strawberries, and the usual run of Pot and Cut Market Stuff, putting up New Glass, and Hot-water. Life experience. Dren-gaged.—F. ARCHER, 90, Gib-on Buildings, Stoke Newington, N.

FOREMAN (Inside or General).—Age 26; two years in previous situation as Foreman. Thirteen years' experience in Fruit, Stove, and Greenhouse Plants, Orchids, and general work.—J. HYGATE, Brighton Cottage, Handcross, Crawley, Sussex.

FOREMAN (GENERAL, or Plant and Fruit); age 24.—GEO. ABBEY, Avery Hill, Eltham, Kent, can highly recommend H. Bishop. Eleven years' experience in first-class situations, including two here.

JOURNEYMAN, Inside, under a FOREMAN.—Age 20; six years' experience. Good references.—A. HOBBS, The Gardens, Langford House, Lechlade.

JOURNEYMAN in Nursery or Private Garden.—Age 19; five years' experience. Good characters.—C. BUNNS, Bouds Green, New Southgate.

JOURNEYMAN.—Age 22; seven years' experience in good Gardens and Nurseries. First-class references from present and previous employers.—F. WATER-TON, Pitcher & Manda, Hextable, Swanley, Kent.

JOURNEYMAN (SECOND),—Age 20; two years in a good establishment, and some Nur-ery experience. Strong and healthy. Bothy preferred. Good character.—GARDENER, Cookham Rise, near Maidenhead.

JOURNEYMAN (Inside), in a good establishment; age 21; seven years' experience.—W. FLOOD, Gardener, Wichnor Park, Burton-on-Trent, would be pleased to recommend A. Earp as above.

JOURNEYMAN, Inside or Out.—Age 23; nine years' experience. Good reference.—W. E. SMITH, 84, High Street, Sydenham, S.E.

JOURNEYMAN, in either Plants or Fruit, or in the Houses.—Mr. JONES, until lately Gardener at Sutton Hall, Yorks, would be pleased to recommend J. Smale, who has been with him two years, as above.—J. SMALL'S, Campbell Terrace, Easington Lane, Fencehouses, Durham.

TWO GARDENERS.—Situation wanted by by strong Young Man (age 20). Inside and Out. Good character.—G. F., Bushey House, Terington Gardens, Eastbourne.

TWO GARDENERS.—Situation wanted by a youth (age 18) under a good Gardener. Steady and industrious, willing to be useful. Good character from last employer.—J. BREACH, Priors Court Lodge, near Newbury, Berks.

TWO GARDENERS.—ROBERT SELL, Gardener, Oshaston Hall, Hinckley, seeks a situation for his son as IMPROVER or JOURNEYMAN. Age 18. Three and a half years' experience.

TWO NURSERYMEN.—A young man, age 24, seeks permanent situation under a Foreman; nine years' experience in Growing Soft-wooded Stuff.—H. D., 48, Graham Road, Wimbledon, Surrey.

TWO NURSERYMEN.—Situation wanted in a Nursery. Market preferred. Experienced. Age 22.—E. WARNER, 16, Eastbank Road, Hampton Hill, Middlesex.

TWO NURSERYMEN.—Situation wanted in a good Nursery; Inside; age 21. Good character from present employer. Six years' experience.—THOS. FAULKNER, Adwood, Chesham-Hume, Stockport.

TWO NURSERYMEN.—Young Man (age 20) seeks a situation in a Nursery, under Glass; five years' experience.—T. H. P., Belyedre, Lower Caversham, Oxon.

SALESMAN or GROWER.—Age 28; good experience of Palms, Ferns, &c., or could manage branch business. First-class references.—W. B., 1B, Knightsbridge Green, S.W.

SEED TRADE.—Advertiser (age 31), seeks re-engagement. London. Wholesale preferred. Twenty years' experience. Thirteen years in previous situation. Highest references.—T. W., 41, Wellington Street, W.C.

SEED TRADE.—Situation wanted as SHOP-MAN, or HEAD ASSISTANT (age 23). Seven years' practical experience in all departments. Excellent references.—SHOPMAN, W. Leighton, 89, Union Street, Glasgow.

To Nurserymen and Florists.

SALESMAN, or FURNISHER.—Age 27. Good experience of West End, and not afraid of work. First class references.—W., 33, Brookville Road, Fulham, S.W.

SALESMAN or CLERK.—Advertiser seeks situation as above. Well up in all branches of the Trade. Good Book-keeper, also good hand at Wreaths, &c.—ACTIVE, 35, Cornwall Street, Fulham, S.W.

SHOPMAN.—Seventeen years' experience in first-rate houses. Twelve years in present situation. Good testimonials, highly recommended by present employers.—D. S., Messrs. HURST AND SONS, Houndsditch, London.

SHOPMAN; age 22; Swiss.—Situation wanted as above; speaks French, German, and English. Good references.—A. Z., 107, Charlotte Street, Fitzroy Sq., W.

SHOPMAN, CLERK, or MANAGER.—Age 27; thoroughly West End experienced in all branches. Wages moderate. Country not objected to.—W. HORTUS, 309, Regent Street, W.

SHOPMAN desires re-engagement.—Age 22; seven years' experience in Seed, Bulb, and Nursery Trade.—G. A., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SHOPMAN.—Situation wanted by a young Man (age 22). Thoroughly experienced in Seeds, Plants, Bulbs, and Cut Flowers. Good references.—A. B., Thos. Haw, Seed Merchant, Rawson Place, Bradford.

HOUSE CARPENTER.—JAMES BROWN, House Carpenter to the late Lord Northesk for thirteen years, is open to engage with any Nobleman or Gentleman in a similar situation; left through a death; good character.—JAMES BROWN, Exton, Bishop's Waltham, Hants.

STOKER.—Age 24; used to doing repairs in spare time; good character.—A. OSBORNE, Barton, Torquay.

FLORIST'S ASSISTANT.—A Continental Florist's Assistant, with a good knowledge of the general Flower Business (Furnishing, &c.), wants to fill up spare time in a Floral Establishment, or to Assist a Flower Merchant at Covent Garden.—Particulars to W. W., 17, Smeaton Road, Southfields, Wandsworth, S.W.

"WOULD YOU BE SURPRISED TO HEAR?" an expression made famous during the great Tichborne Trial, as then used by a certain eminent counsel, was brimful of sarcastic meaning; but when at last they came into popular use, and were repeated parrot-like by every person aspiring to a reputation for wit, they became such an intolerable nuisance, that all sensible people boycotted them, and thus in time they were relegated to the dust-bin of forgetfulness. Thus the world goes on its ceaseless round, and fresh changes of taste keep cropping up. The popularity, however, of Holloway's Pills and Ointment only increases with time, for there is no limit to the scope of their usefulness as family medicines.

 For particulars apply to T. HUMPHREY, Auctioneer, Tunbridge Wells.

NEW AND MAGNIFICENT
CYPRIPEDIUM CHARLESWORTHII
 (ROLFE, N. SP.)

Exhibited and unanimously awarded a First-class Certificate by the Orchid Committee of the Royal Horticultural Society, and pronounced by every one to be the most beautiful and charming Cypripedium introduced, causing quite a sensation at the Drill Hall, on Tuesday, September 26, 1893.

The special feature of this novelty is the dorsal sepal, which is quite distinct in appearance and colour to any other known Cypripedium, which will render it exceptionally valuable to the hybridist.

The *Gardeners' Chronicle* says:—"There was a more than usually interesting show of Orchids, but by far the most novel and beautiful exhibit was a plant of Cypripedium Charlesworthii, Rolfe, n. sp., First-class Certificate, an entirely new species, imported by Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, and exhibited by them for the first time, the exhibit coming in for a great amount of attention and admiration. The plant in growth somewhat resembles C. Spicerianum, and the flowers, which are borne on scapes about 3 inches in height, are unlike any other known species. The beautiful flat, upper sepal is 2½ inches wide, broadly orbicular, white, tinged, and veined over its surface with light rosy-purple; the apex alone showing a white marbling. The lower sepals are about 1 inch broad, greenish-white. The petals, which resemble those of C. insigne, are plain-edged, over 1½ inch long, yellowish, tinged with brown; the lip also somewhat resembles that of the Sylhet form of C. insigne, and is similar in colour to the petals. The staminode is very singular, resembling pure white porcelain, the protuberance in the centre being conical in form, and not a single spur, as in C. insigne. It is an extraordinary and beautiful species."

The *Garden* says:—"A First-class Certificate awarded to Cypripedium Charlesworthii, Rolfe, a distinct and decidedly novel species, which cannot

be compared with any that we can call to mind. The plant is of dwarf habit, the flowers each having a remarkably fine dorsal sepal, extra large, measuring about 2½ inches each way; the colour a pale pink, suffused with purple, and having a lighter network towards the extremities; the petals are shaded with greenish-brown, so also is the pouch, which is rather small. A greater novelty amongst the species of the Slipper family has not been seen for a long time. From Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford."

The *Journal of Horticulture* says:—"A very remarkable introduction from the East Indies; it is a distinct and beautiful species, very dwarf, with long narrow leaves. The flower stem is only 3 to 4 inches long; the lip is short, green, heavily suffused with bronzy-brown, and the dorsal sepal is very noteworthy—it is broad and rounded, and the colouring is a beautiful soft rose, delicately veined; the staminode is pure white. A feature of the leafage are the rows of dots on the reverse side. The species is a great acquisition (First-class Certificate)."

The *Gardening World* says:—"An interesting collection of Orchids was exhibited by Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, including a handsome new species, named Cypripedium Charlesworthii, from the East Indies."

In offering this great novelty, we beg to state that we are the sole importers of this plant. We shall be very pleased to quote size, price, and full particulars. Inspection cordially invited.

CHARLESWORTH, SHUTTLEWORTH & CO., Wilmer Road, HEATON, BRADFORD.

JOHN COBBAN AND SON, Seedsmen, Market Place, Rotherham.

OUR

CHRYSANTHEMUMS.

Free inspection throughout the week (Sundays excepted). Our House, 160 feet by 26 feet wide, is one of the finest and most interesting sights to be seen, replete with many seedlings of great value; also 433 new kinds from China, Japan, France, and Italy, together with Sixty of the choicest American kinds, including **GOLDEN WEDDING**, introduced by us, and of which we hold a large and fine Stock—should be pleased to quote Lowest and Special Prices for Plants or Cuttings of this or any other of our 1400 Varieties.

Our Complete ILLUSTRATED and DESCRIPTIVE CATALOGUE of the whole family, new and old, sent post-free.

H. CANNELL & SONS,
SWANLEY, KENT.

CHRYSANTHEMUM EXHIBITION.

NORMAN DAVIS begs to intimate that his magnificent Exhibition of these popular flowers is now open, free of charge. No one interested in Chrysanthemums should fail to visit this, "the oldest and best trade show," (Open all Sundays in October for private inspection only.)

Notwithstanding the splendid Novelties distributed by me last season, and which are giving such unbounded satisfaction all over the country, I feel confident that the present season's Novelties will surpass all previous introductions. Scores of splendid Novelties in all fantastical shapes, and remarkable for their distinctness, are now opening.

CHRYSANTHEMUM NURSERIES, LILFORD ROAD (Near Loughborough Junction), CAMBERWELL, LONDON, S.E.

N.B.—500 Plants of the New "GOLDEN VIVIAND MOREL," and almost as many "WILLIAM SEWARD," are alone worth a visit.

THOMAS GREEN & SON, LTD.,
LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered

HOT-WATER BOILERS,

Others with TUBES, SHELVES, & HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant. The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the **FIRST and HIGHEST PRIZE—a SILVER MEDAL**—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

—FRONT ELEVATION—

—LONGITUDINAL SECTION—

—SECTIONAL PLAN—

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

Gardeners' Chronicle.

SATURDAY, OCTOBER 28, 1893.

WEEDS.*

I SUPPOSE, as the traditional Irishman is mythically said to hit a head whenever he sees it, so you destroy a weed whenever you can. Far be it from me to say you are wrong in so doing, but if you will accord me your patience, I may be able to show you that it may sometimes be as advantageous, or even more so, to turn your enemy into a friend as to annihilate him. Weeds!—I shall not stop to trouble you with a definition of a weed. I do not think any one has succeeded in framing a definition to which exception may not be taken. If we consider it as a plant growing where we do not want it to grow, that will be near enough for our present purpose.

Let us see, now, what it is which gives the weed its power of holding its own, and of dislodging its competitors—perhaps we may gain some lessons from the survey. First of all, it is endowed with the power of adaptation—it makes the best of circumstances. It will grow perhaps where other things will not, or so we say; at any rate, it has the advantage of a good constitution, which enables it to withstand hardships which other plants could not endure. Then each particular weed has some peculiarity which enables it to succeed where others less favourably endowed could not do so.

Look at the Coltsfoot on our railway banks, it smothers everything else, and the reason is not far to seek. It has a powerful underground apparatus, which allows it to lay hold of the soil, and extend in every direction; whilst, above ground, its large broad leaves flattened against the soil, effectually prevent the growth of smaller plants.

Another advantage which some weeds have, as you know to your cost, is the abundance of seed they produce. Mr. Henslow attributes this in part to the fact that many of these plants are self, and not cross fertilised. Again, many of these weeds have exceptional means of dispersal, e.g., the Dandelion with its feathery seeds, or the Goose-grass with its seeds covered with hooks or prickles.

I might, of course, give you many more illustrations, but it is not necessary that I should do so, as they are only too familiar to you; nor is it at all necessary for me to tell you how to deal with your enemies. I would prefer to ask you to consider whether we could not turn what you know about weeds to some advantage, to make them friends instead of enemies. We see how fully they take advantage of circumstances. Cannot

* The substance of an address to the Ealing District Gardeners' Association by Dr. Masters.

we take advantage of them? In illustration, let me ask you, Is Wheat a weed? You will certainly say no; but it was so once. Is Cabbage a weed? Again you will say no; but if you visit Dover cliffs in the summer time, you will find them covered with the grey leaves and bright flowers of the wild Cabbage, which there you would call a weed. Is Sea-kale a weed? No; but that, again, you may find on the beach at Dover. Are Carrots, Parsnips, Celery, Spinach, Beet-roots, weeds? No; you will not call any of these weeds, and yet they all grow wild in our country, and some of them even in our own county. Is Dandelion a weed? I expect you would call it so; but in France it is grown as a salad. Is Hemp a weed, or Buckwheat? I have found both growing as weeds in this very neighbourhood; but on the other side of the Channel you may see acres of Hemp, as in the neighbourhood of Abbeville; and in Holland and Germany you may see acres and acres of Buckwheat in cultivation.

I was reminded of this last autumn, on seeing a piece of waste ground completely covered with Docks in full seed. The sparrows were there in prodigious flocks. They evidently found abundance of food in the despised and neglected Dock, and I have no doubt whatever that we also might turn the profusion of floury seeds of the Dock to some advantage.

And now let me say a word about the Leguminous plants, many of which are common weeds in this neighbourhood, and some of which, as Peas and Beans, are in cultivation. If you look at the roots of these plants, you will find them studded with little knobs, the precise meaning and significance of which have, until of late years, been unknown. Lately it has been discovered that these knobs are the homes of creatures infinitely small, and which are in a broad sense called bacteria. Further, it has been found that these bacteria have the power of converting certain inert and useless combinations of nitrogen into soluble and useful forms; so that while the plant in the absence of these bacteria cannot absorb nitrogenous food, it can readily do so when its roots are tenanted by these organisms. Nitrogen, as you know, is the most important and the dearest plant food that we can purchase, and if the plant can supply its own needs in this respect without cost, so much the better for us.

The practical lessons to be learnt from this are, that it is not necessary to use so much nitrogenous manure, such as dung, for Peas and Beans, or Clover, as for other plants, because the bacteria will supply that for you. Again, it shows the advantage of digging-in, rather than of burning, the haulms of Peas and Beans.

There is, then, one way in which we may, and do, turn weeds to good account, and that is when we allow them to rot in the compost heap. When we do this, we return to the soil something, at least, that has been taken from it, and much also that was not in it before, which has been obtained from the air by the leaves of the weeds, under the influence of sunlight and heat, and the farmer has long ago found out how advantageous it is, especially on light soils, to plough in his green crops, especially if they be of a leguminous nature.

It is, then, not altogether the plant that is in fault. We give it a bad name, and call it a weed; but if we transfer it to gardens and cultivate it, it is no longer a weed, but becomes a useful member of society. On whose side, then, does the blame lie for the existence of the weed? Surely on ours, at least as much as on that of the plants. Suppose we say that there are from 1000 to 1500 plants known to be wild in Great Britain, and five or six hundred in our own county, how many of them do we, "the heirs of all the ages," turn to account? A dozen or twenty, perhaps, certainly not fifty, if we count in the few wild plants, such as Foxglove, Loose-strife, the Water Lilies, and a few others—which we press into the service as ornamental

plants; and the few plants that we do utilise, have they not been handed down to us by our forefathers? Which of them have we added to the list? Can you call to mind a single "weed" which any one of us has attempted to reclaim? The Shirley Poppy is almost the only instance of the kind I can recall in recent times. I own when I see the hoe so busily at work at the task of destruction, I am apt to experience some little feeling of reproach at the chances and opportunities we waste. Those plants, or some of them at least, might be turned to good account, but we do not make the effort. We shall probably not do so until the pressure of necessity compels us.

In this connection I would call your attention to a singular fact. We gardeners run fast enough after novelties among flowers. In a few weeks' time we shall all be as eagerly scanning new varieties of Chrysanthemum as a little while since we were comparing notes about the last new Rose, and we do not hesitate to award a First-class Certificate to a new Orchid or to a newly-introduced plant of merit. But if a new vegetable turns up, who pays any attention to it? A Potato or a Cabbage as like its predecessors as tweedle-dee is to tweedle-dum, gets a certificate, but a new vegetable—we smile, and pass on. I have myself at different times been instrumental in introducing new vegetables—that is, new to this country, plants which the patient Japanese have had the wit to convert from weeds into vegetables. I have distributed them among our best vegetable growers. I have even sent them to Chiswick, but I have never heard anything more about them!

You will excuse me, then, in conclusion, for expressing the opinion that every gardener ought, so far as he is able, to be an experimentalist. It is, it is true, a long business making experiments, and one that requires great patience. We must be able to stand being laughed at, but we must persevere. If our ancestors had not done so, where should we be? It is true, posterity has not done anything for us; but the only way we have of repaying our obligations to the past is to do something in our turn for the future generations, and one way of doing this is by ceasing to call plants bad names, and by turning them, as far as we can, to advantage.

NEW OR NOTEWORTHY PLANTS.

BOLBOPHYLLUM ERICSSONI, *Kränzlin, nov. sp.**

This is by far the most striking new Orchid received for a long time past. Imagine a group of from nine to twelve flowers of a large Chimæroid *Masdevallia*, surmounting a slender flower-stalk, and you will get an idea of this extraordinary new *Bolbophyllum*. The flowers have a yellowish-white ground-colour, the sepals and petals are heavily spotted with dark brown, the lip is red, and has a very strange spongy texture at the disc. As in the other *Bolbophyllums* of the Umbellata group, the flowers of this species also form a circle, but in this instance it is a very large one. The upper sepal is erect, the lateral ones and the petals are spreading; the diameter of each individual flower, including the measurement of the tendrils, is from 8 to 9 inches. The rhizome is very long, creeping, and bears its slender bulbs at long distances apart. The bulbs are thin, erect, from 4 to 5 inches long, and terminated by a leaf much resembling that of a medium-sized *Stanhopea*. It

* *Bolbophyllum Ericssonii*, Kränzlin.—Sepalo dorsali lanceolato longe-caudato, lateralibus oblongis longius caudatis bis v. ter tortis, omnibus trinerviis reticulatis; petalis triangularibus falcatis caudatis quam sepala multo minoribus; labelli hypochilio cordato curvato acuminato spongioso, epichilio v. ungue semicircularem efficiente e basi latiore angustato marginato; gynostemio latissimo infra foveam stigmaticam umbone maximo instructo utrinque in coram acutum producto; androclinio postice dentato; antheram et pollinia non vidi. Flores inter maximos generis, sepalis 10 cm. longa basi fere 2 cm. lata. Caulis primarius seu rhizoma longe repens; rami secundarii seu bulbi angusti lineares monophylli. Folia longe petiolata illis *Stanhopearum* quam maxime similia. Flores albidii brunneo-maculati. *F. Kränzlin*.

is quite superfluous to add more. The description speaks for itself, and shows that there is a grand Orchid at hand. It is a discovery of Mr. Ericsson, one of the oldest Sanderian travellers, and by desire of Messrs. F. Sander, I have named it after their Swedish collector. *F. Kränzlin, Berlin*.

OSTEOMELES ANTHYLLIDIFOLIA.

This new species, introduced by M. le Professeur Cornu, the Director of the *Jardin des Plantes*, has a rather wide range of habitat, being found in the Sandwich Isles, Japan, and even China. It is a greenhouse shrub, of the Rosaceæ family, and may be classed between *Cotoneaster* and Hawthorn; the leaves are deciduous, pinnatifid, like those of some leguminous plants, slightly tomentose, and of a whitish-green; the inflorescences, which cover the plant, are corymbs bearing each from fifteen to twenty white flowers, measuring about two-fifths of an inch in diameter, have five petals, numerous stamens, and resemble the flowers of the Hawthorn. The fruit is a berry, and rather fleshy. This plant is well suited for forcing, as this causes it to flower in January and February.

Shown on Feb. 9 last, before the Société Nationale d'Horticulture de France, by M. Maxime Cornu, this plant received a First-class Award. The plant, described some time since, has been recently introduced into Europe by l'Abbé Delavay, the well-known traveller in the Yunnan. The plant is catalogued for sale by MM. Lemoine et Fils, Nancy.

THE CHEMISTRY OF BACTERIA.*

THE immense variety of substances produced in the vegetable kingdom has always been a source of astonishment to the chemist—the plant is, indeed, the finest chemical laboratory with which we are acquainted. While some kinds of chemical work are common to all plants, there is hardly a species which does not possess some special capacities, which does not produce some products different from its neighbours. When we survey the whole vegetable kingdom, the extent to which this specialisation is carried, and the immense variety of products obtained becomes simply overwhelming. Chemists are still unacquainted with the larger part of the substances produced by plants in the vegetable kingdom.

When we turn from the products of plant-work to the materials employed, our wonder still increases, for these materials are of the simplest kind—water, carbonic-acid gas, oxygen, nitric acid, and a few inorganic salts; yet out of these, the whole of the immense variety of vegetable products is constructed.

This being the case, we need hardly say that the methods of plant chemistry are of supreme interest, both to the chemist and to the vegetable physiologist. By the aid of what forces, through what course of reactions, are the simple materials moulded to their final issue? The higher plants are in some respects unfavourable subjects for the study of plant chemistry; their different parts have different functions, and the changes in progress are obscured to the student by the fact that changes of a very different type are in progress at the same time, and in places very near to each other. What would not the physiologist give if he could isolate a single cell, and grow it by itself in solutions of known composition, when by studying the nature of the cell's new growth, and the variations taking place in the nourishing solutions, he might hope to be able to grasp the facts of cell nutrition, and the nature of its waste products? Such an opportunity is actually afforded when we study the chemical changes brought about by bacteria.

In bacteria we have the vegetable cell in its

* Paper read by R. Warington, F.R.S., at the Nottingham meeting of the British Association.

simplest form; we have a mass of protoplasm and a cell wall, but the cell is single, or united with a few others; and as far as we know the life changes in all the cells of every species living under the same conditions are the same. Moreover, these organisms grow freely in suitable solutions, and the chemical changes produced in the materials held in these solutions can be readily ascertained. We have thus in a study of the chemistry of bacteria a splendid opportunity for enlarging our knowledge of plant chemistry, and indeed of becoming acquainted with the fundamental reactions on which synthetical organic chemistry depends.

The study of the chemical work performed by bacteria has occupied as yet but a few years, but the results have been most remarkable. The immensely numerous species of bacteria have been found to exhibit an almost equally great diversity of action. Different members of the class have been found to flourish under entirely opposite conditions, to feed on wholly different materials, to perform an immense variety of chemical work upon the media in which they live, and yet the chief product of plant-life—the formation of protoplasm and cell-wall—is probably in each case practically the same. The study of the chemistry of bacteria has thus greatly enlarged our conception of the chemical power of the vegetable-cell.

As a contribution to the discussion to-day, I propose to call attention to the chemical actions displayed by three species of bacteria existing in the soil, and all of first-class importance in their relations to agriculture.

It is well known that all ordinary soils contain organisms possessing a vigorous power of oxidising, of bringing about a combination between the oxygen of the air and various organic and inorganic bodies. Thus, dead vegetable and animal tissues in soil are, under favourable conditions of heat and moisture, resolved into carbonic acid, water, and nitric acid.

Particular experiments show that the nitrogen of albumin, gelatin, asparagin, urea, ammonia, ethylamine, and thiocyanates, is converted by soil into nitric acid. Nor is the action confined to organic matter, for nitrites are oxidised to nitrates, iodides to hypiodites and iodates, and bromides to hypobromites and bromates.

The organisms producing nitric acid have been made the subject of study by many chemists, and after much labour and many disappointments they have been satisfactorily isolated. We now know that the production of nitrates in the soil—a process of the greatest importance for the nutrition of agricultural crops—is accomplished by the action of two organisms, each of which performs a distinct stage in the work. By one organism, ammonium carbonate is oxidised, and the nitrogen converted into a nitrite. By the second organism, nitrites are converted into nitrates. We have here an excellent example of the way in which certain special functions, certain narrowly-limited lines of work, are exercised by individual species of bacteria. The nitrous organism can oxidise ammonia to nitrite, but it cannot change a nitrite into a nitrate. The nitric organism, on the other hand, oxidises nitrites readily, but it cannot oxidise ammonia. Both organisms are present in all fertile soils, but the formation of nitrites is not usually perceived, as they are at once converted into nitrates.

The organisms we have mentioned grow and exercise their functions in dilute solutions of appropriate composition, and it is therefore possible to study exactly the mode of their nutrition. Like every other living organism, they grow and exercise their functions only when certain inorganic salts supplying phosphates, sulphates, potassium, calcium, and magnesium are present. The continued omission of one of these has been proved in several cases to bring about a cessation both of growth and function. The general fact is familiar to physiologists, but it

is singular that we have as yet no rational idea of the mode in which these various inorganic bodies assist in plant nutrition, with the exception of the fact that sulphur, and possibly in some cases phosphorus, are constituents of albuminoid bodies.

As to nitrogenous food, these organisms are amply furnished by the ammonia, the nitrite, or nitrate which is intentionally added to the solution; the addition of no other nitrogenous substance is necessary. Here, too, we are on familiar ground. Ammonia and nitrates are both well known as the most appropriate nitrogenous food for plants.

When we inquire, however, what is the source of carbon to the nitrifying organisms, we are confronted by a startling novelty. It is found to be quite unnecessary to supply these organisms with any carbonaceous food save carbonates, bicarbonates being preferred. The fact of the conversion of carbonates into organic cell substance has been conclusively proved in the case of the nitrous organism; it is at present assumed to be also true of the nitric organism, as this also requires the addition of no organic carbon to its nutritive solution.

The fact that green plants exposed to sunlight are capable of forming organic substances from the carbonic acid and water of the atmosphere is well known to physiologists, but it is equally certain that this action does not occur in the dark. Yet here we have a colourless cell, destitute of chlorophyll, growing in the dark, which nevertheless is capable of decomposing carbonic acid, and producing from it carbonaceous cell-substance. From a purely chemical point of view this reaction may well appear at first sight incredible, as the decomposition of carbonic acid is an action requiring the consumption of much energy, which in the case of the green plant is supplied by the sun's rays, but in the case of the nitrifying organism is supplied in no such way.

This theoretical difficulty disappears, however, when we look at the whole reaction brought about by the nitrous organism. This organism attacks carbonic acid in its combination as ammonium carbonate, and the formation of an organic carbon compound proceeds at the same time as the oxidation of the ammonia, the result of the whole reaction being the liberation of heat, and not its consumption; a supply of external energy is thus not required.

Expressed in its simplest terms, the green plant manufactures carbohydrates from carbonic acid and water by a consumption of solar energy, as follows:—

The nitrous bacterium oxidises ammonium carbonate, producing at the same time ammonium nitrite and a carbohydrate; this reaction we may express in its simplest form as follows:—

The equation, however, by no means fully expresses what actually occurs, as Winogradsky finds that thirty-five parts of nitrogen as ammonia are oxidised for one part of carbon assimilated; the whole reaction is thus strongly exothermic.

The nitric organism multiplies more slowly than the nitrous, and does not afford a good subject for quantitative experiments; its nutrition has not yet been fully studied.

The last organism I wish to speak of is the one of which Winogradsky has given a preliminary description during the present summer. It has been obtained from soil, and possesses the remarkable power of assimilating the free nitrogen of the atmosphere. To accomplish this assimilation it is simply necessary to grow it in a solution containing sugar (dextrose), and the necessary salts, no combined nitrogen being supplied. Under these circumstances a vigorous growth of the bacillus takes place, the sugar undergoes a butyric fermentation, and at the end of the operation it is found that the culture has acquired nitrogen, the amount being apparently about $\frac{1}{100}$ th of the weight of the sugar fermented. By using as much as 7 grams of sugar, an assimilation of 14 milligrams of nitrogen has been obtained. Washed air, free from ammonia and nitrates, was used in these experiments.

That a vegetable organism should be able to

acquire from the air the whole of the nitrogen which it needs is certainly very remarkable, and is an extraordinary fact, both to the physiologist and chemist. We have no clue as yet as to the mode in which the nitrogen enters into combination, but it is evident that in this case, as in the nutrition of the nitrous organism, the difficult piece of chemical work forms but a small part of a much larger reaction that is at the same time in progress, and with which it is essentially connected.

It seems not improbable that these results of Winogradsky will explain some facts which have hitherto presented much difficulty. That a special organism, when in union with the roots of a leguminous plant, is capable of bringing about the assimilation of the free nitrogen of the air, is now admitted by all; but it is denied by Schlessing, and other accurate observers, that the same organism when living in the soil has any such property. May we not suppose that for the assimilation of nitrogen to occur the organism must be supplied with sugar, or its equivalent; and that this supply of sugar to the organism only takes place when the organism gains access to the sap of one of the higher plants?

In conclusion, I think we shall all agree that however imperfect is our knowledge of the chemistry of the three species of bacteria we have considered, the facts which have been established have, at least, enlarged our conception of the capabilities of a vegetable cell, and I trust that some light has also been thrown on the general method by which some of the extraordinary chemical results are attained.

ON SOME SPECIES OF PLANTS AT HONG-KONG.

HABENARIA MIRSISANA, Champion.—Although by no means so showy as *Habenaria Susanna*, Br., it is certainly as pretty. The specimens which I found were growing at an altitude varying from 1400 to 1700 feet on the south slopes of hills amongst long grass. This species attains a height of 18 inches; the leaves are three or four in number, almost lanceolate, and about 4 inches long. The flowers are from three to ten on a spike, pure white, and an inch across. The lip is nearly three-quarters of an inch in width, and deeply three-lobed. The middle lobe is linear, the two lateral ovate, and beautifully fringed, the whole lip being merged into a spur fully $1\frac{1}{2}$ inch long. It flowers at the end of August or beginning of September, but it is not nearly so often met with as *H. Susanna*.

Muscivanda pubescens, Ait.—At the latter end of May this is undoubtedly the most noticeable plant in flower in the island, for it meets the eye at every turn. Sometimes you find it as a twiner, encircling itself around some large shrub or tree; at other times it forms a bush 3 or 4 feet high and 5 or 6 feet through; in either case it is exceedingly pretty. It owes its beauty principally to the peculiar form and colour of some of its sepals. In each corymb three or four of the outer flowers have one of their five sepals produced into a white leaf-like appendage, often 2 inches long and $1\frac{1}{2}$ inch wide. The tube of the corolla is white, 1 inch long, the lobes being canary yellow on the upper side, and not more than one-sixth of an inch long. The leaves are dark green, ovate, and about 3 inches long. I have seen plants of it in England, but they could not be compared with the specimens met with here in a wild state.

Camellia reticulata, Lindl.—The Natural order Ternstroemiaceae is represented in Hong-kong by eight genera, of which *Camellia* contains the largest number of species, namely four. The present species grows into a small tree 20 to 30 feet high. Out of flower it is an imposing-looking plant, with its dark green glossy foliage. The individual leaves are oblong, 6 inches long, and from 2 to 3 inches wide. In flower, however, it is far more imposing, with its large white blossoms, which are produced in the axils of the upper leaves, and are often more than 3 inches across. It is found growing in woods, and is at its best in June. When I was at Kew, there was a fine specimen of it in the temperate-house

there, and during the flowering season it was a sight really worth seeing. It had, however, pink flowers.

Schima Noronhae, Reinw.—This makes a small tree of great beauty, sometimes attaining a height of 30 to 40 feet, and as many feet through. The flowers are white, nearly $\frac{1}{2}$ inches across, and are very freely formed toward the ends of the shoots. The leaves are oblong, 3 to 4 inches in length, and coriaceous. It is in flower a little earlier than *Camellia reticulata*, and it inhabits similar situations to that plant, of which family it forms a member.

Lilium longiflorum, Thunberg.—This well-known Lily needs no description. It is common here on the hill-sides, and attains a height of nearly 3 feet, and bears from one to three terminal flowers varying from 4 to 8 inches in length. Under cultivation it is considerably improved. This year I noticed one plant with twenty-five flowers on it, and many more had from fourteen to twenty flowers. These results were from bulbs planted in beds in September of last year. Of plants grown in pots, five bulbs to a 10-inch pot, one produced thirteen flowers, the average number of flowers to a plant being eight or nine. In the gardens the flowers open towards the end of April, but on the hill-sides it is the end of June before they appear.

Rhodomyrtus tomentosa, DeCandolle.—Amongst the many showy hard-wooded shrubs which are found in Hongkong this one certainly deserves notice. It generally grows to a height of 4 or 5 feet, but is sometimes met with much taller. The leaves are pale green on the upper surface and hoary on the underside, oval, and about 3 inches long. The flowers are produced in the axils of the upper leaves, the peduncles being 1 inch long, bearing one or three flowers; each flower measures nearly 2 inches across. The petals are five in number, the colour of them varying from almost pure white to deep rose. It is a very common plant, and is often found growing in shady places, although generally it prefers the sun. It flowers during May. *W. J. Tutcher.*

ORCHID NOTES AND GLEANINGS.

DENDROBIUM PHALÆNOPSIS ROTHSCHILDIANUM.

This beautiful white form of *D. Phalænopsis* is again in flower in the Right Hon. Lord Rothschild's collection, where also many superbly grown and finely-flowered specimens of the other forms of Sander's importation of the species are making a fine show, one form with uniformly tinted rosy-crimson flowers being specially attractive. Of the last importation the largest bulbed pieces were selected, and in many cases the new growths are already larger than those imported. There is also to be observed a very fine show of other species, and especially the autumn-flowering *Cattleya labiata*, some noble forms of *Lælia pumila præstans*, *Lælio-Cattleya exoniensis* ×, the charming *Phalænopsis Lowii*, &c. In the *Lælia*-house are numbers of strong spikes on the white and coloured forms of *L. anceps*, which will in due time make a grand display.

CYMBIDIUM GRANDIFLORUM VAR. PUNCTATUM

A native of the eastern Himalaya, at elevations of from 5000 to 7500 feet. It has narrow lanceolate prominently ribbed leaves and large transversely oval flowers, with oblong acute olive-green segments and broad obtuse lip spotted with red. *Lindenia*, t. 389.

ODONTOLOSSUM TRIOMPHE DE RAMBOUILLET.

A natural hybrid allied to *O. crispum*, and resembles the form known as *O. Ruckerianum* ×. The segments are lanceolate, thickly spotted with carmine, lip oblong white with a yellow disc striped with carmine at the base. *Lindenia*, t. 390.

GALEANDRA CLAESII, COGNIAUX, SP. NOV.

A Brazilian species described by M. Cogniaux. The pseudobulbs are slender elongated leaves,

sheathing-sheaths spotted, blades lanceolate acuminate, flowers numerous in loose branching panicles, peduncles very slender, flowers transversely oval, segments spreading oblong, brownish, lip involute, fore lobe flat, white striped with purple. *Lindenia*, t. 391.

CYMBIDIUM LOWIANUM, Rehb. f., VAR. SUPERBISSIMA, Linden.

Distinguished from the type in the deeper colour of the blotch on the front part of the lip. Native of Burma. It requires a medium temperature and a light well-ventilated position, with abundance of water in the growing season. *Lindenia*, t. 392.

FLORISTS' FLOWERS.

GLADIOLUS SOPHIE BUCHNER.

A HARDY form of the Lemoine race, with cream-coloured hooded flowers, the three lower segments having a broad rosy-lilac blotch. A good specimen was lately sent us by Messrs. Wallace of Colchester.

PROSPECTS OF THE CHRYSANTHEMUM SEASON.

Those persons who are in the habit of attending any of the numerous exhibitions of this autumn flower will form some speculations on the prospects of the coming season. Many persons, I understand, fear that the abnormal heat experienced during the summer may have detrimentally acted on the plants, and that the blooms in consequence will be poor in quality; and opinions have also been freely expressed as to the earliness or otherwise of the blooms. My opinion is, that we shall see the majority of blooms of excellent quality if not very large; this will be no disadvantage, as the huge blooms often seen are sometimes coarse, and their production should not be encouraged. Those of a middle size according to the variety, and possessing depth of petal, solidity of bloom, and richness of colour, are to be the most encouraged; and these we are likely to see this season, if one may judge from the appearance of the plants and the manner in which the blooms are developing at the present time. I do not suppose that the season will be nearly as early as many fear it will be; indeed, some collections of plants appear to be the reverse of early, owing to the manner in which the plants made their first and second natural breaks. In this case cultivators feared the second bud would be too early to be retained, and they let the plants grow on for the formation of the terminal buds. In consequence, many late blooms will be witnessed. This is also no disadvantage, as by it the flowering season will be considerably prolonged. These late blooms may not possess the size of the earlier ones, but they will have a depth of colour not possessed by those. Seasons like the past entail an enormous amount of labour on cultivators; but where this can be afforded and met fully, experience has shown that the results are generally good. Plants during the hottest part of the season require to be watered three times a day, and if they received it but twice instead, failure in some way is almost sure to ensue. It is some such errors in practice which give rise to the bewailing of careless cultivators, that the flowering of Chrysanthemums will not be good. In spite of the past summer-heat, we are sure to see some varieties of Japanese shown along with the more common ones, which, in ordinary seasons, are considered to be too early for the big exhibitions; as, for instance, that pleasing variety from America, William Tricker, rose-pink in colour, will be shown as the result of what some growers call an adverse season. Such weather tends to test the abilities of the cultivator to the utmost, and those persons who have succeeded will have no reason to complain of their endeavours.

The season promises to be rich in Japanese novelties, many of which possess much merit. A great improvement is manifest in the habit of growth, as a few years since it appeared necessary for the plants to run up to 10 feet high before they gave us high-class blooms. Now we obtain them from plants under 3 feet—a decided gain, brought about by cross-

breeding. Varieties of the former class could not be well employed as objects of decoration owing to their ungainly growth, but now these large-flowered Japs. are suitable for almost any kind of decoration.

I never remember the small-flowered kinds—as Pompons, Anemone Pompons, single varieties, and those of the larger section, which as bushes produce, as a rule, a quantity of bloom rather than a small number of fine blooms—looking so well. These plants are not ungainly tall, and they appear to be very floriferous, the wood especially short-jointed, and nearing maturity. The cultivation of Chrysanthemums in the open air has extended very considerably of late, the varieties planted being better chosen than formerly. It is useless to attempt to grow in ordinary seasons the incurred varieties. [The late Mr. Salter did not think so. Ed.] Those of the Madame Desgranges type are preferable in most points. They afford more bloom, are dwarf, and as a consequence, do not require so much attention in matter of staking. Many bare walls may be made gay during the month of November, and in favourable seasons well into December, if a proper selection is made. Pompons, the small-flowered varieties of Japanese with reflexing florets, as well as the single-flowered varieties, are well adapted for out-of-door culture. In our gardens, these out-of-door plants promise remarkably well, having made many side-shoots, which will add greatly to the number of the flowers.

With some temporary protection in the event of frost coming on, a well-clothed wall of Chrysanthemums is an object of no mean beauty in a garden. *E. Molyneux.*

ROSES AND CARNATIONS.

We have daily cut blooms of Roses and Carnations out-of-doors up to the middle of this month, and the Tea Roses and some of the Carnations would continue to give us flowers till Christmas if the weather were fine and mild. We can obtain the right temperature, i.e., 50° to 55°, and other conditions required for affording bloom in a well-ventilated roof-heated span-roofed house. The point is to have ventilation more or less all day, and also at night when the air is clear; Roses like air above all things, and it is just as necessary for the well-being of Carnations. As I write, I am looking out over a collection of Carnations with scarlet, white, pink, and crimson blooms. These are in a house where the top and side-windows have been wide open day and night, and as yet no artificial heat has been used. One important point seems to be the protection of the flowers from rain. The flowers of Carnations are at this season always welcome. Of course, those who would have a beautiful display either of Roses or Carnations at this season of the year must make preparation in good time. The Roses should be grown in pots during the summer, and pruned early in the month of August, so that some growth may be made during the usually fine weather of that month; and here, again, Tea-scented Roses are the best, almost every new growth being furnished with flowers. The worst evil that the Rose in the autumn has to contend with is mildew, which spoils the foliage and the flowers. The best specific to use against mildew is flowers-of-sulphur, which should be dusted over them; but if the attack is severe, it is better to use it in a liquid state, which can be done by mixing 2 oz. of soft-soap and 4 oz. of flowers-of-sulphur in 1 gallon of water; let the plants be laid on their sides, and thoroughly syringe the leaves. This procedure will not only destroy the mildew, but green-fly. Red-spider, which may be upon the plants, may be washed off or driven away by diligent syringing with clean water. When Tea Roses are intended to bloom principally in the months of October and November, a special kind of treatment is required, that is, they should be repotted early, and well established in their flower-pots by the end of the summer; and the best kind of potting-soil for Tea Roses consists of three-fourth pasture-loam, one of peat, one of rotten horse-dung, and a fair proportion of coarse sand, with a pint of bone-dust to a bushel of the soil. These Roses for late autumn-flowering are best under glass after the repotting,

else some means must be taken to protect them from heavy rains. Before pruning the plants in the summer, and previous to starting them into growth, they should be kept well on the dry side for a period of six weeks or two months, and be dried when pruned. After the pruning is carried out, let them remain dry for a few days longer, till the wounds made with the knife have dried up, when they may be afforded water sufficient in quantity to moisten the whole ball, and when they have well started into growth they should not lack water, or mildew will attack them.

The Carnations may be grown with the Roses out-of-doors, if no glass-house is available, Carnations, both winter-flowering and others, doing best

COLONIAL NOTES.

JOHANNESBURG.

AFTER nearly six months of severe drought, with fearful dust storms, the summer rains have come to us, to the great relief of everyone. Of frost we have had very little the past winter. In dry sheltered gardens *Bougainvilleas* and Indian *Azaleas* are untouched, but in low damp places and on open hill-sides, many young *Eucalypti* and *Casuarinas* have lost their tops—a trifle this, as they now begin to grow again.

The rapid growth of Johannesburg is wonderful, as must needs be the chief town of a district which produces five tons of gold a month. Readers of the

Of the lawns in gardens here I have spoken before. The grass used is our native *Cynodon Dactylon*, or Bermuda-grass, which answers its purpose very well. All through the winter trees of *Acacia dealbata* and *A. saligna* have borne a wealth of golden bloom, untouched by wind or frost. Already the first spring flowers are appearing in the green veld. Masses of blue *Lobelia*, white patches of *Helichrysum cespitosum*, a purple *Scilla*, a white *Gazania*, pink and yellow *Nemesia*, and a pretty rosy *Gerbera*. Tree planting is going ahead with greater speed than ever, as well it may, with firewood costing 5s. per cwt. Recently I was informed that six-year-old Blue Gums were sold at 20s. each for scaffold-poles. The trees most favoured by planters are *Eucalyptus globulus*, *E. amygdalina* and *E. robusta*, *Pinus insignis*, and *Acacia mollissima*. R. W. Adlam, Joubert Park, Johannesburg, September 24.

SINGAPORE.

Habenaria carnea is one of the most interesting Orchids found in this region. There is considerable variation in the colour of both flowers and leaves. The former, which last in perfection from six to seven weeks, vary from deep salmon to ivory-white; and the latter from light green to dark brown, and dark brown speckled with white. It is of easy cultivation, requiring the same treatment as *Calanthes* of the *vestita* section, with which it is found associated. After flowering, the foliage commences to die off, and water should be gradually reduced until it is quite dry, after which no more should be given for two or three months, or until the plant shows signs of recommencing growth. This plant was first discovered by myself about four years ago, during a trip to Pulau Langkani, a group of limestone islands sixty to eighty miles north of Penang. A subsequent trip added very few plants to our collection; and as several local collectors who have seen the plant in flower in the Penang Gardens have since gone in quest of it with no better success, it may safely be assumed that it is a comparatively rare plant. C. Curtis, Singapore.

CATTLEYA × CHLORIS.

(*BOWRINGIANA* ♀, *MAXIMA* ♂.)

OUR illustration (fig. 88) represents one of the fine hybrid *Cattleyas* raised and recently flowered by Messrs. Jas. Veitch & Son, Chelsea, who exhibited it at the meeting of the Royal Horticultural Society on October 10, when it was awarded a First-class Certificate by the Orchid Committee, and duly noted by us at the time. The plant is excellent in all respects; it has the free growth and numerous flowers of *C. Bowringiana*, and also its brilliant rosy-purple hue; while the flowers are so large as to rival the *C. labiata* section in showiness. The labellum is of brilliant violet-purple colour, veined with lines of a still deeper tint, the base being ochre-yellow, veined with dark reddish-purple.

ROYAL BOTANIC GARDENS, GLASNEVIN.

We condense the following particulars from the Annual Report:—

"There is nothing calling for special reference in connection with the Botanic Gardens on this occasion. They have, as usual, been kept in excellent order. It is hoped that, during the coming year, sanction will be given for the erection of the house for succulent plants, which has so often been applied for. The necessity for it has been frequently shown by the injury to valuable plants caused by the unsuitableness of their surroundings.

"*Conservatories*.—The conservatories are in good order. Any small repairs which were necessary were promptly carried out by the Board of Works.

"*Orchid-house*.—In my last report I alluded to some alterations which I pointed out as desirable in the Orchid-house. In August these changes were effected, and the beneficial effect on the plants is already observable. The old solid brick staging was removed, and replaced by a substantial open iron and slate staging, rising in tiers. Underneath this a

FIG. 88.—CATTLEYA × CHLORIS.

out-of-doors during the summer and autumn months, and they then flower very freely. The young plants produce the best flowers, and when the cuttings have been put in during the months of January or February, the plants grow to a good size by the autumn, flowering from September to the new year. My collection consists of very few varieties, and these are dwarf and free-flowering; they consist of *Middle Carle*, white; *Mrs. Moore*, large pure white; *Mrs. Llewelyn*, bright rose; *Purity*, white—a robust-growing variety; *Winter Cheer*, the best bright scarlet; and *Miss Joliffe*, pale pink. The same kind of potting-soil will do for Carnations and Roses alike; and generally the plants are grown strong enough to bear flowers in 6-inch pots. Carnations may be grown on to flower a second year, but a great deal of space is required to do them justice, and certainly they do not produce flowers as fine as in the first year. J. Douglas.

Gardeners' Chronicle may doubt this statement, but it is a fact. I have stood on a hill just outside town, and looked down on the great city—like the lady in *Pickwick* "swelling visibly"—directly below a mass of iron-roofed villas, shops, and streets interspersed with masses of blue-black *Eucalypti*; beyond is the great Main Reef, 30 miles long, with countless smoking iron-stacks, roaring quartz batteries, and towering hauling gear, and beyond the bare undulating open veld widening out in the distance, one mountain ridge rising beyond the other to the sky.

But Johannesburg is very much more than a mining camp built of iron shanties and wooden-huts. Miles of charming villas, each with its tastefully designed and well-planted garden (irrigated with water costing 10s. per thousand gallons), shows that even if we do live on the bleak high veld in a Boer Republic, we are determined to make our lives as comfortable as possible.

space was reserved to hold leaf-mould and fermenting materials. The flow and return hot-water pipes were altered and raised, so as to secure a free circulation of hot water, and an equable diffusion of hot air throughout the house. This hot air has now free access to all the plants in the centre of the house, which was not the case before, and I trust that in consequence the plants in future will be free from disease brought on by cold damp air during the dull months of the year. The general appearance of the house has also benefited from the alterations. The compartment of the Orchid-house in which Ferns are grown was not altered. The Orchids were removed to the propagating pits while the alterations were in progress; and as they were carefully tended, they did not suffer in the least.

"Outdoor Department.—The chief work carried on in the grounds during 1892 was the construction of a new rockwork for Ferns. This new rockwork has been constructed beside the existing fernery, and adjoining the rockwork which was made some years ago. It consists of two banks of stone, with a path between them, sloping down towards the pond, and forms a useful and pleasing addition to the garden.

"The botanical arrangements have been carefully looked to, and every endeavour has been made to keep them as perfect as possible, to make them thoroughly representative, and to have all plants clearly and accurately labelled. The amount of labour involved in this may be gathered from the fact that over 2500 labels were printed and put to plants in the grounds during 1892.

"Arboretum.—In pursuance of the changes rendered necessary by the addition of the new arboretum, the trees in the former Elm class were taken down. The ground where they grew was thoroughly broken up, manured, and cropped, but it will require to be again cropped before it can be relaid with grass. The young plants belonging to the Pyrus group, which are being prepared in the nursery ground, will then be planted in it. The class for Elms is now in the new arboretum. The collections of trees and shrubs have been added to, and duplicates have been further removed.

Number of plants purchased, 1892.

Orchids, Ferns, Palms, and indoor plants	... £198	1	11
Hardy plants, trees, and shrubs	32	15
Seeds, bulbs for pots and beds, &c.	29	10
Total	260	8

In 1891, 898 plants were purchased, the following amounts being expended:—

Orchids, Palms, Ferns, and indoor plants	... £204	16	4
Hardy plants, trees, and shrubs	36	17
Seeds, bulbs for pots and beds, &c.	34	1
Total	275	15

"The number of donations received was 104, the number of donors 78, residing in the following countries:—Ireland 24, England 22, Germany 7, France 4, Australia 4, Italy 3, India 3, Austria 3, Jamaica 2, Scotland 1, Guernsey 1, Switzerland 1, Holland 1, and America 1.

Donations to Garden.

Plants	846
Seeds	1361 packets.

Donations from Garden.

Plants	1073
Seeds	2973 packets.

"General.—The laboratory has been much used by Professor Johnson's pupils, and courses of special instruction in systematic botany have been conducted in it during the greater part of the year. It is a valuable acquisition to the garden, and I trust that its existence may lead to independent work and research by some of the pupils.

"I greatly regret that the two items mentioned in my last report as being so much required have again been struck out of the estimates. They are (1) a house for succulent plants, (2) a house for tropical Ferns.

"The necessity for the house for succulent plants has been recognised and urged by the Science and Art Department, by the Board of Visitors, and by the Board of Works, but other items have hitherto

been placed before it, although not so urgently pressed for. It only remains for me again to call attention to the matter, and to urge that it may be given precedence of all other items."

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickingree Lodge, Timperley.

CURRENT WORK.—The most of the species of Dendrobiums will have completed their growth for the season, and been removed to a much cooler and drier house for resting. Our plants are placed in a lean-to house, which was used at one time as a late vinery, and facing south it gets plenty of light, and the temperature can be regulated to suit the plants by using artificial heat, or dispensing with it just as may be necessary. Plenty of air can be admitted by means of the lights at top and bottom. On *D. nobile*, *D. Wardianum*, and *D. crassinode*, the flower-buds are swelling, and the same stage has been reached by *D. Ainsworthii*, *D. Leechianum*, and *D. splendissima*. It is my opinion that these two varietal names should be abandoned, and we should henceforth know them as *D. Ainsworthii* varieties, especially as in increasing them the varieties have got mixed up as regards their names, and it is now difficult to say which is which. *Dendrobium Dominionum* is another good cross-bred Orchid, but there are numbers of the variety in commerce which have very pale-coloured flowers, and are hardly worth growing. Another grand cross-bred is *D. Cassiope*, a variety that is nearly always in flower, and seems to require scarcely any rest. We have plants of it which have flowered for the third time this year, and are now making new growths. *D. Venus* seems a shy bloomer as yet, and takes more after one of its parents, *D. Falconeri*, and it is a difficult plant to put to rest, as before one pseudobulb is half-finished, another new one will start. The best method of treating it is to keep it much dryer at the roots than other Dendrobies. It is a grand thing if this difficulty about resting it can be overcome, and it can be induced to flower; but I hear complaints of its reluctance to flower from many growers about my neighbourhood. A few of the earliest of the *D. nobile*, *D. Wardianum*, and *D. crassinode*, if these are required about the end of December, should be placed in a house with a few degrees more warmth for a few weeks, and afterwards placed in the stove. *D. Dalhousieianum*, *D. clavatum*, *D. moschatum*, *D. fimbriatum*, and *D. f. oculatum*, will have their growth so far made up that it will be safe to remove them to a cool house for a few months. The house which the plants have occupied hitherto should be cleaned with hot soap-suds, afterwards syringing all surfaces with the hose or garden-engine. The Derbyshire spar, coke, shell-gravel, or other material, with which the stages are covered, should also be washed in hot suds. When this house is cleaned, it will afford a place for the flowering of *Calanthes* and other plants, besides Orchids requiring warmth. Now that plants of *Cattleya labiata vera* are in bud and flower, more water may be applied to them until the bloom is over. A good watering at the time the buds push out of the sheaths gives the flowers much more substance, and they seem to last longer than when the plants are kept dry at the root, although after flowering those that are not showing bud may be kept quite dry for a time.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

VINERIES.—Where Grapes are grown largely and well, there is now much work in cleansing mid-season vineries and Vines, and in renewing borders, &c., as previously advised. We prefer giving the necessary attention to outside borders towards the time of starting, afterwards thatching or covering the surface with shutters or tiles. Those borders in damp low-lying situations should not be covered with thick coatings of close manure, but dry leaves and litter should be placed as protection from excessive damp instead, and when the weather will permit of this being removed, a dressing of Vine-manure may be given. When late Grapes are to hang till late in December, and then afterwards to be kept till spring in bottles, the borders should be kept dry. Search assiduously for decaying berries bi-weekly or oftener, and use the scissors very carefully while removing them. Use a little fire-heat to expel damp, and while the foliage remains the thermometer should not fall below 50°,

except during severe weather, when 45° may be the minimum. Keep the front lights closed when the weather is foggy, but top air should be judiciously given to allow moisture to escape.

POT VINES.—Where the earliest Grapes are obtained from pot Vines, and the necessary bottom-heat is supplied by means of fermenting materials, some leaves mixed with a fourth part of stable litter should be in readiness by the end of the month. Tan answers well, and should be used rather dry. The Vines should now be under cover, the drainage put right, and the surfaces of the pots dressed, as previously recommended. If any insects have been seen on the rods, a good washing with Gishurst Compound soap, at the rate of 4 oz. to the gallon, should be given, and the house or pit where they are to be started thoroughly cleaned, and no plants which mealy-bug or scale are likely to infest should be in the same structure with the Vines. New borders for Vines are often formed during the autumn, but we prefer only to get the loam put in order at this season, and keep it dry in a ridge.

PEACHES AND NECTARINES.—There is much difficulty in keeping early Peach and Nectarine trees late enough this season. The lights should now be off night and day, where such can be removed, and where there are no portable sashes, front and top ventilators should be wide open. Prune, wash, and otherwise prepare for mid-season crops, and rest the trees as thoroughly as practicable until they are started, bearing in mind that this is conducive to the retention of buds and setting of the fruits.

ORCHARD-HOUSES.—It is seldom these useful structures can be forced profitably, and the use of hot-water pipes, to exclude frost only when bud expansion and growth have begun, and to assist in ripening wood and fruit when necessary, should be used. The trees, whether in pots, tubs, or planted out in beds, should be kept as cool and dry as practicable. Frost should be kept from the roots by means of litter or bracken, but they must not suffer from drought. Any trees planted out that have made gross unfruitful wood may be lifted and replanted, using good fresh loam about the roots.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

TIDINESS IN THE GARDEN.—We have now arrived at a season when tree leaves accumulate fast, as well as other garden refuse, and still the garden should present a tidy appearance. If a fire be made in some out-of-the-way place, where all decaying vegetable matter may be taken and burnt, it will be got rid of with little trouble, and the ashes will be found serviceable for encouraging the growth of crops. The tree leaves should be raked up, and kept dry if possible, as materials for making up hot-beds, either alone or by mixing them with stable-litter. Manure may now be wheeled on to all vacant plots, which should then be dug as deeply as the soil will allow without turning up the sterile sub-soil. Plans may now be made for next season's system of cropping, so that the ground may receive that kind of treatment which the various crops demand; and at this season, as other work allows, all digging and trenching should be completed as far as possible. Let there be plenty of protecting material got in readiness against frost; last year all were caught napping in November, and the frost spoiled many things which, had we the materials at hand, might have been saved. If new walks are contemplated, now is the time to make them, as the materials will get settled down before the spring. Look well to all drains and catch-pits, for if these be not kept open, the water cannot run off the walks.

GLOBE ARTICHOKEs.—It is well to protect the roots of these early in the season, and for this purpose any rough litter will answer, but if fresh leaves be put round the roots, close up to the stems, these being dry, will exclude frost better than anything else. The hearts of the plants must, however, be left uncovered till severe frost comes, for if these are covered up early decay ensues. Flower-stalks and outside leaves should be removed previous to covering up, so that the live heart-leaves may go closer together.

CELERY.—All but the latest lots should now have their final earthing-up. In doing this, the ridges should be brought to a sharp edge at the top, and the sides made smooth, so as to throw off rain. In moulding-up for this last time, press the soil round the leaf-stalks, and do not let any get into the heart. When earthing is finished, the ground between the ridges should be loosened, a practice that will bring a greater depth of soil into use in the

future; and if some manure be dug into it, the soil will be in much better heart for an Onion or other crop next season.

FORCED VEGETABLES.—These will soon be in request, and it must be borne in mind that at this season the forcing cannot be hurried, or bad results will most certainly follow. A slight hot-bed should now be made which will keep a bottom-heat of 75° to 80° for some weeks, and on this Carrot-seed may be sown, but great vigilance must be exercised where tree-leaves are used in its preparation, as the snails and slugs collected with these will soon devour the tender seedlings. Make a sowing of French Beans, and pay great attention to earlier sowings in flower, remembering that a too-close atmosphere will hinder the setting of the flowers; and on every mild sunny day the ventilators should be opened, due regard being had to the strength of the plants, sudden changes in temperature while they are tender causing a check to growth. Do not overcrowd or let the plants lack water, and gather the pods as fast as they become large enough for table.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

THE PRUNING OF WALL PEAR TREES.—With fruit all gathered in, no opportunity should be missed of pruning and afterwards cleaning fruit trees on walls, especially as the weather is now favourable for this kind of work. If the Pear trees are aged, and the fruit spurs of great length, also numerous, the pruning should begin always as early as possible. In dealing with trees of this kind, the longest spurs should be sawn off to within 2 inches of the base, except on that very fine variety of Pear, Doyenné du Comice, which, bearing as it does chiefly wood of two or three years old, should have all the spurs sawn off for 2 feet on each side of the main stem, the wounds being in all cases rendered smooth with the knife. The healthier a tree so operated upon, the better will it break after pruning. But pruning at this season is more favourable to a good break generally, than pruning performed at a far later date; especially will this be the case in a year like the present, when sun-heat still remains in the ground. Any other pruning of Pears will consist in shortening the foreright shoots and the leading shoots, according to the space which is to be covered. The above remarks refer to established trees with branches trained horizontally, or like the ribs of a fan. Younger trees which may have made strong growth should have the leading shoots cut back to 2 feet, this being long enough to ensure a good break along the whole length of shoot. Cordons will require similar pruning, thinning out the longer fruit-spurs, but leaving enough of them to secure a crop. It being, as a rule, necessary to have long spurs on cordons, thinning out and shortening back are operations that have annually to be carried out more or less.

PEAR TREES INFESTED WITH SCALE.—Trees infested with the scale insect are not easily cleared owing to the tenacity with which the insects sit on the bark, and their small size. First loosen the trees from the walls, and with Fir-tree oil, at twice the strength recommended for aphid, and a stiff painter's brush, scrub every portion of the tree, being particular to get at the back of the branches. Gas-water one-third, and clear water two-thirds, applied in the same manner, is a very effectual remedy, as it leaves the bark very unpalatable to the scale; and if any should escape they do not thrive—and thus by repeating the dressing in the winter following, it is possible to quite rid the trees of scale. Apart from the injury caused to the trees by the Pear-tree scale, it also gets on to the fruit, and is not easily removed.

THE FLOWER GARDEN.

By T. H. CRASP.

THE FLOWER BEDS.—The clearing of the beds of their summer occupants must now proceed with expedition, or sharp frosts may interrupt or put a stop for a long time to such work. If the transplanting of hardy plants used in spring bedding be not completed in the present month, they cannot be expected to flower well next spring. Where entire beds are planted with Wallflowers, the soil should be trodden till it is quite firm, and again trodden after planting. This will ensure slow and starchy growth, enabling the plants to withstand hard frost successfully. As soon as the foliage of Dahlias is slightly blackened by frost, cut off the stems of the plants at 6 inches above the soil, and dig round and lift the tubers without wrenching or bruising them, and put them in a cool airy shed or a

greenhouse, stalk downwards, for a week, storing them afterwards in some frost-proof place; if they can be packed in dry earth or sand, the tubers will not lose so much of their juices as when stored without anything about them. The roots of Marvel of Peru should also be lifted, and treated in a similar manner. The final batch of cuttings of Calceolarias, Gaillardias, Violas, Pansies, Phloxes, and evergreen shrubs of all kinds, should be put into cold frames, employing sandy soil and leaf-mould, 6 inches in depth, which make level and firm, and dibble in the cuttings at 2 or 3 inches apart, then water the whole thoroughly, and keep the frames close and shaded on sunny days for a few weeks.

CALOCHORTUS OR MARIPOSA LILIES.—These splendid Californian bulbs are beautiful when in bloom, which is towards the end of the summer. The present time is the most suitable for planting the bulbs; and a warm border, facing due south, if possible, is the best place for them. The soil should be of a sandy nature, and the bulbs planted about 3 inches deep, using a little sand about each. The bulbs must have some slight protection during severe frost. The following are a few good varieties with distinct colours:—*C. venustus*, *C. v. oculatus*, *C. v. citrinus*, *C. v. roseus*, *C. albus*, *C. splendens*, *C. pulchellus*, and *C. Nuttalli*. The roots of *Anemone appennina*, *A. nemorosa*, *A. vernalis*, and *A. palmata* may now be planted, providing they are in a plump condition; but when they have been bought in and have been kept in paper-bags for some time, they are somewhat shrivelled, and if they are planted in that state, a good many of them would probably decay. In that case the safest plan is to start them in pans or boxes of moist sand, planting them out directly growth begins. They are very effective plants either in patches in the borders or in beds by themselves, and they succeed best if the beds are raised a few inches above the level, much moisture being very apt to prove fatal to some of the delicate varieties.

CLEMATIS of all kinds may be propagated at this season by layering, choosing firm young shoots for the purpose, and making an incision just below a joint, as is done with Carnations, and securing the shoot by means of a peg. The layered shoots may be detached from the parent plant about this time next year.

THE APIARY.

By EXPERT.

WAX SECRETION.—Amongst various experiments conducted by the Entomological Division of the United States Department of Agriculture in 1892, recently reported, was one to determine the quantity of honey that bees consume in secreting 1 lb. of wax. The result arrived at, 8 lb., is somewhat at variance with the generally-accepted theory, that to make every pound of wax, bees require to use 20 lb. of honey. Mr. Simmins tried a similar experiment a few years ago, and found 6½ lb. was the quantity consumed in his case, so that it may be taken for granted that from 6 to 8 lb. will be very near the mark. This low estimate will make it apparent that the bee-keeper does not gain so much as has been supposed in the use of foundation by the saving of honey. Probably he does not recoup in that way at all, so must be contented with the knowledge that he does gain by its use in obtaining more perfect combs, less drone-cells, and better sections.

ARTIFICIAL EVAPORATION OF HONEY.—Experiments are also reported by the Department in the artificial evaporation of honey. It has long been known that the excess of moisture in newly-gathered nectar has to be evaporated by the heat of the hive before it is sealed over by the bees, and can be called honey. As this takes some time to accomplish, it has been thought that if this nectar was extracted as soon as gathered, that the bees would have nothing to do but to continue to bring it in, and larger quantities of honey would be thereby obtained. The apparatus used for the purpose of evaporation caused the thin honey to flow over a surface artificially heated to 120°, and by the time it had run a distance, computed at 150 feet, subjected to this temperature, it was evaporated to the thickness of good honey. The colour, however, was found to be somewhat affected, as also the flavour. In another experiment sun-heat was tried for the purpose, and was found to be more satisfactory, as the flavour and colour were less affected. This method is within the reach of all bee-keepers, as no expensive apparatus is necessary. The honey was simply placed in a shallow pan, 3 inches deep, covered with a piece of glass, and stood out in the sun. In the space of four days about 5 per cent. of moisture

was evaporated, and in three weeks 30 to 40 per cent. of water which had been added to the honey for the purposes of the experiment had disappeared.

WHITE SUPER FOUNDATION.—Many complaints have been heard this season of bees refusing white or bleached foundation in sections, building comb on to the separators in preference, or refusing to go into sections altogether. This should be a warning to bee-keepers to in future ask for and use only super foundations of the natural colour, as the bleaching process renders the wax distasteful to the bees.

PLANTS UNDER GLASS.

By B. WANDS, Gardener, Birdsall Gardens, York.

FERNERY MANAGEMENT.—In the tropical or exotic fernery careful attention should now be given to the arrangement, to clearing the surface of the soil, ventilation, and watering. All the trailing plants, such as *Ficus repens*, *Aparagus prostratus*, &c., which are allowed during the summer months to ramble over the pillars and roof for the sake of shade and variety should be well thinned, to allow light to reach the Ferns. Specimen Ferns in pots should be afforded positions where they can be readily observed, and their wants attended to. Decorative plants in smaller pots should be turned round at short intervals of time to the light, so that they may be kept shapely. If woodlice or slugs exist in the fernery, place pieces of Carrot about for the latter, and kill the former at night with boiling water; for catching cockroaches put phosphorus-paste into small bottles, and lay these on their sides, so that the water cannot get into them—small bottles at 2d. each are the best, as they can quickly be gathered up. The American rat poison, "Rough on Rats," sprinkled about the haunts of cockroaches will thin their number. For thrips, syringe or dip in a solution of lemon oil at the strength recommended by the maker; it will not injure any of the fronds, however tender. Specimen Ferns in large pots will now need careful watering, and before affording water, try the weight of the plants sometimes, and if it is found that they are getting light, afford the soil a thorough soaking, putting ½ oz. of good plant-food into each gallon of water, which will have the effect of keeping the fronds of a good colour during the winter. Small plants in pots will require abundance of water, and basket Ferns will need good attention; and some fertilising moss mixed with sphagnum moss as a top-dressing is a useful aid. Ferns planted on walls, pillars, &c., will require heavy waterings with the hose or garden-engine about once a week during the shortest days, but such as are planted in rockwork where the root-run is not restricted, will not want much water. Daily syringing must be discontinued, only the floor being damped down, and if there is a water-tank in the fernery, it may be uncovered, when but little damping need be done. The glass should be kept clean and bright, and air afforded freely by opening the side-lights in mild weather. Temperature 55° to 60° by night, and 65° to 75° by day. In the temperate-house the same care will be required in watering, cleansing, and ventilation. The Australian and New Zealand species of Tree Ferns are usually grown in the conservatory or house of mixed plants, where it is essential they should have the best places. Look carefully for the small shell snails which often infest Ferns, and injure the young fronds of *Cyathea*, *Dicksonias*, and others, hunting for them at night by candle-light. If thrips should get on to the *Gleichenias* avoid fumigating them, but use lemon-oil instead. Keep the drainage of these plants in good condition, and for this purpose fertilising moss placed over the crocks is excellent. Afford air abundantly in mild weather. The temperature for the present may range from 45° to 50° by night; 50° to 60° by day.

HARDY DECIDUOUS FERNS under glass that are grown in pots for summer decoration, and now at rest, may be stowed away for the winter, laying the pots on their sides under plant stages or in a spare place which is cool, but not too dry. Some of the evergreen hardy species are indispensable for winter furnishing purposes, viz., the many beautiful forms of *Adiantum capillus-veneris*, *Aspleniums*, *Blechnums*, *Hymenophyllums*, *Polystichums*, *Scolopendrium*, &c., should be maintained in a clean state and well supplied with water. They succeed well in a temperature of from 30° to 40° by night, 40° to 50° by day.

CINERARIAS.—Give these a cool, airy house or pit, where they can have a little shade from bright sunshine; a watering of clear soot-water will help them. Keep them clean by fumigation; and for mildew, dust the plants with flowers of sulphur.

EDITORIAL NOTICES.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.

Plants, Fruits, &c., to be Named.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

FRIDAY, Nov. 3—Dundee Horticultural Society.

SHOWS.

TUESDAY, Oct. 31—Portsmouth Chrysanthemum.
 WEDNESDAY, Nov. 1 { Kent County Chrysanthemum at
 Blackheath (two days).
 Barnstable Chrysanthemum.
 THURSDAY, Nov. 2 { Highgate and District Chrysanthemum.
 FRIDAY, Nov. 3 { Crystal Palace Grand Chrysanthemum (two days).

SALES.

MONDAY, Oct. 30 { Dutch Bulbs at Protheroe & Morris' Rooms.
 Plants, at Protheroe & Morris' Rooms.
 Dutch Bulbs, Border Plants, Lilliums, &c. (five days), at Stevens' Rooms.
 TUESDAY, Oct. 31 { Special Sale of Hardy Plants and Bulbs, at Protheroe & Morris' Rooms.
 Ninth Annual Sale of 62,000 Fruit Trees, at The Nurseries, West Drayton, by order of Messrs. J. Smith & Sons, by Protheroe & Morris (two days).
 Dutch Bulbs, at Protheroe & Morris' Rooms.
 WEDNESDAY, Nov. 1 { Dutch Bulbs at Protheroe & Morris' Rooms.
 THURSDAY, Nov. 2 { Dutch Bulbs, at Protheroe & Morris' Rooms.
 Plants from Belgium, &c., at Protheroe & Morris' Rooms.
 FRIDAY, Nov. 3 { Dutch Bulbs, at Protheroe & Morris' Rooms.
 Orchids, at Protheroe & Morris' Rooms.
 SATURDAY, Nov. 4 { Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT OHISWICK.—45°·7.

WHILST everyone admits in principle the propriety of conformity to the rule of priority in the naming of plants, in practice there are various deviations arising from various circumstances,

from personal differences of appreciation, from motives of expediency, from carelessness, or other causes. Differences of appreciation may be illustrated by the circumstance that some consider the rule of priority to apply to the specific name only, whilst others apply it to the binominal appellation composed of a generic and of a specific portion. LINNÆUS was the first to use this binominal nomenclature systematically and uniformly, and great has been the convenience of so doing. Others had occasionally, and without set purpose, used two names as part, or even the whole of the designation of the plants they were writing of; hence, it has come to be the general practice, as a matter of conventional expediency, to disregard all specific names anterior to LINNÆUS. But some object to this on the ground that there were great botanists before LINNÆUS, which is of course true, but if this rule of priority is to be strictly followed, we must, of course, go back to primitive and to what are practically pre-historic times. We have, in the case of LINNÆUS and those subsequent to him, some thing to go upon in the way of direct, well-ordered, and duly-recorded testimony—often, indeed, supported by authentic specimens. In the case of the older authors, such evidence as we have is generally shadowy, unordered, and not capable of substantiation by records or by the examination of authentic specimens. In spite of this fact, some botanists break away from the hitherto accepted convention, and seek out the earliest name or part of a name they can find which they suppose to be applicable to the plant, and adopt that as the correct species name.

Turning to the consideration of expediency, the question arises whether in exceptional cases it is more expedient to follow the rule of priority thus strictly, or whether it does not contribute more efficiently to the progress of science and the facilities for its investigation to deviate from it. It is no question of belittling an author, or of depriving him of his rights. It is the plant we want to know about, not the man. We are grateful to the botanist for the trouble he has taken on our behalf, we associate his name necessarily in every case with the history and synonymy of the plant, but not necessarily or invariably with its nomenclature.

The attachment of an author's name to that of a plant confers in itself no more credit on the man than the label affixed to PICKFORD'S van confers honour on that enterprising and valuable firm. It is simply a label for convenience of reference and facility of recognition. If this be so, a breach of the rule of priority when expedient is not a derogation from the merits of any particular author, nor a violation of any ethical principle, but simply a pardonable breach of a convention. The convention exists for convenience-sake only, and if it be found more convenient to break away from it, there can be no moral obliquity chargeable to the individual who acting under circumstances, follows the spirit, when he cannot always be tied to the letter of the law.

Of course the convention should never be broken without due consideration and valid reason. If it is heedlessly broken, the author lays himself open to the direct charge of carelessness, and to the indirect inference that his work is inaccurate.

We may illustrate the matter by referring to the nomenclature of the common Spruce, and that of the common Silver Fir. The name now most generally adopted for the Spruce is *Picea excelsa* of LINK, whilst the Silver Fir is very

generally called *Abies pectinata* of DE CANDOLLE. According to the strict rule of priority, neither of these names is correct, nor is it easy, so great is the entanglement, to say which is the correct name. Thus, generically, both the Spruce and the Silver Fir have at various times been included within the genus, *Pinus*, *Abies*, or *Picea*.

Specifically, the Silver and the Spruce have each received the specific appellations *Elate*, *Picea*, *Abies*, *vulgaris*, and *excelsa*. The Silver Fir alone has received the names *taxifolia*, *mas*, *femina* (!), *pectinata*, and *alba*. The Spruce has had the monopoly of the names *baldensis* and *cinerea*.

Hence, according to the practice usually followed at Kew, of considering the combination of the generic and specific names as the one to be adopted, and of attributing priority to the name proposed by that author who first puts a species into its correct genus, the name of the Silver Fir should be *Abies alba* of MILLER (1768). But this name has not been generally adopted, and if it were so now, it would be a source of confusion between it and the tree subsequently named *Picea alba*, and the difficulty of making research into the literature and history grievously intensified.

If, according to the neo-American plan, we go back to the first recorded name, we should have to write *Abies elate*, HOMER. But then we have no proof as to what HOMER or even THEOPHRASTUS, who used the same epithet, meant; and their descriptions would probably apply to any of the Silver Firs, and not to the one we now generally call *A. pectinata*. That the old writers did use the word in a general sense is shown by the fact that HOMER says *ἐλάτη οὐρανομηρης*, the heaven-reaching Fir, and THEOPHRASTUS *ἐλάτη ἡ ἀρῆνη*, the male Fir.

Assuming, as is now generally done, that the tree is an *Abies*, then the balance of usage and convenience is in favour of the term *Abies pectinata* for the Silver Fir, and as such it is chronicled in the *Kew Index*, of which we spoke recently.

In the case of the common Spruce, if we go back to THEOPHRASTUS, we have *ἐλάτη ἡ θήλεια* or the female Fir, whilst PLINY has *Picea*. We need not enter the tangled thicket of synonymy in this case, further than to say that if (as is now all but universal), LINK'S genus *Picea* be adopted we ought to call the Spruce either *P. vulgaris* or *P. excelsa*, both of which names were used by LINK, but of which the latter has in later times been adopted by common consent and general usage. If, on the contrary, we are to follow neo-American plan, we should have to call the Spruce *Picea theleia*; Theophrastus, or perhaps *Picea Picea*, PLINY; a re-duplication of names which, strange as it seems, some authors have not shrank from adopting in other cases.

These, then, are two instances where rigid adherence to a convention would defeat its very objects by introducing elements of contrariety, confusion, and uncertainty. Surely in such cases convenience, custom, and usage are preferable guides to follow. The completion of the *Kew Index*, one part of which is already published, will afford a complete record of names, and to that it will be to the general convenience to conform as far as possible.

Whilst referring to this subject, we may allude to the criticism of our correspondent, "A. H. K.," in a recent issue (p. 456), according to which we are in error in continuing to use such names as *Pseudotsuga* and *Pseudolarix*. Of course, linguistically and morphologi-

cally the names in question are quite without excuse; but names, as we have urged, are but conventions—mere tallies—and hence it would be more objectionable to frame new generic names than to retain the old ones. The genera in question we consider to be perfectly valid, and, therefore, it would, to our thinking, be an impertinence for us to give entirely new names simply on the grounds that the old names—are mere words—are objectionable.

illustration of new Orchids; most of them are of botanical interest only. *Thelasia* is remarkable for its nearly regular flowers. The species figured are mostly natives of various parts of India, so that the publication serves in a measure as the atlas to the *Flora of British India*, also edited by Sir JOSEPH HOOKER.

TRAVELLER'S NOTES—Our readers will be pleased to hear that Mr. J. H. VEITCH, of the Chelsea Nurseries, who has contributed so many letters to our columns descriptive of his travels during the last

was resolved unanimously that Mr. Woods be appointed the President of the Society. With reference to the Secretaryship, Mr. JOHN ATHERTON had written, positively declining to continue to act; and after some discussion Mr. CHARLES PARKEE, of 11, Cannon Street, Preston, was appointed Secretary.

HORTICULTURAL COLLEGE, SWANLEY.—On Thursday evening, Professor CHESHIAE gave a lecture in connection with the Experiments Committee, on "Fruit Culture," illustrated by lime-light

FIG. 89.—VIEW OF BLETCHELEY PARK, BUCKINGHAMSHIRE. (SEE P. 534.)

LINNEAN SOCIETY.—The general meeting of the above, appointed to be held on Thursday, November 2, at 8 P.M., will be made a special general meeting, for the purpose of electing a Member of Council in the room of the late GEORGE BROOK, deceased. At this meeting the following papers will be read:—1, "A Contribution to the Phanerogamic Flora of Mato Grosso and the Northern Chaco," by SPENCER LE MARCHANT MOORE. 2, "On a new Freshwater Schizopod from Tasmania," by G. M. THOMSON.

HOOKE'S ICONES PLANTARUM.—The October number is entirely devoted to the description and

two years, arrived safely in London on Friday night, the 20th inst. Mr. VEITCH was a passenger from New Zealand in the ship "Ruahine."

PRESTON AND FULWOOD HORTICULTURAL SOCIETY.—A special meeting of the members was held at the Old Legs of Mau Hotel, Fishergate, Preston, on Saturday evening, the 21st inst., Mr. S. H. STOTT in the chair. The Sub-Committee reported that they had waited upon Councillor W. H. Woods, Esq., the Vice-Chairman of the Parks Committee, who had consented to take the office of President of the Society for the ensuing year. It

pictures, dealing with cross-fertilisation of flowers, fruit-bearing branches of Apple and Pear, and various nitrifying bacteria in the soil; also views of the Horticultural School of Versailles, and Agricultural School of Grignon, France. The lecture was very well attended. The next meeting is fixed for November 2.

"THE SHRUBS OF NORTH-EASTERN AMERICA."—This volume, prepared by Mr. C. S. NEWBALL as a companion volume to his work on trees of the same region, is intended for popular use, and will be found very serviceable. It is published

by Messrs. G. P. PUTNAM'S SONS, and contains descriptions and outline illustrations of many of the species. The outlines are rough, but characteristic. The Witch Hazel, *Hamamelis virginica*, is said to have the same properties of indicating the presence of hidden springs as the European or true Hazel. No doubt the tradition was carried to America, and applied to the *Hamamelis*. If, however, the notion is really indigenous, it would be very interesting. "Pond's Extract," a quack medicine, is prepared from the same plant, whose virtues were made known by an Oneida Indian. Do these or other Indians believe in the water-indicating properties of the shrub? Our wild Gueldres Rose is, we notice, called the Bush Cranberry, or the Cranberry-tree—deceptive names for the unwary. The book is well printed.

"A DICTIONARY OF BIRDS."—The second part of Professor NEWTON'S useful and freshly-written treatise brings the work to the article Moa. Among the more important articles are those relating to "Geographical Distribution," the principal regions adopted being New Zealand, Australia, Neotropic, Holarctic, Ethiopian, and Indian. Turning to detail, we note the statement that the nightingale does not extend beyond the valley of the Exe in England, nor much beyond York to the north. The Kentish plover is nearly confined to the coast near Sandwich and near Hastings. The red grouse, which is confined to this country, is asserted to be a local form of the widely-spread willow grouse. The article "Migration" is also one which will be read with interest even among those who are not specially interested in birds. Here, in the words of the writer, we are brought face to face with "perhaps the greatest mystery which the whole animal kingdom presents." "Mimicry," again, is an article to which all naturalists will turn, and many will be glad to see the prefix Unconscious added, and thus one source of misapprehension avoided.

BIRMINGHAM GARDENERS.—On the evening of October 23, at the Athletic Institute, the fortnightly meeting of the Birmingham Gardeners' Mutual Improvement Association was held, when it was unanimously agreed that Mr. A. W. WILLS, J.P., of Erdington, who is a warm supporter of the Association, and was the first inaugural lecturer at its institution some eight years ago, should be invited to become President for 1894, in place of the late Sir THOMAS MARTINEAU. The meeting was fairly attended.

THE ROYAL SOCIETY OF BOTANY AND AGRICULTURE OF GHENT.—At a meeting of this Society, held on the 16th inst., Mr. H. J. VEIRCH, of the Royal Exotic Nursery, Chelsea, was unanimously elected a Membre d'Honneur, in recognition of his services to botany and to horticulture.

EXMOUTH.—There was a good attendance at the meeting of the Exmouth Gardeners' Mutual Improvement Society at the Institute on the 18th inst., when Mr. W. SWAN, of Bystock, opened the second discussion, the subject being "Gardeners and Gardening." Mr. R. PIKE presided.

PISTILLODY OF THE POPPY.—The substitution of pistils for stamens is a phenomenon which has frequently been observed in a number of species of *Papaver*, and recently by K. SCHILBERSZKY, especially in *P. Rhœas* and *P. orientale*. It may take the form of the production either of partially open, or of entirely closed pistils. He regards this phenomenon as demonstrating the affinity of the *Papaveraceæ* with the tribe *Cleomeæ* of *Capparidææ*, and with the *Cruciferaæ*, and he argues (vide *Bot. Centralblatt*, lii., p. 416) that the pistil of the Poppy consists of as many carpels as there are placentæ or stigmatic rays.

THE IMPORTANCE OF HUMUS FOR PLANTS.

The part played by humus in the nutrition of plants has recently been critically examined by Dr. W. HÖVELER. Humus is always the result of the decay of animal or vegetable substances, and is of very complicated composition. It affects not only the chemical, but the physical properties of the soil, rendering it looser and capable of containing a lesser

quantity of water. In soil that is rich in humus, plants develop a much more abundant root-system. An elaborate paper by Dr. HÖVELER on this subject may be found in the *Jahrbuch für Wiss. Bot.*, xxiv., p. 283.

NATIONAL CHRYSANTHEMUM SOCIETY.—The annual dinner is fixed to take place at Anderton's Hotel, Fleet Street, on Thursday, November 30, at 6.30 P.M. The President, Sir EDWIN SAUNDERS in the chair, when the Challenge Trophy, Memorial, and other prize cups, with the medals, will be handed to the winners.

THE PRODUCTION OF ALBUMEN IN PLANTS.—Whilst it is maintained that phosphoric acid is necessary for the formation of albumen in plants, manuring experiments show that nitrogenous matter applied alone induces much growth, and this can only be due to the organised nitrogen, inasmuch as the most important vegetative phenomena proceed in the highly nitrogenous protoplasm. The chief reason against heavy nitrogenous manuring is not the waste of the most costly manure with insufficient representation of other manures, but the fear of injuring the crop, either through its becoming too bulky, in consequence of which the plants shade each other, and hinder the production of carbohydrates, or by prolonging the development of the plants, thus delaying ripening. Some experiments illustrative of these conclusions are described by A. MAYER in the *Landw. Versuchs Stat.*, xli., p. 433.

"A HANDBOOK OF THE DESTRUCTIVE INSECTS OF VICTORIA."—The Government Entomologist of Victoria, Mr. C. FRENCH, has prepared a second part of this very useful work. It is accompanied by numerous coloured plates, representing the insects in their various stages, and illustrations of the effects produced by insects on the plants. An appendix contains valuable information on spray-pumps and various insecticide solutions.

HOPS IN THE YEARS 1893 AND 1892.—We have received from the Board of Agriculture the following table, showing the estimated total production of Hops in the years 1893 and 1892, with the acreage and estimated average yield per statute acre in each county in England in which Hops were grown:—

Counties.	Estimated Total Produce.		Acreage.		Estimated Average Yield per Acre.	
	1893.	1892.	1893.	1892.	1893.	1892.

AUTUMN FLOWERS AT TRING PARK.—In the various beautiful little gardens at Tring Park, each of which is admirably arranged by Mr. Hill, the gardener, tuberous-rooted *Begonias* have made a more than usually bright display this season, and the plants are still as bright as ever. In the Elizabethan garden, the glowing colours of the beds of dark crimson, red, or yellow-flowered *Begonias*, seem all the brighter by contrast with the background of Yews and other Conifers. A remarkably dwarf, large-flowered strain of the three colours mentioned, is employed, and masses of each colour, with a suitable edging, are harmoniously arranged. Beds of *Anemone japonica alba* (Honoree Jobert) are also covered with

flowers, and these, with other autumn-flowering plants, make a good display. In the houses the Carnations still furnish numerous blooms; the Nerines are not yet over. The house of zonal *Pelargonium* is literally filled with bright-coloured flowers, and the *Bouvardias*, *Cyclamens*, &c., are in fine condition.

JAPANESE TABLE MATS.—The extension of the trade in what has become generally known as Rush or grass matting has been considerably marked of late. India and China, not many years ago, had the monopoly in supplying the English market with this particular kind of floor-covering, and since then Japan, Corea, and other places in the far East have followed up with mats of their own particular styles, so that our furnishing shops are being constantly supplied with some novelty formed out of native Rushes or Sedges. For smaller products than floor-matting, namely, those articles that are usually classed under the generic term of nick-nacks, we have become quite accustomed to look to Japan, and that progressive country is constantly supplying us with some new article of import. Quite recently we learnt that matches had become a special manufacture with the Japanese, who were able to turn them out so cheaply as to become formidable rivals with Germany and other European countries who are already well-known for the cheapness of their matches. The latest thing we have seen, however, of Japanese manufacture in the English market is a small mat, not for use on our floors, but for our tables—in short, dinner-mats, whereon the careful housewife stands her dishes with the view of protecting the table from the effects of the heat. These table-mats are considerably thicker than those in ordinary use, being about $\frac{3}{4}$ of an inch thick, the substance being made up of the twisted leaves of some species of *Andropogon*, covered very neatly with the flattened culms of *Carex rhynchophylla*, which at the edges and angles are twisted and formed into an ornamental design. These mats are probably not very durable, as they are made very loosely, and except under careful handling would probably become detached. They are said to be imported from Yokohama, and are sold at a few pence each, according to size.

LATE-BLOOMING POPPIES.—At Elham, Kent, in a Turp-field within a few yards of the railway, the common scarlet Poppies (*P. Rhœas* and *P. dubium*) are making a brilliant show, and, indeed, in other places near Folkestone. The plants are in splendid condition, dwarf, very shrubby, and covered with many buds. It can scarcely be that these are the same plants that were in flower in the spring; so is it possible that they are seedlings which the prolonged summer has allowed to come more rapidly to perfection than usual? In the spring we were surprised to gather Poppies and Primroses in the course of the same walk, but just now the Poppies combine with the fruits of the wild *Clematis* to produce a far more charming and decorative effect.

MADRAS FOREST DEPARTMENT.—The official Report for the year 1891-92 contains full details of the work done during the year. The receipts during the year, although less than in the previous year, were greater than in any other year, and considering the adverse season, it is remarked that the forest work of the Presidency continues to show steady progress.

CHESTER SOCIETY OF NATURAL SCIENCE.—At the annual *conversazione* of this Society, held on the 19th inst., the Kingsley Memorial Medal was presented by Her Grace the Duchess of WESTMINSTER to Mr. E. J. BAILLIE, F.L.S. "In recommending the presentation of the Memorial Medal to Mr. E. J. BAILLIE, his fellow-workers on the Museum Committee desired to acknowledge with gratitude the devotion to the best interests of science, which had been for many years a characteristic of his life. Mr. BAILLIE has given unlimited time and care to the inception and management of the Grosvenor Museum, and the committee felt the Medal had never been better or

more worthily given. The whole building would soon be finished, and it was confidently hoped that, with enlarged capabilities the good accruing would be commensurately extended." The museum at Chester is a model of what a local museum ought to be. As might be expected in such an ancient city, the antiquarian interests claim a great share of attention. The excellent life-studies of local birds and their nests, after the style so well seen at South Kensington, together with the large collection of illustrations of life-histories of injurious insects, form an important feature. All branches of natural science are represented, the specimens are restricted to those collected in the Society's district—Cheshire and North Wales.

MR. E. V. DUTTON.—This gentleman, who took the highest place at the last examination of the Royal Horticultural Society, has been appointed lecturer in agricultural chemistry in the University College of North Wales, Bangor.

JOHNSON'S "GARDENER'S DICTIONARY."—The seventh part of the new edition, edited by Mr. Wright and Mr. Dewar, brings the work down to the word *Sesbania*. As a cheap gardening dictionary, it is very serviceable. It is published by Messrs. BELL & SONS, York Street, Covent Garden.

A SECOND CROP OF FIGS.—Calling at Encombe, near Sandgate, recently (the scene, by the way, of the disastrous landslip which occurred last year), we were told by Mr. Brown, the gardener, that he was now gathering from standard trees in the open a second crop of ripe Figs.

PLANT PORTRAITS.

ZENOBIA SPECIOSA VAR. *PULVERULENTA*, *Gardeners' Magazine*, October 14.

TREES AND SHRUBS.

KOLREUTERIA PANICULATA.

This very beautiful low-growing tree is not so well known or planted as it should be. When in flower it is very brilliant, whilst during the autumn its leaves turn to a deep golden-yellow, and the tree is then very attractive; in fact, a tree here, some 30 feet high, has this autumn been a grand picture, making one of the finest bits of colour I have seen for many a day; yet, strange to say, few people seem to be acquainted with it. Many other picture-trees flourish in these gardens, and I would have taken a good collection of autumn foliage to the last meeting but one of the Royal Horticultural Society had my health not prevented my doing so. It is certainly a fact that our predecessors were better judges of suitable trees than the rising generation of either owners of estates or gardeners. *W. C. Leach, Albury Park Gardens, Guildford.*

CHRYSANTHEMUMS ABOUT LONDON.

THE PARKS.—Again the Chrysanthemum appeals from a thousand places to the sympathies of its admirers, nor in vain; and even those who in September did not much appreciate the stands of blooms that were to be seen at some of the shows, and had but little welcome for these unseasonable visitations of a popular flower even, are now as strong in their admiration as the veriest enthusiast could desire. The fact is, the Chrysanthemum is essentially an autumn flower, and its popularity has not been gained, nor will it be

increased, by growers attempting to keep them with us during the whole year. However, everybody welcomes the Chrysanthemum as queen now, and we cordially extend our congratulations to the authorities who are responsible for the excellent displays provided in the parks, &c., of the London County Council. It is to these collections that the millions are indebted for the opportunity to view at all times, and without cost, the prettiest floral sight it is possible to see at this season.

It being impossible to conceive any difference of opinion as to the elevating or humanizing influence of time spent in such manner, this point needs not any argument of ours to enforce, but it may be well to remember the value of these exhibitions that we may not be wanting in appreciation should we visit any of them. Then too, they are the means of much enjoyment to the amateur, who is unable to grow in his small collection many of the varieties he may wish, for at the parks he can see a good number of kinds side by side, and can estimate their qualities according to his degree of technical experience, taking note as to any he may decide to include in his purchases during the next season; and he can also compare his own plants and flowers with those to be seen here, that he may have some guide as to how far he has succeeded in the treatment he has accorded them.

Progression is by degrees in most things, and if we have anything to regret in regard to such displays, it is that there is still a lack of tasteful grouping in regard to their arrangement. Banks of large blooms budded together as closely as possible do not appeal to the artistic instinct as would nicely arranged groups that the visitor might pass round, and where the whole display is not glaringly visible as soon as the doorway is reached. But it would be unfair to blame the superintendents in this matter, because the houses are all too narrow for such arrangement; as time goes on we may hope to see larger and wider houses for the accommodation of winter flowers in our parks, and then the way will be opened for improvement in the direction indicated. Another hint we may venture to make is, that the directions posted in the parks as to where the display is to be found, can hardly be too plain or too numerous. In one instance, we ourselves were about half-an-hour after gaining the park before the house could be found that was the object of our visit. This, however, could hardly happen on Saturdays or Sundays, when the stream of visitors is so constant as to be sufficient guide in itself.

BATTERSEA PARK.

Only about a mile and a-half from Clapham Junction—one of the busiest stations in the world—this park is reached as easily as any in the metropolis; trams run direct to the park, and from the Victoria district visitors can book to the Battersea Park Station on the Brighton Railway, which is only about two minutes' walk from one of the entrances.

When the park has been gained, make the best way to the western entrance, a little below Chelsea Bridge, and close to the Albert Road, where a very fine display of Chrysanthemums will be ready for your inspection. It is just a week since we had the pleasure of a visit, and it was one of those fine autumn mornings that helps one to appreciate fully a walk through a pretty well-arranged park, such as Battersea, where may be observed the infinite tints in the passing foliage of the trees and shrubs.

The Chrysanthemums are arranged in the same house as last year, but in a rather different manner. Instead of one wide, sloping bank, there are two groups, one on either side, with a path running through the centre. On the whole, the arrangement is an improvement, but is still far different from that we should like to see, but which, perhaps, is impracticable in a house of no greater width than this one. The best has been done with the means available, and the plants, healthy and vigorous, are, we think, an advance upon those of last year.

It is pleasant to note that some of the newer varieties have been added, and one of these, which will be sure of much admiration, is William Seward, lovely crimson, and florets of great length and substance—it is one of the very best of the coloured Japanese. J. Shrimpton, too, is another new one of last year, and is very similar to the one just mentioned; it is bright crimson-scarlet, with golden reverse, and will no doubt become very widely grown.

Of older kinds especially noticeable, the following may be mentioned:—Edwin Molyneux, in capital condition; Avalanche, with large smooth bloom so thoroughly distinct; Albéric Lunden, a good flower, but peculiar in colour; Clement Audiguier, a pink Japanese in very fine condition; Florence Davis, which meets with much appreciation from many "mum" lovers, was well represented, but the flowers were not fully expanded; William Holmes, and Mdlle. Lecroix, the latter a good white bloom; Lady Selborne, Lord Wolseley, Bouquet de Dame, white, tinged with lilac; and Colonel W. B. Smith, one of the most popular varieties of last season, were all good. The last-named should be in every collection, from its very fine chestnut colour, and its peculiar and distinct twisting of the florets. Many more well-grown specimens of different varieties might be mentioned if space permitted, but sufficient has been said, perhaps, to induce any interested in these autumn displays, to include that at Battersea among those they will visit. Situated in such a populous district, the number of visitors is always large, and if notes are to be taken, and comparisons made, it will be better to go during the week, the crowd usually present on Saturdays and Sundays being so great. Last Sunday there were between 3000 and 4000 people. The house contains about 2000 plants, and there is a reserve of about 200 for succession. Mr. Coppin, the superintendent, and his assistants, are to be congratulated on the result of their efforts.

SOUTHWAOK PARK.

When we visited this park last year the accommodation then existing and available for Chrysanthemums was quite inadequate, and we are glad to find that a new portion has been added to the house, at an expense of something like £500. The house, as it now stands, is in the form of a half square or triangle, each wing measuring 45 feet long, and 24 feet wide. They are span-roofed, and from next spring the house is to be opened to the public as a summer and winter garden, which will no doubt be much appreciated by the people in this poor and congested district. The arrangement of the plants here as last year, is not quite the same as seen in most of the parks. There are plants all round the sides of the house, and paths intervening between these and centre groups with serpentine verge. This is the only place we have visited at present where there has been any departure from the "bank" system. Plants of *Cobaea scandens*, trained along some of the rafters, also tend to enhance the appearance of the whole. Of all the parks under the County Council, this one is least favourably situated for the growth of Chrysanthemums, and great praise is due to Mr. W. Bailey, the superintendent, and to his assistant, Mr. D. Carson, for the display they have succeeded in presenting. There were not many of the newer varieties in the collection, and the incurved section being rather later than the Japanese, was not represented by many blooms at the time our notes were taken. There were some fine flowers of Madame Louise Leroy, a pure white full flower, with pleasantly-twisted florets; and that rich golden-yellow variety, Gorgeous, also attracted attention. Charlotte de Montcabrier was present in numbers, it is a pretty, rather flat rose-coloured Japanese. The very finely coloured Mrs. William Walters was also noticeable. Ed. Molyneux, Peter the Great, George Gordon (very large), Monsieur Astorg, Mdlle. M. Farbe, Mr. Bunn, William Holmes, and Elaine, are others that will be admired. Louis Bohmer was just opening its buds, it being the only representative of the "hairy" section we noticed. The park is

about seven minutes' walk from South Bermondsey Station on the London, Brighton, and South Coast Railway.

THE INNER TEMPLE.

It was in the gardens belonging to the Benchers of the Inner Temple that the first display of this kind was opened free to the public, and it has never failed upon any occasion since to maintain its own precedent. This year Mr. Newton has got much better flowers than were there last season, and some of them will compare with the greater part of those to be seen elsewhere. The accommodation is very small, however, and the disadvantages necessarily inseparable from cultivation so near the centre of the metropolis has been against the plants, which appear to have had great difficulty in preserving their foliage, a fact that is exposed perhaps unduly by the manner in which the plants are staged, admitting of no edging in front. The blooms are good though, and visitors will be able to see many of the latest novelties. The white variety of Louis Bœhmer had some good blooms, and will this year be a much-admired flower. Some of the largest flowers were of the following varieties:—Viviani Morel, Albéric Lunden, W. K. Woodcock, Miss Minnie Newton, a pretty yellow Japanese; F. A. Davis, Sunflower, La Triomphant, Colonel W. B. Smith, W. A. Manda, Bouquet de Dames, Mr. Chas. E. Shea, A. H. Neve, and Prince of Wales.

ROYAL EXOTIC NURSERY, CHELSEA.

Those who were able to visit the meeting of the Royal Horticultural Society at the Drill Hall on Tuesday last, would be sure to notice the group of fine Chrysanthemum plants staged by Messrs. J. Veitch & Sons. The collection at Chelsea this season is superior in the quality of plants and flowers than is usual. The plants are well grown, stiff, with good foliage, and the flowers are very large and well formed on the plants, that have been cultivated to produce exhibition blooms. Just now a large span-roofed house is filled with a collection of the choicest and newest varieties only, and in another week or so, a very good display will be there. We can only notice a few of the novelties, and others of the more prominent varieties. William Seward is in fine form, and has splendid crimson florets of great length and substance; the variety is becoming so popular, that it now needs but little description. L'Enfant des deux Mondes is a very free white hairy flower, and is much after the character of Louis Bœhmer. An American variety, G. W. Childs, has a handsome flower of deep crimson shaded with gold; it is a short grower, and was not at its best when these notes were taken. Beauty of Exmouth is a pure white variety, good for every collection. Miss Dorothy Shea is a capital bloom, of bright terracotta colour; its florets have buff reverse, and are broad and rich.

Another of the new crimsons is J. Shrimpton; it has very flat florets, and is not a tall grower. Madame Thérèse Rey was only certificated at the last meeting of the National Chrysanthemum Society; it is a handsome flower, not quite white, but pleasing cream-coloured, with pale yellow towards the centre. Robert Owen, the new incurved Japanese, was not yet out.

Some good blooms of the incurved Baron Hirsh were to be seen, and Miss Anna Hartshorn was particularly noticeable; its florets are very broad, white, and they are less flat than many of the whites. Some extra large blooms of Colonel W. B. Smith were on plants that were raised from late cuttings, but they lacked colour, and were not so good as other and smaller flowers on older plants. G. C. Schwaba is a very fine Japanese of distinct carmine, with gold reverse, and which, when the flower is opening, is very pretty indeed. President Borel is useful, because its colour is not common in Chrysanthemums—rose, with yellow reverse. Some capital blooms of Louis Bœhmer will commend themselves to some who dislike this variety when but indifferently grown. Other ex-

cellent blooms were Florence Davis, Stanstead Surprise, W. H. Lincoln, Ed. Molyneux, and Mons. R. Bahuant (incurved).

(To be continued.)

HOME CORRESPONDENCE.

HYDRANGÆA HORTENSIS.—Where this plant produces blue flower-heads in the natural soil it is entirely owing to some mineral constituents in the soil; because I know of gardens that produce both pink and blue flowers, and the soil differs in the various parts where the change of colour takes place. Generally, where the blue flower-heads are seen the soil is clayey; I have not observed blue flowers in sandy soil. Perhaps the finest bush with blue flowers that I have noticed is growing close to Torquay in the "wild garden" belonging to Mr. Mallock, but this is not of an intense shade of blue as some that I saw at Melchet Court, near Romsey, some years ago. When Hydrangeas are grown in pots, sulphate of iron added to the soil at the rate of $\frac{1}{2}$ lb. to 1 bushel of ordinary compost, will give the desired blue colour; and directly the flower-heads show, the plants should have some alum-water given them alternately with clear water, at the rate of $\frac{1}{2}$ ounce to 1 gallon of water. In supplying the plants with this latter there must be no lack of attention, the alum-water must be continuously supplied to the roots. S. [Is a change of colour ever seen in *H. paniculata*? Ed.]

SECOND-CROP APPLES.—As an example of what the exceedingly mild season is doing in Bute, I send you a second-crop Apple 2 $\frac{1}{2}$ inches in circumference, and some others just beginning to swell, also an Apple-blossom. These were growing in Councillor Wallace's garden, close to the sea-shore in Rothsay. Laburnums in some places are in flower, and on every side there are indications of the prevailing mildness. Many herbaceous plants here are continuing in flower long past their usual time, while others are blooming a second time. M. Cuthbertson, Public Park, Rothsay.

TRANSPLANTING.—The recent heavy rains, so much needed, and so acceptable, should make nurserymen busy. But for the rains, they would have been in bad case, for whilst trees and shrubs have made far better growth than could well have been expected, the soil about the roots previously was so dry, that to lift or to plant seemed to be suicidal. Now all is changed; not that the rain has penetrated deeply, or that the soil is exceptionally moist—it will need a full winter's rain to get it into that condition, for once deeply dried it takes an immense rainfall to again moisten it, so that deep roots may be benefited. But nurserymen will become active only when customers are equally so. Were these wise, they would send in their orders for trees and shrubs as early as possible; the man who has first pick gets the best; the man who gets first served has the cream of the autumn and early winter, during which his new plantings may get established. Trees and shrubs, even when apparently in a condition of perfect rest, yet when then are newly planted, soon make new roots. Indeed, within a month or so the minute fibres seem to have been emitted, and are already *en rapport* with the soil, seeking for and finding food and moisture; then, when the spring comes, and the warm sunshine literally compels leaf development, the roots are full of life and vigour, and are capable of supplying all the demands that Nature may make upon them. How much better, then, is the result than is the case when the transplanting has been left until the late winter. But the active autumn season is too frequently but a short one. Very soon after leaf-fall comes frost, and if it be hard frost of some weeks duration, how often does it happen that the winter is all over, and the season has been lost, whilst the transplanting remains unaccomplished. To delay ordering from the nursery is to trifle with a whole year, for if the season be lost, the year is lost too. Even in the case of a dry summer, that may follow upon a late planting, how much risk is run! This past season saw myriads of trees and shrubs die utterly because they were not autumn transplanted. Those that were so did fairly well; those that were left till February and March have failed wholesale. Another reason why transplanting should be done in the autumn is, that very often other work is hindered until that is complete. It may be that it is in an orchard, or a shrubbery, or plantation, or in

an ordinary kitchen garden, and in all cases it is important that planting or cropping of ordinary descriptions should be done early also. How advantageous it is all round to have a clear field for the performance of this needful labour in the early spring, when the planting of trees and shrubs is done, the soil about them made neat and even, a mulching of manure laid about the roots, the colder air above serving to force root-action in soil that is several degrees warmer. A. D.

QUERCUS MIRBECKII (Q. PRINOS?)—With this I have sent you specimens bearing acorns, and would here mention that this species of Oak is a great favourite with His Grace the Duke of Northumberland. It is a fine tree, rapid in growth in very wet, sandy soil, with large foliage, and it is, moreover, nearly evergreen, thus forming a striking object among other trees. I have not seen it in a fruiting state before, but I dare to say that you will have seen specimens before. W. C. Leach. [The specimen sent was *Q. Prinos*, the Chestnut-Oak of the United States. Ed.]

LARGE PEAR, UVEDALE'S ST. GERMAIN.—It may possibly interest your numerous readers to know that I recently gathered seventeen Pears (Uvedale's St. Germain) from a small tree, six of which weighed 12 lb., the largest pulled the scale at 2 lb. 10 oz., a very fine specimen in form and colour. The circumference of this Pear is round the base 16 inches, lengthways 19 $\frac{1}{2}$ inches. Douglas Keran.

THE LENGTH OF LIFE OF A PLANT OF PHALÆNOPSIS.—With reference to Mr. S. Courtauld's note regarding the length of life of *Phalænopsis*, I may mention that I have seen thousands of *Phalænopsis* in a wild state, and some of extraordinary age and dimensions, such as would scarcely be believed by growers at home. (See note regarding *Phalænopsis Tetraspis*, *Orchid Review*, vii., p. 209.) I feel quite convinced that I have seen many plants one hundred years old. I can at the same time quite understand a traveller being misled into thinking the *Phalænopsis* short-lived, unless he penetrated the far jungles, or visited the tropical islands. These delicate plants flee before civilisation; the clearing of a breadth of jungle for cultivation in their neighbourhood will destroy the plants, in consequence of the reduced amount of moisture in the atmosphere. Also plants brought in from the jungle and grown in the open in the east never do well. These circumstances will also account for the opinion expressed by Mr. Courtauld's friend. I feel sure that any collector who has penetrated far into the interior away from cultivation, or visited the islands situated in the tropical belt of continuous rainfall, will agree with me that the *Phalænopsis* is by no means a short-lived plant. Most of the varieties which are difficult to grow come from the islands in the tropics, the atmosphere of which we cannot imitate. I am of opinion that evaporating troughs or hot pipes through tanks are injurious to the health of *Phalænopsis*, especially in winter. I find that there is nothing better than Oak leaves, 1 foot deep in winter. By keeping Oak leaves damp sufficient moisture is given off to keep the leaves healthy, and the necessity of watering is much reduced. I have healthy plants now in my *Phalænopsis*-house collected by me in 1880. Emeric S. Berkeley.

I cannot let Mr. S. Courtauld's note in *Gardeners' Chronicle*, Oct. 14, p. 458, pass without comment. I should much like Mr. Courtauld to see our plants of *Phalænopsis Schilleriana*, *P. amabilis*, *P. grandiflora*, *P. Stuartiana*, and *P. violacea*, which have been cultivated for the last twelve years to my certain knowledge, and also long before I took charge of this place. I can assure him that these plants have always flowered well each year for the period of time I have named, and the past summer they made leaves larger than ever before. Some of the plants of *P. Schilleriana* have made two leaves 16 to 18 inches long, and 5 to 6 inches wide. Old plants of *P. amabilis* have as many as ten fine leaves on one stem; other plants with three growths having from six to eight leaves each, which measure from 9 to 12 inches, and in some cases more. *P. grandiflora* has been grown here the same length of time, and possesses seven grand leaves; and one plant of this species which was staged at the Manchester Whit-sun-week show this year, and stood there a full week, carried a spike of twenty-four fully expanded flowers; and afterwards the plant was pulled out of the old cylinder, and placed into a new one. It is now just furnishing the second leaf this year—in

fact, since June. I might give the measurements of a number of plants, but my note would, I fear, be too long. I have no hesitation in saying that *Phalænopsis* may be grown for as long a period as either *Dendrobium*, *Odontoglossum*, or any other Orchid, if the requirements of the plants are attended to. *W. H.*

VIOLETS AND FOGS.—The experience of a lady in the Regent's Park with respect to the difficulty experienced in the production of Violets in the winter is somewhat widespread, at least in and to a large extent on the western and southern sides of London. Even so far down as my old residence, 15 miles from Charing Cross, it had become very difficult to grow Violets, even of the hardy single Russian or Czar out in the open, and yet when I went to reside at Bedford, some twenty-two years ago, Violets flourished wonderfully, and seldom during the winter lost a leaf. Now it is not at all uncommon to see Violets quite denuded of leaves, showing only bare crowns, that, of course, in the spring produce poor and late flowers. There seems to be very little money in Violets now, at least on that side of the metropolis, and it does seem as if on the west side of London the fogs were the most destructive, because they prevail only when there are very cold atmospheric depressions, which usually come from the east. When south and west winds prevail, there are no fogs. A grower for market of double Violet plants by tens of thousands finds it absolutely needful to winter his stock in the form of runners or cuttings dibbled in very thickly into frames, or else planted out under hedges, and covered with mats during fogs and the prevalence of hoar-frosts. It seems in all this fog-cursed area almost needful to grow the plants in winter in greenhouses, for in these, by the aid of fire-heat, the harmful effects of fogs may be much mitigated. Plants so treated certainly would not, through annual loss of leafage, become weak or attenuated. The grower to whom I refer finds that wintering the young runners or cuttings only leads to the reproduction every year of fine robust plants, indeed his stock this autumn was remarkably strong and healthy. The great mischief done is found when black fogs prevail, and then one or two days' immersion in the foul vapour, especially if accompanied by white frost, suffices to kill leafage wholesale. After all, growers of single Violets by many acres for flower production, and their pickers, are thus the greatest sufferers. *A. D.*

POTATOS THIS SEASON.—With reference to the remarks of "Constant Reader," I have not this year grown any field Potatos, but have had just 32 poles or thereabouts for household purposes in my garden, which is on a very steep slope facing the west. One half of the ground has been cropped with *Magnum Bonum*. I do not recollect for years having had such a good crop, all round, in quantity and quality. The rest of the ground was cropped with various kinds for trial, with one exception, called *True Blue*, which I got from Germany; they have all cropped heavily for the quantity planted. One Potato, which I got in Spain, has done wonderfully well, and I shall keep it for a crop next year; I do not know the name of it, but on my return to London in November, I will bring a few for your identification. The Potatos on the higher ground of the garden slope were all larger than lower down, the soil being the same throughout. I have no doubt I should have had but a poor crop in this late dry season but for having facilities for obtaining water. I am experimenting with the black Potato which I mentioned to you last year, but am disappointed with the size; I have, however, had a few cooked, and I am so satisfied with their taste, that I am keeping all I have for seed. *J. A. C.*

"Constant Reader" may be interested to learn that his case is not at all a singular one this year, but it would seem as if this supertuberation to which he refers had been found more developed in the *Magnum Bonum* section than in any other. Of course, it is entirely due to the unusual drought of the summer checking tuberation, then followed cooling showers, which did not go deep enough to affect the roots of Potato plants, but did suffice to create a new activity amongst the tubers, and mostly so in those that were nearest to the surface. But a few weeks since, I assisted in the lifting of some thirty-six diverse varieties of Potatos that had been planted for trial on a very open piece of ground in Surrey. The soil was dry when the planting was done, it was almost as dry when the lifting was performed, and yet in numerous cases quite large crops resulted. But I

was particularly struck with the fact that, whilst supertuberating was not appreciably evident in the bulk, it was so marked in four varieties that were of the true *Magnum Bonum* type, that these call for special mention. They were *The Bruce*, *Stourbridge Glory*, *Reading Giant*, and *Congress*, all the tubers being more or less elongated or grown out at the crown end, some of them most ungainly, and few that had any decency of form. The result satisfied me that this supertuberating was as much due to soil or strain as to season, for other fine varieties, *Chancellor*, *Prime Minister*, *Satisfaction*, *Her Majesty*, *The Dean*, *King of the Russets*, *Jeanne Deans*, *Triumph*, and others, retained their forms admirably. But under no circumstances should these *Magnum Bonum* forms be discarded because of the accident of a season. Round or flattish-oval forms do not lengthen with new growth as long kidneys will. Of course, the trouble would not have come had the season been moist, or a few waterings could have been given. After all, no great harm has been done, as there seems to be generally a heavy crop of Potatos. *A. D.*

ODONTOGLOSSUM AND PHALÆNOPSIS.—An explanation (replying to "G. S." in last week's issue of the *Gardeners' Chronicle*, referring to the above subject, I may say that it is an error, and should have read, "*Odontoglossum Phalænopsis* should, after this date, be placed at the cool part of the stove, or where the warmth is not less at night than 60°. *Miltonia Roezlii* winters well in such a house." As I have not tried to grow *Odontoglossum* and *Phalænopsis* together, I cannot say how they would succeed, but I do not see any reason why they should not be so grown. *W. Holmes.*

RYECROFT HALL, AUDENSHAW, NEAR MANCHESTER.—I paid a visit the other day to the above place, the Lancashire home of *Abel Buckley, Esq., J.P.*, and saw a most unusual sight for the middle of October, namely, a fine crop of Strawberries in a span-roofed house; this, of course, is mainly owing to the extraordinary season we have had. In fact, the fruit I saw was a reflection of the season. The kinds consisted of *Laxton's Noble and President*, and the plants had produced a good crop in the early spring. The locality is not favourable to horticultural pursuits, consequently the result is so much the more satisfactory. Roses and plants of a decorative character for home use are largely grown. The subject of domestic gardening is one that should occupy the attention of gardeners to a much greater extent than is the case in many instances; there are so many plants now in cultivation suitable for the purpose I have named, that no house need be without a plant to beautify the home. In a large mansion like *Ryecroft Hall*, in which Nature and art to adorn the home combine, what charming scenes can be produced by a judicious selection of plant-life associated with the artist's productions! This blending of the two is a subject worthy of careful consideration. Mr. W. Hough, the gardener, loves his work, and therefore it need hardly be said that the gardens and surroundings are well kept. *Bruce Findlay.*

THE KEEPING OF APPLES AND PEARS.—I do not know if it is generally the case this season, but we find Apples, Pears, and Quinces keep badly this season, and particularly *Kibston* and *Blenheim Orange Pippins*, and *Wellington Apples*; and of Pears, *Marie Louise*, *Comte de Lamy*, *Doyenné du Comice*, and *Knight's Monarch*. It is not injury done by wasps which is causing the fruits to decay. Quinces are decaying in the same mysterious manner, and 2 bushels of these fruits rotted which were gathered only a few days since. Many fruits of *Marie Louise Pear* have decayed on the trees here, and in this district. *W. A. Cook, Compton Bassett.*

PASSIFLORA QUADRANGULARIS.—I am sending you with this a box in which I have packed two fair-sized fruit of this edible Passion-flower; I have also pressed in two leaves with them. We have still a few fruits hanging on several plants, one being in a pot in an ordinary stove, and another planted out in a *Banana-house*. From some cause or other these invariably show flower and ripen their fruit much later than our most prolific plants. These latter are planted out in a portion of bed in a *Pine-stove* facing due south. The house is a lean-to, 8 feet 6 inches high at the back, 50 feet long, only one path, which is at the back; over this path the *Grenadilla* is trained, and grows most vigorously. The plants early in the spring are cut back nearly to the old wood. With a brisk temperature shoots soon

appear; the strongest are retained, and tied along the wires. By about May the whole space is covered. Flowers open very numerous; each one was fertilised until some 200 were set; these rapidly swelled up as large as those sent, and as they ripened were used as a grand addition to the dessert. By July and August the whole were gathered, when another good crop of flowers appeared, and were set; this second crop numbered over 170; these, too, swelled up and ripened, and were all gathered by the end of September; so now, as I intimated, our season with this fruit is still continued by those in two other houses. We find this form rather disposed to harbour filth, but the constant application of the syringe has kept it this season remarkably clean. Altogether, we have this season gathered nearly 500 fruits. On cutting the fruit through a very thick rind is observed, which encloses the seed embedded in a rich juicy pulp. This portion is eaten. At first, some dislike the taste; but almost invariably, as soon as the first novelty is over, a request is given for a second venture. The fruit is very highly esteemed here. *W. Swan, Bystock, Exmouth.*

LATE PEAS, ETC.—From seed sown on Aug. 17, we are now gathering splendid dishes of *Veitch's Chelsea Gem Pea*. I consider these Peas are the cream of early or late varieties; coming in now, they make a nice addition to culinary vegetables. We are also enabled to gather *Raspberries* and *Strawberries* in fine condition, and *Laxton's Noble* amongst Strawberries and the *Belle de Fontenay Raspberry* are wonderfully good. *W. A. Cook.*

SWEET-SCENTED GRASS.—The Sweet-scented American Grass that your correspondent, "J. R. H.," enquires about is *Hierochloa borealis*, R. and S. It is commonly known in this country as *Holy or Sacred-grass*, because it was formerly used for strewing on church floors on festivals. *The Students' Flora of the British Islands* gives its localities in Britain as *Witbanks, Thurso*, and formerly in *Forfarshire*, and its distribution, "*Arctic Alpine*, and *N. Europe, N. and W. Asia*, and *N. America*." Whether the smell of the British-grown grass is equal to that used by the Americans for making table-mats and various ornamental articles, I am not able to say by actual comparison, but the fragrance of the American articles always seems to be the most powerful. Though the grass is often used, as your correspondent says, in combination with *Birch-bark*, it is very frequently used alone for making into boxes, small baskets, table-mats, &c., which retain their agreeable fragrance for a very long period. There are good examples of these manufactures in the *Kew Museum*. *John R. Jackson, Kew.*

BATAVIAN ENDIVE.

PERMIT me to direct a little attention to this excellent vegetable, which is, in my opinion, the finest salading plant in cultivation at this season of the year. There is nothing at all comparable to it, and yet how little it is known, and how seldom seen. Beyond a few of the better private gardens it is almost unknown as a crop—you can scarcely find it in *Covent Garden*, and it is rarely to be seen on the exhibition table. Everywhere you meet with curled *Endive*, beautiful to look at, but for quality not to be named on the same day. It is strange how this neglect or this preference should arise; it cannot be on account of any difficulty in its cultivation, for nothing could be simpler or easier. It is even more so than the curled, and every gardener knows how very simple that is.

There are, broadly speaking, two classes of *Endive*: the curled-leaved and the broad-leaved or *Batavian*; with the former I have no concern at present beyond expressing my admiration of the beautiful white "cushions" of curled *Endive* which comes from *France*, and may be seen garnishing the dining-rooms in and long after midwinter, when we have not a scrap left, notwithstanding all our skill and care.

There are several varieties of the *Batavian Endive*, some suitable for summer and autumn use, some for winter. The winter varieties do not succeed well in our climate, so may be dismissed. The variety I want to bring to the front is called by Messrs. *Vilmorin* "*Broad-leaved or Batavian*," by Messrs. *Veitch & Son's* "*Improved Round-leaved*," and by Messrs. *Barr & Son* "*Broad-leaved Green Batavian*,"

and may be seen growing with several others in the gardens at Chiswick.

As already stated, the cultivation of Endive is extremely simple, being similar to that of Lettuce: one point is, that of sowing at the proper time; if sown too early, they are apt to bolt, i.e., run to flower—and if too late, they do not form hearts, and are then worthless. A good deal depends on the season, but the beginning of July may be reckoned a good time. It is well, however, to make two or three sowings when the conditions are favourable. The plants grow to a great size, forming large rosette-like hearts; the leaves incurving and hooding over, thus partially becoming blanched. To have them in perfection, the heads should be tied up some six or eight days before being required. When ready, the blanched hearts, almost as large as young Cabbages and clear as ivory, are beautiful to look upon. There is a tenderness and a crispness about it also which does not pertain to the curled Endives, and a nuttiness of flavour which is not found in Lettuce or Celery. Let those who doubt it try. *B.*

BLETCHLEY PARK.

AN hour's run on the North-Western Railway from Euston takes us through an interesting and varied stretch of country. We pass through part of Middlesex and Hertfordshire into Buckinghamshire, in which county lies the subject of our illustration. There is little or no historical interest attached to this part of Buckinghamshire that is worthy of mention here, and Bletchley Park, until about ten years ago, when its present owner, H. S. Leon, Esq., M.P., took it in hand, was so much grazing land. To illustrate what a clever, painstaking gardener can do, it is no exaggeration to say that Bletchley Park can take its place among the foremost of our English gardens, and no small amount of credit is due to Mr. A. Hislop for this state of affairs.

On arriving at the gates of the park, a splendid avenue of Elms cannot fail to excite admiration. It is about three furlongs in length, and composed of as even and well-shaped a lot of trees as one could wish for. The grounds in the immediate vicinity of the house are judiciously planted with handsome shrubs and Conifers, noticeable among which are nice specimens of *Abies Pinsapo*, *Abies Nordmanniana*, some shapely pieces of *Librocedrus decurrens* and *Thuia orientalis*. Immediately in front of the house is a fine bank of shrubs and Conifers, the whole backed by a well-grown Yew hedge, which serves not only as a shelter to the plants, but also to the house.

The summer-bedding is a good feature here, Mr. Hislop's style being to have groups as much as possible; thus we find here a bed of a bright *Tropæolum*, the neighbouring one being full of the dark variety of *Heliotrope*; further on, some bright foliaged *Pelargoniums*, the whole contrasting and blending harmoniously. There is a good Rose garden, and many of the finest varieties and latest novelties are grown.

The fruit and kitchen garden occupies an area of 4 acres, and that which strikes one very forcibly in this as in other departments, is the extreme cleanliness and tidiness maintained. Only the best and most useful fruit trees are cultivated, and a new garden has an advantage in this respect, as it can benefit by the experience of those of longer standing, and choose only well-trying and meritorious varieties for cultivation.

Fruit under glass is well represented, and this year has been an unusually good one, as many as 4000 fruit being gathered from a Peach-house 90 feet by 16 feet, the varieties principally grown being Noblesse, Sea Eagle, Royal George, and Princess of Wales. Nectarines are confined to one variety, viz., Pitmaston Orange. The early vinery is planted with Madresfield Court, Muscat of Alexandria, and Black Hamburg; while the late vinery is now in full bearing with fine crops of Gros Colmar, Black Alicante, and Bowood Muscat.

In a garden of this description, where all classes of plants are so well represented, it is difficult to say

what is the predominating feature; the first place, however, must be given to the Orchids, which occupy some five or six of the many houses found here. All kinds of Orchids are grown well, and each section bears testimony to the skill and attention afforded them. At the time of writing there is a very showy display of plants in flower, noticeable among which is a very fine strain of *Vanda cœrulea*, from Messrs. Low's last importation; the great size of the flowers, and the intense blue colour thereof, single them out from ordinary forms.

A useful and effective plant, flowering at this period, is *Cattleya labiata* var. *Warocqueana*, many fine forms of which are to be seen; some plants are exceptionally well done, having four and five sheaths, each sheath giving from three to five flowers. A glance at the following list of names of plants in flower will serve not only to show how successfully the plants are grown, but also the varied character of the collection:—*Cattleya maxima peruviana* may be seen carrying fifteen flowers; *Calanthe maculata*, a rare and curious little species; *Cattleya Bowringiana* in fine variety; *Cypripedium insignis*, old and new varieties; *C. Sedeni*, a fine specimen, and a good specimen of *C. Schlimii*, *C. Dominicanum*, and a superb variety of *Spicerianum* raised from seed by Mr. Hislop; *Lælia autumnalis*, *Perrinii*, *elegans*, *præstans*, *purpurata*, *Boothiana*? (just expanding); *Lycaste Skinneri*, *L. plana*, which flowers here all the year round. *Dendrobium macrophyllum*, yellow variety; *Cattleya aurea*, in several fine forms, are a special feature, and are well done; *C. Aclandiae*, of a very superior strain, introduced by Messrs. Linden, and out of which many new things have emanated; *C. gigas*, a fair variety, two plants of which were in flower; *Dendrobium Phalaenopsis* in variety, *Sophranitis grandiflora*, *Phalaenopsis amabilis*, fine form; various forms of *Odontoglossum Alexandræ*, *Cœlogyne barbata*, &c. One house is set apart for *Vandas*, and in addition to several fine varieties of *V. suavis* in flower, there are nearly forty spikes showing for flower.

A corridor, handsomely furnished with a rockery in which many varieties of Ferns luxuriate, runs at right angles with the Orchid-houses, which gives the owner the advantage of remaining in a uniform temperature during his stay in the houses, and also serves as a protection against cold and drying winds. The plants in flower are staged effectively between the Ferns on the rockery before mentioned, and produce a striking effect.

The hybridisation of Orchids is carried on here on a small scale, and many interesting novelties will doubtless be forthcoming in time. Stove-plants are well in evidence, leading varieties of *Crotons*, *Dracænas*, *Dipladenias*, *Ixoras*, &c., all making a pleasant brightness.

The greenhouse is at the present time well stocked with a fine lot of zonal *Pelargoniums*, whose large trusses and vivid colours almost shake one's faith in Orchids. In a house adjoining are to be seen 300 plants of *Calla Little Gem*, a large portion of which are in spathe. This is a very effective little plant, and does not in any case exceed 1 foot in height.

Conspicuous amongst a good and varied collection of Ferns is a fine specimen of *Davallia Mooreana*, 9 feet across, and the picture of health. A large plant of *Asparagus prostratus nanus* covers the roof of the fernery, and thus affords an agreeable and natural shade.

Chrysanthemums are good, "some splendid timber," crowned with rich, well-shaped blooms. A curious freak to be seen is a plant of *Chrysanthemum Charles Davis*, which is in a 6 or 7-inch pot, exactly a foot high, and bearing a flower exactly 12 inches across; no pinching or abortion has been resorted to to obtain this effect. If this character could be maintained, the plant would no doubt become valuable for many purposes, from which, owing to their great height, they are now excluded.

A few of the best kinds now at present in flower, are *Ada Prass*, a very pale pink, almost white, of fine size and substance; *Mohawk*, very dark brown; *Thunberg*, rich yellow, very bold flower; *Avalanche* taking foremost place in "whites."

There is a good lofty Palm House, not very large, but holding many specimens 18 to 20 ft. high, a very nice plant of *Areca Banerii* and *Seaforthia elegans*, being conspicuous, also a splendid specimen of *Cycas revoluta*.

Violets are extensively grown, "Lady Hume Campbell" being the principal variety employed; a good house is constructed for these, which is convenient for gathering the flowers, as they are easily reached from back and front.

Quantities of herbaceous *Calceolarias* promise to account for themselves later on, as do a good batch of the single red *Primula* and the double white. Carnations are here in abundance, both in quality and quantity. Many pretty plants of *Miss Joliffe*, *Winter Cheer*, *Duke of Fife*, and other useful varieties, are now showing flower. Taken all round the cultivation and order found in Bletchley Park makes one feel quite satisfied to go to the house-tops and proclaim himself a gardener. The photograph from which the engraving is made is by H. Bartholomew, of Newport Pagnell, Bucks, and was taken from the tower of a neighbouring church. *P. W.*

APPLE, HAMBLING'S SEEDLING.

UNDER this name, a new and remarkable Apple received a First-class Certificate when brought before the Fruit Committee of the Royal Horticultural Society on October 10 last. Major W. J. Hambling, of Dunstable, has obligingly furnished us with examples for figuring, and has also supplied us with the following information regarding the new seedling form. Major Hambling has for many years been in the habit of sowing Apple pips, and when the seedlings have become strong enough, he has grafted or budded them in an experimental way. Unfortunately, he has never kept any record of the parent Apples from which the pips have been taken, so that very little indeed is known of the parentage of the form before us. Hambling's Seedling appears to make the nearest approach to *Peasgood's Nonsuch*, but Major Hambling has never grown this Apple, and he is certain that *Peasgood's Nonsuch* is not the origin of his seedling; he thinks the original pips may possibly have been derived from Lane's *Prince Albert* or *White Admirable*, but he is quite uncertain.

Hambling's Seedling came up from an unknown pip; in due course it was grafted, and the graft failed, and the same result happened for two, three, or perhaps four years. In the meantime the seedling was making strong growth; the foliage was vigorous, notably of large size, dark colour, and, above all, the seedling began to show fruit-buds. Major Hambling then determined to see what fruit it would bear. The tree is now about fifteen years old, and has been bearing for five or six years. Each year the fruit increases in size and quantity; this year, on October 2 and 3, three bushels of Apples were gathered from it. Until last year the tree received little or no care, and, in fact, was neither pruned or cultivated. It grows on a calcareous soil.

Our readers will see by the illustration that Hambling's Seedling is large in size, and symmetrical in form. It is somewhat pale apple-green in colour, in ripe examples flushed with rose. Its keeping qualities are under experiment, but it is believed to be a good keeper. Its taste is very good, the fruits being suitable alike for dessert, cooking, or for making jelly.

Major Hambling cultivates Apples with great success; we learn that from a piece of garden-ground consisting of 10 poles only, he this year gathered 50 bushels of Apples.

SOCIETIES.

ROYAL HORTICULTURAL.

OCTOBER 24.—The meeting in the Drill Hall, James Street, Westminster, on Tuesday last was quite exceptional. The hall was filled with exhibits which included an unusual display of Orchids from leading nurserymen, and many acquisitions in this

order; also Dahlias, Chrysanthemums, and other plants and flowers. Fruit was present in considerable quantity; and vegetables, especially Onions, were present in quantity, and in first-rate quality.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. H. H. D'Ombraïn, G. Paul, J. Laing, R. Owen, H. Herbat, R. Dean, H. B. May, G. Stevens, R. B. Lowe, C. F. Bause, J. Jennings, C. J. Salter, J. D. Pawle, W. Bain, W. Furze, T. Baines, C. E. Pearson, W. H. Williams, J. Walker, J. T. Bennett-Poë, H. Cannell, and C. E. Shea.

yellow variety; and a bloom of *Carludovica palmata* was exhibited by Mr. Philip Crowley, Waddon House, Croydon (Vote of Thanks).

Messrs. W. Cutbush & Sons, Highgate, had a group of *Pernettyas mucronata*, well berried, the varieties *atro-sanguinea*, *nigra*, *rosea*, *macrocarpa*, and *alba* being the most useful for decoration (Silver Banksian Medal).

Mr. Thos. S. Ware, Hale Farm Nurseries, Tottenham, had blooms of *Cactus*, show and decorative Dahlias, in very fine condition (Silver Flora Medal).

Messrs. Cannell and Sons, Swanley, had a collection of single *Begonia* blooms, from plants lifted

A. A. sanguineum, and two or three seedlings. *A. Lindenii*, a fine large carmine-coloured spathe, was awarded a First-class Certificate.

Mr. C. Holden, 61, Warwick Road, Ealing, had an extremely large naturally-grown *Chrysanthemum*, bearing nearly 2,000 buds and flowers; the variety was *Sœur Méline* (Bronze Banksian Medal).

Mr. Anthony Waterer, Knap Hill Nurseries, Woking, showed a large plant (12 feet high), of an American Oak, with purplish-red foliage at this season. It was distinct and striking as a variety for its autumn effects. He likewise showed three plants of 4 to 5 feet in height of *Andromeda arborea*,

FIG. 90.—APPLE HAMBLING'S SEEDLING. (SEE P. 534.)

Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley, illustrated the exceptional autumn by a very good display of Dahlias in all sections, looking very bright. Awards of Merit were given to Mrs. Parrott, a single flower of carmine and white; and to Sir T. Montefiore, a very deep velvety crimson *Cactus* variety (Silver-gilt Floral Medal).

A First-class Certificate was awarded to fibrous-rooted *Begonia Gloire de Lorraine*, exhibited by L. de Rothchild, Esq., Ascott, Leighton Buzzard, gr., Mr. J. Jennings. It has showy rose-coloured flowers, is very floriferous, carries its flowers well above the foliage, is dwarf and rather slender in growth.

Mr. C. G. Van Tubergen, jun., Haarlem, Holland, sent spikes of *Kniphofia hybrida*, var. *Triumph*, a

from the open ground; also some *Chrysanthemums*. *Cactus* *Dahlia*, Cannell's *Brilliant*, a very fine brilliant crimson flower, was granted an Award of Merit (Bronze Banksian Medal).

A pretty group of foliage plants was put up by Messrs. Jno. Laing & Sons, Forest Hill, S.E.; also a few good blooms of *Chrysanthemums* (Silver Flora Medal).

Messrs. B. S. Williams & Sons, Upper Holloway, had a group of excellent *Crotons*, fairly large specimens, and well coloured (Silver Flora Medal).

Some magnificent *Anthuriums* were from Sir Trevor Lawrence, Bart., Burford, Dorking (gr., Mr. Bain). The following varieties were shown in capital form:—*A. Laingii*, *A. Leodiense*, *A. Andreanum*,

with foliage, now in decay, of a light-red tint, and terminal panicles of unopened white flower-buds. In a mass it is an effective plant at this season.

Mr. W. Pearce, gr., Floore House, Weedon, showed five plants well-grown, and very dark green and healthy, of *Davallia fijiensis*. These measured on an average 4 feet in diameter (Vote of Thanks).

The *Chrysanthemum* season is upon us, as was shown by the number of new varieties staged at the meeting of the Royal Horticultural Society on the 24th inst. Probably it is owing to the season, and perhaps something to the marked improvement in the varieties, that the October-flowering Japanese have been remarkably fine, as was instanced by what was seen at the Drill Hall on the above date. An Award

of Merit was made to plants of Rycroft Glory, from Mr. H. J. Jones, Rycroft Nursery, Lewisham, as a decorative variety, dwarf, and compact in habit; very free indeed of bloom, the colour deep gold, the flowers produced in large bunches; an excellent companion to the well-known Source d'Or, which is perhaps, one of the most useful *Chrysanthemums* in cultivation. To Mr. R. Owen, nurseryman, Maidenhead, for Japanese Miss M. Simpkins, a large creamy-white, broad-petaled, incurved Japanese, of a decidedly promising character; and to W. Herbert Fowler, a striking broad-petaled reflexed Japanese flower, and deep golden in colour. To Japanese The Tribune, shown both by Mr. H. J. Jones and Mr. C. E. Shea, Foots Cray, Kent, a large broad-petaled pale lemon-yellow flower, the centre tinted bright gold, Mr. Jones having a plant bearing three very fine blooms; also to Madame M. Ricard, a reflexed Japanese, deep pink in colour, very bright and pleasing, and likely to make a good exhibition variety, from Mr. Geo. Stevens, St. John's Nursery, Putney.

Of non-certificated flowers, Mr. C. E. Shea had Sylphide, a bright yellow Japanese, small but very pretty; and Bouquet des Dames, white, in the way of Elaine. Mr. R. Owen staged a number of blooms of Japanese of his own raising, such as James Myers, pale cerise, flushed with magenta, the reverse of the petals yellow, a reflexed flower; Thomas Wilkins, a large, striking, reflexed Japanese, of a chrome-yellow colour, highly promising; Richard Dean, of the Edwin Molyneux type, bright in colour, the reverse golden; Rose Wynne, a large, broad-petaled white flower, too shallow as shown, but decidedly promising; a number of very fine blooms of his fine incurved Baron Hirsch, which must be pronounced an excellent acquisition; also incurved, Permanent, which greatly resembles a blush Queen, but which was scarcely enough developed; Vice-President Jules Barignay, also incurved, deep amaranth, with a cinnamon reverse, that will no doubt be seen in a more finished form; Mrs. G. B. Darby, delicate pink, thin-petaled, full, and very pleasing; Mrs. P. Blair, blush, with white reverse, the surface of the petals flaked with magenta-purple, large, full, and very fine; Wilfred Marshall, a large broad-petaled pale yellow; W. Mease, pale bright magenta, with a silvery reverse, incurved; a fine bloom of the yellow Avalanche; and one or two others. Several of the last-named being represented by one bloom only, therefore the committee could not deal with them. A collection of bunches of small Japanese, also from Mr. Owen, well adapted for cutting, was much admired, they included Corneux, chestnut-crimson; Charles Billecart, bright golden-yellow; Madame Jules Mouquet, bronzy-orange; Ernest Irroy, pink, white and gold, very pretty; Crimson Queen, bright crimson; Dr. Jules Fabre, gold, edged with orange-bronze; and Fadette, soft pink. Messrs. H. Cannell & Son, nurserymen, Swanley, had the fine new reflexed crimson Japanese William Seward, very fine; Ada Prass, a delicate blush incurved Japanese; International, blush, the broad petals flushed with lilac-pink; and Madame Edouard Rey, a beautiful blush flower, tinted with lilac-pink, that must take high rank as an exhibition variety. Messrs. Veitch & Sons, Exotic Nurseries, Chelsea, had a group of Japanese varieties, plants bearing very fine blooms; and Mr. William Wells, The Nurseries, Earlswood, several stands of cut blooms of various types.

Orchid Committee.

Present: H. J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Sec.), Sydney Courtlaud, A. H. Smea, C. J. Lucas, Thos. Statter, F. Sander, E. Hull, J. Jaques, T. B. Haywood, H. Williams, J. Douglas, and H. M. Pollett.

This was one of the finest Orchid shows we have seen at the Drill Hall, and one of the most effective plants in all the various groups was *Cattleya labiata*. Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, had an extensive group, composed principally of varieties of *Cattleya labiata*, among them being some very distinct things. Of these we noted *C. labiata* delicata, almost wholly of a clear rose colour; *C. l. vivicana*, rose-pink, with yellow throat and small blotch on the labellum; *C. l. Jeannette*, with a very richly-coloured labellum, the dark crimson colour being continued round the side lobes of the lip; the varieties *C. l. bella* and *C. l. formosa* were also very pretty. Among other good things in their group, Messrs. Charlesworth, Shuttleworth & Co., showed their fine new *Cypripedium Charlesworthii* (illustrated in the *Gardeners' Chronicle*

October 7); *Cattleya Schofieldiana aurea*, *C. granulosa asperata*, *Cypripedium nitens*, with many flowers; some good *Oncidium varicosum*, *Cymbidium giganteum*, *Lælia tenebrosa*, &c. (Silver-gilt Banksian Medal).

Messrs. James Veitch & Son had an extensive group, consisting chiefly of new plants, of which some of the best were *Lælia-Cattleya* × *Pisanda* (*Lælia crispata* ♀, *C. el dorado* ♂), a very handsome hybrid, of compact growth, and with flowers somewhat resembling those of *L.-C. exoniensis*, the deflected front lobe of the lip being of very dark maroon-crimson (First-class Certificate); *Cypripedium* × *Clonius* (*conchiferum* × ♀, *caudatum Wallisii* ♂), a most elegant and chastely-beautiful hybrid, with flowers somewhat resembling those of *C. × conchiferum*, but with more attenuated petals. The pouch was clear waxy-white, the infolded lobes spotted with purple; the petals are white, with green lines, and rose-tinted, drooping, tail-like tips; the sepals are white, with a green veination (First-class Certificate); *Lælia-Cattleya* × *Eumæa* (*L. majalis* ♂, *C. labiata Trianaei* ♀), a very interesting hybrid, with pretty flowers, and distinct traces of *L. majalis* in the plant; *L.-C. × Cassiope* (*L. pumila præstans* ♀, *L.-C. × exoniensis* ♂), a charming thing; *Cattleya* × *Harrisii*, one of the most beautiful of hybrids, its flowers surpassing the best forms of *Lælia-Cattleya elegans*; *Cypripedium* × *T. B. Haywood*, *C. × Arthurium pulchellum*. Among other well-flowered specimens were several distinct forms of *Cattleya Bowringiana*; *Dendrobium Phalænopsis Schroderianum*, D. P. Statterianum, D. album, D. superbiens, D. formosum giganteum, *Cypripedium* × *ænanthum superbum*, *C. × Ashburtoniæ major*, *C. × radiosum*, *C. × Ianthe*, *C. Boisierianum*, *C. × macrochilum*, and many *Cattleyas*, &c. (Silver-gilt Banksian Medal).

A well-arranged group of fine Orchids came from Messrs. F. Sander & Co., two of their exhibits were quite remarkable, viz., *Cattleya* × *Lord Rothschild* (*labiata Gaskelliana* ♀, *Dowiana aurea* ♂), a plant of the free growth, and the round well-displayed lip of *C. Gaskelliana*, together with the colours and other good points of *C. × Hardyana*. The petals were more than 7 inches wide when stretched out, of a creamy-white, tinged with rosy-lilac, the veining silvery-white; the front of the lip is finely crimped and rounded; the basal and median portion of a clear yellow changing to white, where it extends into the ruby-crimson of the front lobe; the yellow veining in the throat has a marbling of crimson between the lines. The scent of the flower is delicious (First-class Certificate). The other plant alluded to was *Cattleya labiata Sanderiana*, a variety of very distinct form, the labellum being unlike that of any other *C. labiata*, and the whole flower of greater substance; the colour of the sepals and petals is of glowing crimson, having a tinge of violet, the labellum of the same rich maroon-purple colour seen in *C. Percivaliana* (First-class Certificate). Messrs. Sander also showed a fine white *Dendrobium Phalænopsis*, with a lip having a purple base; a large specimen of *Vanda cœrulea*, many of their importations of *Cattleya labiata*, *Lælia*, *Cypripediums*, &c. (Silver Flora Medal).

Sir Trevor Lawrence, Bart., Barford, Dorking (grower, Mr. W. H. White), sent the most extraordinary plant in the show; *Cirrhopetalum ornatisimum* with four spikes of its singular flowers. These are creamy-white and crimson in colour, the sepals having a crimson fringe at the edges, and the petals bunches of crimson tassels which move from the slightest cause (First-class Certificate). Sir Trevor Lawrence also sent a plant of *Cypripedium* × *concolorawre*, which carried three flowers.

Thos. Statter, Esq., Stand Hall, Whitefield, Manchester, exhibited *Cypripedium* × *Statterianum* (*Spicerianum magnificum* × *vexillarium superbum*), a very handsome hybrid with lightly polished yellow and dark chocolate petals and pouch, and beautiful upper sepal of a rich rose-purple edged with white (First-class Certificate); and *Lælia* × *Euterpe* (*crispata* × *pumila Dayana*), the same hybrid being also sent by Messrs. Heath & Son, of Cheltenham, who also showed a very distinct and pretty novelty in *Cypripedium insigne albens*, which had clear yellow flowers with pure white upper part to the dorsal sepal, and with only the faintest traces of the dark markings usually seen in the species (Award of Merit); and *Cypripedium* × (*insigne* × *siamense*).

Messrs. Linden, l'Horticulture Internationale, Parc Leopold, Brussels, showed some very fine forms of *Cattleya labiata*, the variety *Imshoohtiana* being an extraordinarily large plant, and the flowers of rich colour (Award of Merit). They also showed a form

of *Paphinia grandis* with very large claret and white flowers (Award of Merit); *Pholidota convallarioides* (Botanical Certificate); *Dendrobium lamellatum* (Botanical Certificate); *Maxillaria callichroma*, *Odontoglossum Mooreanum*, a supposed natural hybrid with *O. tripidians*; *Odontoglossum luteo-purpureum intermedium* (Cultural Commendation); *Cattleya Alexandræ elegans*, and *Cynoches chlorochilum*, which also received Cultural Commendation.

Messrs. Hugh Low & Co., Clapton, exhibited a group of Orchids, among which were good examples of *Miltonia Roezli*, *Odontoglossum grande*, *Cypripedium bellatulum*, *Lælia Dormanii*, *Cypripedium tonsum*, *Phalænopsis*, *Vanda Amesiana*, and *Saccolabium bellinum* (Silver Banksian Medal).

Messrs. W. S. Lewis & Co., Chase Side, Southgate, had a group of Orchids, comprising *Lælia-Cattleya* × *Schilleriana*, *L. Perriani*, *Cattleya labiata*, *C. Bowringiana*, *Cypripedium* × *delicatatum*, *Oncidium ornithorhynchum*, *O. incurvum*, *O. prætextum*, &c. (Silver Banksian Medal).

G. D. Owen, Esq., Selwood, Rotherham (gr., Mr. Watts), showed the true *Cattleya labiata alba*, and a splendid form of *C. × Hardyana* named *C. × H. Selwood var.*, and which received an Award of Merit. W. M. Appleton, Esq., Tyn-y-Coed, Weston-super-Mare, showed two noble forms of *Cattleya labiata*, the best, *C. L. Appleton's var.*, receiving an Award of Merit; *Dendrobium Phalænopsis*, Appleton's var., with white flowers, the outer halves of the segments being coloured bright rosy-lilac (Award of Merit); a very pretty form of *Cattleya* × *Hardyana*, a fine variety of *Oncidium Jonesianum*, and two *Cypripedium insigne*.

Walter C. Clarke, Esq., Orleans House, Sefton Park, Liverpool (gr., Mr. Thos. Jones), showed *Cypripedium insigne Clarkii*, a very distant and pretty form, with light and sparingly spotted flowers (Award of Merit); and a very good variety of *Cattleya labiata* Henry Little, Esq., The Barons, Twickenham, showed *Cattleya labiata*, Little's var.; *Cypripedium Elliottianum*, and *C. × calorum Lemoinei*. G. J. Poston, Esq., Bishopsford, Mitcham, showed varieties of *Cattleya Bowringiana*. J. T. Bennett - Peck, Esq., Holmewood, Cheshunt, showed *Odontoglossum Rossii*, Holmewood variety, which had some fine flowers in a very tall scape; and Sir Wm. Marriott, Down House, Blandford (gr., Mr. T. Denny), sent spikes of *Lælia furfuracea*, and *L. autumnalis Arnoldiana*.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. T. F. Rivers, A. Sutton, G. W. Cummins, Harrison Weir, H. J. Pearson, J. Cheal, G. Taber, W. Warren, J. Wright, A. Dean, G. Woodward, W. Bates, G. Wythes, F. Q. Lane, H. Balderson, J. Smith, G. Norman, Robt. Hogg, G. H. Sage, and J. Willard.

The competitive classes that had been arranged were only slightly contested, and in the class for Apples grown in the open there was no exhibitor at all, whilst for Grapes there was no competition in either class. Mr. Thos. Osman, Ottershaw Park Gardens, Chertsey, obtained 1st prize in each class for Grapes—in the one case for six bunches of Grapes, and in the other for an equal number of bunches to be judged in regard to flavour.

For six dishes of dessert Pears, Mr. J. W. Melles, Sewardstone Lodge, Chingford (gr., Mr. J. Nicholson), was 1st; and Mr. Thos. Osman, 2nd.

Mr. J. H. Goodacre, Elvaston Castle Gardens, Derby, had a collection of Apples and Pears in 120 dishes, very good in size and colour, especially the Apples (Silver-gilt Banksian Medal).

A splendid collection of Grapes was exhibited by Mr. Samuel Mortimer, Rowledge, Farnham, Surrey, including thirty bunches of Black Alicante, four bunches of Gros Colmar, and nine of Black Hamburg. The Alicante especially were capitally finished. Also a collection of Apples and Pears, in about forty dishes (Silver-gilt Banksian Medal).

A collection of Canadian Apples, in 100 varieties, was exhibited by the Government of Nova Scotia. They were much spotted, and had been bruised in transit, and were not at all equal, even in appearance, to those home-grown, although they were highly-coloured. Many of the varieties were our own, and some were strangers (Vote of Thanks).

Messrs. T. F. Rivers & Son, Sawbridgeworth, had a grand collection of Apples and Pears. Some of the Apples were very fine, such as King of Tomkins' County, Belle Dubois, Peasepod's Nonsuch, Lady Henniker, Melon Apple, Cox's Pomona, Bijou, Cox's Orange Pippin, King of the Pippins, Rymer, &c. (Silver Banksian Medal).

Mr. H. Deverill, Banbury, had a first-class collection of Onions, occupying more than half-way along one side of the house (Silver-gilt Knightian Medal). Deverill's Anglo-Spanish was present in very great quantity; Ailsa Craig, Rousham Park Hero, and the Lord Keeper, as well as Royal Jubilee, Deverill's Advancer, &c., all of the quality for which Mr. Deverill has long been famous.

From Mr. G. R. Allis, Oldwarden Park, Biggleswade, came three bunches of Gros Colmar Grapes grown on a garden wall without any protection—another instance of the abnormal character of the past season; also a dish of Tomatos (Vote of Thanks).

An Award of Merit was given to a seedling Apple named Bow Hill Pippin, and exhibited by Mr. A. L. White, Bow Hill, near Maidstone. The Apple is of good size, and not unlike to Blenheim Pippin in appearance.

A dozen Ribston Pippin Apples were from Mr. R. Weller, gr., Glenstall Gardens, Murroe, co. Limerick (Vote of Thanks).

Another seedling Apple was from Mr. Cooper Taber, Rivenhall, called Lady Rayleigh, but no award was made; and one called Captain Sanders, a seedling from Dumelow, shown by Messrs. Paul & Son, Cheshunt.

A silver-laced Savoy Seedling from Gilbert's Universal Savoy was sent by Mr. W. Carmichael, 14, Pitt Street, Edinburgh. The margins of all the leaves are cream coloured. Three green curled Savoys and three Improved Early Dwarf Cabbage were presented for Certificate by Mr. John Basbam, Fair Oak Gardens, Bassalee, near Newport, Monmouthshire, but no award was made.

A first-class collection of vegetables, showing rare selection and culture, was sent by Messrs. Sutton & Sons, Reading. There were nine dishes of Onions, including Sutton's Al Ailsa Craig, Sutton's Crimson Globe, Sutton's No. 40 and No. 30, all in capital condition; also Snowball Turnip, Autumn Mammoth Cauliflower, Sutton's Arctic Purple Kale, exceptionally fine; and Early Gem Carrot, short and very thick (Silver-gilt Knightian Medal).

Seedling Melons came from Mr. Owen Thomas, The Royal Gardens, Windsor, and from Mr. John Perkins, Thornham Hall Gardens, Eye.

A collection of Endive in half a dozen varieties was shown from the Royal Horticultural Society's Gardens at Chiswick.

Lecture on Onions.

In the afternoon a lecture on Onions was delivered by Mr. A. Dean, of Kingston. Mr. Dean commenced by giving authoritative opinions as to its native habitat, which it is believed to be Central Asia, afterwards touching upon all the various species of *Allium* that have been used in domestic economy, describing their nature, and the uses to which they are applied. The lecturer afterwards referred favourably to the Onion trials that have taken place at Chiswick this year, and afterwards described the different shapes; and as a further characteristic by which they may be classed, the colour of the skin was noticed, remarking that white-skinned varieties as a rule are bad keepers, and those with red skins are the best. The globular or spherical shape too was much better for this purpose than the flat ones. After remarking that the soil is not now made so hard and stiff for Onions, by batting it about as was once practised, Mr. Dean said that a fairly stiff soil was most suitable to them. The modern practice of growing large Onions for exhibition, was then described, of which the following is a *résumé*. Sow early in January in heat, and when large enough, transplant, or put into pots singly, and grow on in a little heat, but not excessive, until April, when they should be put out into soil in a sheltered border, that has been trenched and very heavily dressed. During the summer they must be mulched with manure, and fed also with liquid manure, and with chemicals. A good part of the remaining portion of the lecture was devoted to the subject of growing such large bulbs as is now the rage, the lecturer being strongly of opinion that no useful purpose is served by their production, and that they are of no value, except for exhibition, declaring that they were decidedly inferior in quality to those grown under ordinary treatment. In conclusion, the lecturer referred to the two most troublesome pests, the Onion-maggot and the Onion-mildew. After a few remarks by Mr. Cheal, who presided, the Rev. W. Wilks thanked the lecturer for taking such a decided stand against vegetables that had nothing to recommend them but mere size.

NATIONAL CHRYSANTHEMUM.

OCTOBER 25.—A meeting of the Floral Committee took place at the Royal Aquarium, Westminster, on the above date, Mr. George Gordon in the chair, a large number of varieties of Chrysanthemums being staged. First-class Certificates of Merit were awarded to Japanese Thomas Wilkins, chrome-yellow, a very fine reflexed Japanese, and to Mrs. Blair, a beautiful flower of the V. G. Drover type, but much more refined and highly promising, from Mr. R. Owen, Maidenhead. To Japanese Violetta, a beautiful soft blush-pink, reflexed flower, of first-rate properties, from Mr. E. Beckett, Elstree. To large-flowered Anemone Mdlle. Nathalie Brun, blush guard petals, with yellow cushions, a finely-formed flower of excellent quality, from Mr. Rowbottom, The Priory Gardens, Hornsey. To The Tribune, lemon-yellow, with deeper centre, extra fine, from Mr. H. J. Jones, Ryecroft Nursery, Lewisham. To yellow Lady Selborne, as a market and decorative variety, a bright yellow sport from Lady Selborne, which will be in great request for cutting purposes; a plant of medium height, in addition to boxes of cut blooms, being shown; from Messrs. Thomas Rochford & Son, Broxbourne. To Japanese Madame Camhon, a variety of the Comte de Germiny type, the broad incurved petals of a pale reddish colour, with a pale buff reverse; from Mr. C. Gibson, gr., Morden Park, Mitcham; and to Cactus Dahlia Cannell's Brilliant, bright reddish-crimson, distinct, and very fine. Among other fine varieties of Chrysanthemum, some of which narrowly escaped obtaining Certificates, and which the committee wished to see again, were Japanese Mrs. Charles Cox, a bronzy sport from Mons. Bernard, shown by Mr. Cox, Brickendon, Herts; Belle James, a large yellow Japanese, in the way of Sunflower, but not so long in the petals (Commended); from Mr. C. W. Knowles, Roehampton, Japanese W. Herbert Fowler, yellow; Rose Wynne, white; and Japanese Anemone Ada Strickland, bright buff-yellow, large and full, all from Mr. R. Owen. Japanese Dr. Gache, in the way of E. Molyneux, bright chestnut-crimson, with a golden-buff reverse, from Mr. E. Beckett; Japanese Madame M. Ricard, deep pink (Commended), from Mr. George Stevens, Putney; Japanese G. W. Childs, a very bright deep crimson reflexed Japanese from Mr. H. J. Jones; Japanese M. Aug. Lacvivier, in the way of G. C. Schwabe, from Messrs. H. Cannell & Son, Japanese Snows, a fine reflexed, crenmy-white flower, of decided promise; from Mr. Peters of Leatherhead, and Japanese Miss Strudwick, an orange-bronze sport from Margot, promising to make a very fine decorative variety. The committee expressed a wish to see a plant on a future occasion.

SCOTLAND.

NORTH OF SCOTLAND HORTICULTURAL AND ARBORICULTURAL ASSOCIATION.

THE members of this Association held their monthly meeting in the Christian Institute, Aberdeen, on Wednesday evening, 18th inst. There was a good attendance, and Mr. John Munro, Polmuir Nurseries, President of the Association, occupied the chair. The chairman thanked the members for the honour they had done him in electing him President, and in the course of an interesting address, urged upon the members to take a more active interest in the Association. He hoped the meetings would be well attended, and proceeded to give a number of hints which would enable them to strengthen their position as members of the Association. The Association, he said, should not be left to rely solely upon the individual efforts of its Fellows, but they should have a course of lectures on the scientific teaching of horticulture and arboriculture by an expert, and he was prepared to move a resolution to that effect. A course of lectures dealing with the theoretical and technical teaching of these subjects would prove a good investment, and would confer life-long advantages on the members. A short discussion followed the chairman's address, in the course of which his remarks were cordially endorsed. A vote of thanks was voted to the chairman for his address. Notes on the collecting and preparing of plants as dried specimens were then given by Mr. J. Duncan, and at the close he was thanked. There was on view in the hall a very fine display of fruit from Duffus House, Elgin.

THE ADVANCEMENT OF HORTICULTURE.

Most of the leading towns in the north have taken up the cause of advancing horticultural knowledge, and really one is brought more closely into touch with your leading article of October 14 as to the qualifications of gardeners of the present time. If we are to judge from most of the essays we hear read, and the able and lively discussions which follow them, in which foremen and journeymen gardeners take part, one may fairly say that the present generation of gardeners is certainly not behind its predecessors in practical knowledge; and though horticultural practice may have been weakened in some instances by change of methods and by the reduction of labour and means to keep the machinery of gardening going, we believe that at the present time there is more really good gardening than at any previous period of the history of horticulture.

Dundee has started well in the matter of a winter course of lectures, and has prepared, apart from the horticultural society's programme, a syllabus for a course of technical lectures on scientific and practical matters for the education of the young gardeners of the locality.

Aberdeen is a city never behind in good works, and is keeping well to the front in the matter of horticultural tuition, promising well for the future.

Edinburgh still goes on strongly with its well-organised system of disseminating knowledge for all classes and all ages among the horticultural fraternity, the horticultural association having arranged to give a course of scientific and practical lectures, as were so popular and widely taken advantage of last season. Mr. Robert Laird, the indefatigable secretary, has again taken this business part of the association in hand, and by his energy and well-organised arrangements he will, no doubt, bring it to a successful issue. Besides the scientific lectures given by highly qualified persons, there are subjects chosen for probationers especially, which are very essential to gardeners if they are to be useful members of the craft, and hold the best positions in the gardening world.

Glasgow.—We cannot ascertain what our friends in the Glasgow district are doing to advance horticulture. The town of St. Mungo is one of which the citizens are proud, and justly so, as no town in the kingdom is before the western capital of Scotland for practical workers in business philanthropic work, and for disseminating knowledge of wide and varied nature. Its shows of horticultural produce have never been surpassed in the north, especially for plants and vegetables; and the working men's institutions, where there are garden allotments, show how very creditably the workmen crop these, and what a capital feature they form of the philanthropic work of the city. But where is there any tangible proof in Glasgow or its suburbs that the interests of the young gardener are thought of as in other towns?

Stirling has done well in this direction, and one might expect as much at the home of the Drummonds. Falkirk started well this year, and what is most creditable, the best part of the work was performed by the young men themselves. The Chrysanthemums, cool Orchids, and root-pruning have been brought to the front in excellent form, each address calling forth keen and enthusiastic discussions. The questions put by some of the younger men are often original and pithy, but I must say they have not to thank many of the leading gardeners for their aid. *M. Temple, Carron House.*

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.

THE members of this Society held their annual meeting on Saturday, the 21st inst. There was a large attendance, over which Lieut.-Col. Crombie, Chairman of Directors presided. Although there was an unfavourable balance of £143 against the last show, the Society has still £557 to its credit. The report and balance-sheet was unanimously adopted after a brief discussion.

Mr. Jas. Dalgarno then moved "That Rule IV. of the general rules read as follows:—The affairs of the Society shall be under the management of the acting directors, consisting of a chairman, vice-chairman, and sixteen members (seven of which shall form a quorum), who shall be elected at the general meeting. Several members spoke in support of the motion, and urged that the Society had failed in a measure to carry the object for which it existed, and deprecated the practice which has latterly obtained of associating their exhibitions, with cavalry sports, balloon ascents, and other amusements, which brought in much money, but dwarfed the horticultural

tural interest.' In the end the motion was defeated by forty-one votes to four.

The election of officers was then proceeded with, and Sir Arthur Grant, Bart., of Moynusk, was elected chairman, in the room of Lieut.-Colonel Crombie, resigned; and Mr. A. Robson vice-chairman. Several alterations were made in the directorate, and Mr. A. M. Byres was re-elected Secretary and Treasurer. Votes of thanks were accorded to the retiring chairman and other officers.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

LAVANDULA SPICA.—Will some of your correspondents kindly inform H. C. P. if this plant is grown in large quantities in England for the manufacture of Lavender-water? If so, where, and what the conditions are under which it is so cultivated.

MALE AND FEMALE SWANS.—G. P. would be glad if some correspondent would kindly inform him, through our columns, if there are any signs in plumage, head, bill, &c., by which the female may be distinguished from the male bird, and at what age the female begins to lay.

Obituary.

WILLIAM ALLITT.—We regret to have to record the death of Mr. William Allitt, of the Tyrendarra Nursery, Victoria. The deceased was a native of co. Kerry, came to Portland, Victoria, to take charge of the Portland Botanical Gardens, which he laid out and managed with credit to himself and the town for a number of years. He then went to Tyrendarra, where he founded the nursery at that place. His knowledge of the science of botany was very extensive, and he was a regular correspondent with Baron Von Mueller, who held the deceased in much esteem as a co-enthusiast in the search after the beautiful in Nature. Mr. Allitt was made a Fellow of the Royal Horticultural Society. The Styphelia Allitti was named after this estimable man.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.	BRIGHT SUN.

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—
- 1, Scotland, E.; 2, England, N.E.; 3, England, E.;
- 4, Midland Counties; 5, England, including London, S.
- Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending October 21, is furnished from the Meteorological Office:—

"The weather during this period varied considerably. In the extreme west and north small amounts of rain fell almost daily, but in the more southern and eastern districts, rain fell only on the first few days, and again at the end of the week, the intervening days being fine and bright.

"The temperature was much above the mean, the excess ranging from 5° in 'Scotland, N.' on the one hand, and 'England, S.W.,' 'Ireland, S.,' and the 'Channel Islands' on the other, to 7° in 'Scotland, E.,' 'England, E.,' and the 'Midland Counties.' The highest of the maxima were recorded, as a rule, either on the 16th or 21st, when they varied from 70° in 'England, N.W.,' and from between 66° and 69° in most of the other districts, to 61° in 'Scotland, W.,' and 60° in 'Scotland, N.' The lowest of the minima were recorded on the 19th, and ranged from 31° over 'England, S.W.' and 'Ireland, N.,' to 40° in 'England, N.W.,' and to 45° in the 'Channel Islands.' During the earlier half of the week the nightly minima were very high for the time of year.

"The rainfall slightly exceeded the mean in 'Scotland, N. and Ireland, S.,' and just equalled it in 'England, S.,' in all other districts there was a deficit. In 'England, N.E.,' and also in the 'Channel Islands,' the aggregate fall amounted to only one-tenth of an inch.

"The bright sunshine was (excepting in the Channel Islands) less prevalent than of late, the percentage of the possible duration ranging from 7 in 'England N.W.,' and 8 in 'Scotland, N.,' to 15 in the Irish districts, to 29 in 'England, E. and England, S.W.,' and to 30 in 'England, S.' In the 'Channel Islands,' however, the percentage was as high as 46."

MARKETS.

COVENT GARDEN, October 26.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

Prices rule as last week.

POTATOS.

Arrivals are very heavy, and trade slow, prices rule very low, except for best samples. Best Beauties making 100s. to 120s.; Abundance, Bruce, 80s. to 90s.; other kinds, 42s. 6d. to 60s. J. B. Thomas.

SEEDS.

LONDON: Oct. 25.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market thinly attended, with little business doing. American quotations for Clover seed are cabled weaker. The English sowing demand for Trifolium seems about over. Winter Tares realise last week's rates; supplies appear nearly exhausted. Rye keeps firm. For Canary seed, the consumptive demand improves; stocks in the hands of dealers are at a very low ebb. Hemp seed is steady. Blue Peas and Haricot Beans are held on former terms. Linseed is quieter. There is no change in either Mustard or Rape seed.

FRUITS AND VEGETABLES.

BOROUGH: October 24.—Quotations:—Cabbages, 3s. to 6s.; Savoys, 4s. to 6s.; Cauliflowers, 4s. to 5s. per tally; Turnips, 1s. 6d. to 2s. 6d.; Carrots, 2s. to 3s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 5s. to 6s. 6d. per bag; Apples, 2s. to 8s. per bushel.

SPITALFIELDS: October 24.—Quotations:—Cabbages, 3s. to 6s.; Savoys, 5s. to 6s.; Cauliflowers, 4s. to 5s. per tally; Turnips, 1s. 6d. to 2s. 6d.; Carrots, 2s. to 3s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 5s. to 5s. 6d. per bag; Apples, 2s. to 8s. per bushel.

FARRINGTON: October 25.—Quotations:—Savoys, 4s. to 6s.; Cabbages, 3s. to 6s.; Cauliflowers, 4s. to 5s. per tally; Carrots, 2s. to 3s.; Turnips, 1s. 6d. to 2s. 6d.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 5s. to 6s. 6d. per bag.

FARRINGTON: October 26.—Quotations:—Apples, 2s. 6d. to 3s. 6d. per bushel; do., Blenheim, 4s. per bushel; Grapes, Almeira, 9s. 6d. to 11s. per basket; Tomatoes, 6d. per lb.; Horseradish, 1s. 3d. per bunch; Celery, 1s. per roll; pickling Cabbages, 1s. 3d. per dozen.

STRATFORD: Oct. 24.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done as under:—Cabbages, 2s. to 5s. per tally; Savoys, 3s. to 6s. per tally; Cauliflowers, 1s. to 1s. 6d. per dozen; do., 3s. to 5s. 6d. per tally; Turnips, 1s. to 1s. 6d. per dozen bunches; do., 30s. to 40s. per ton; Carrots, household, 45s. to 55s. per ton; cattle-feeding, 32s. to 40s. per ton; Parsnips, 50s. to 60s. per ton; Mangels, 24s. to 27s. per ton; Swedes, 26s. to 28s. per ton; Onions, English, 7s. to 8s. per bag; Dutch, 5s. 6d. to 6s. per bag; Belgian, 5s. 9d. to 6s. 6d. per case; Apples, English, 2s. to 3s. per bushel; Horseradish, 1s. 4d. to 1s. 6d. per bundle; Sprouts, 2s. to 2s. 2d. per half-sieve; Celery, 8d. to 1s. 2d. per roll.

POTATOS.

BOROUGH AND SPITALFIELDS: October 24.—Quotations ranged between 40s. and 110s. per ton.

STRATFORD: October 24.—Quotations:—Magnums, dark-land 40s. to 45s.; light do., 50s. to 70s.; Hebrons, 60s. to 70s.; St. Albans, 60s. to 70s. per ton.

FARRINGTON: October 26.—Quotations:—Hebrons, 80s. to 100s.; Magnums, 40s. to 60s.; Champions, 45s. to 60s.; Regents, 50s. to 70s.; Black-lands, 45s. to 55s. per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 140s. to 158s.; new, do., 125s. to 145s.; inferior, do., 100s. to 120s.; Hay, best, 145s. to 170s.; inferior, do., 90s. to 100s. New Mixture, 115s. to 130s.; and Straw, 35s. to 56s. per load.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending October 21, and for the corresponding period last year:—1893: Wheat, 27s. 6d.; Barley, 29s. 6d.; Oats, 18s. 1d. 1892: Wheat, 23s. 7d.; Barley, 27s. 9d.; Oats, 17s. 11d.

BOOKS: *A. B. Strawberries*, by W. H. Harrison, Shrewsbury. Published by Simpkin, Marshall, Hamilton, Kent & Co., London, price 1s.—*B. A. C. Artistic Flower Decoration*, by B. C. Saward. The Bazaar Office, 170, Strand, W.C.

BULBOUS PLANT: *A. J. S.* The plant purchased in Paris as *Scilla maritima*, and said to be an Indian Water-plant, is probably *Paneratium maritimum*, a species common in the Mediterranean region. It is hardy in this country, and is amenable to cold frame or greenhouse culture. For pot-culture, the soil may be sandy loam in a roughish state, to which some well-decayed manure may be added. It should not have a pot more than 2 inches in diameter, wider than the bulb, be firmly potted, two-thirds of the bulb below the surface, and well watered when in full growth.

CALANTRES: *B. Wadds.* These plants will be alluded to by Mr. Holmes in his Calendar.

CARNATIONS DISEASED: *Helva.* The plants sent which have light brown circular spots on the leaves, are attacked by the fungus *Helminthosporium echinulatum*. The other plant is similarly attacked, and has the Carnation rust (*Septoria dianthi*) as well. You had better destroy by burning all the affected plants.—*One Anxious to Know and Constant Reader.* *Septoria dianthi*.

COLOURING FLOWERS ARTIFICIALLY: *W. H.* This is sometimes done with Lilies, Carnations, Hydrangeas, &c., either by growing the plants in soil mixed with the colour-inducing substances, or putting the cut flowers in water containing colouring matter, which they then absorb. Nothing more has, we believe, been published about the matter than will be found scattered through the various journals of the day.

COUNTY COUNCIL LECTURERS: *F. A. G.* The salary paid by the different councils varies considerably; some being paid a certain sum annually, and others are engaged for a season at so much per lecture; and some lecturers would have a good deal of travelling about and many meetings to attend, whilst others, in sparsely peopled districts, would have but little to do in comparison.

CYPRIPEDIUM INSIGNE: *A. C.* The production of twin flowers is not very unusual.

DRESSING FOR FRUIT-TREE STEMS TO PREVENT RABBITS AND HARES NIBBLING THEM: *Subscriber.* A paint consisting of cow-dung, clay, soot, with a wineglassful of spirits of tar to one bucketful. Make it rather thick, and smear it on the stems to a height of at least 5 feet. It is not unightly when dry, and does no harm, rather good, as mossiness is killed by it. Two dressings will usually last a season. If this paint be objectionable, put rabbit-proof wire, or branches of Thorns fastened closely round the stems by means of wire; or make a loose cradle of straight rods three-quarters of an inch in diameter, with a half-inch separating-block in each space, and thread the whole on pieces of wire at the top and bottom. This last is a good kind of defence against stock of all kinds, and as it will slip round the stem when the animals rub against it, they soon learn to let it alone.

GRAPES NOT KEEPING WELL: *J. M.* The fruit having been ripe in August cannot be expected to keep for any great length of time; and owing to a dryish buoyant air not being maintained in theinery during the late damp and rainy weather, decay of the berries has set in. The only remedies are to apply a little fire-heat and to admit a small amount of air at the same time, or to cut the bunches with a portion of the shoot attached to each, and bottle them. When bottled, they will keep in a dry, cool room, if means be adopted to let out the moisture that will arise from the water in the bottles and the fruit itself.

INSECTS: *G. C.* Black aphid. Use tobacco-water.—*J. Challis.* The minute creatures sent are not beetles, but small black Acari, probably immature. It is scarcely likely that they are in any way connected with the Cattle-fly. *R. McL.*

LECTURE ON THE GENUS HYDRANGEA: *J. B. Knowling,*

as you tell us, nothing whatever about the subject you are going to give a lecture upon, we are surprised at your making the attempt. Consult the ordinary text books.

NAMES OF FRUITS: *A. Jackson.* Apple: Hawthorned. Pears: 1, Pitmaaston Duchess; 2, Duchesse d'Angoulême; 3, Grosse Calebasse; 4 and 5, Beurré Diel.—*Simmonds.* 1, Mère de Ménage; 2, Cellini; 3, Round Winter Nonanch; 4, Alfriston; 5, Beauty of Kent; 6, Gloria Mandi.—*J. Day.* Apple Dutch Codlin, Pear Beurré Gria.—*F. S. I.* Easter Beurré; 2, Old Bergamot; 3, Vicar of Winkfield; 4, Winter Nelia; 5, White Doyenné; 6, Old Nonpareil.—*J. F. I.* Emille d'Hégest; 2, Durondeau; 3, Beurré Superfin; 5, Napoléon; 4 and 6, rotten.—*A. Y. I.* Marie Louise d'Uccle; 2, White Doyenné.—*J. L. PRUNING MADE SAFE AND EASY!

THE STANDARD MANUFACTURING CO., DERBY, beg to announce that they have just completed several valuable improvements and additions to their already world-renowned series of Pruning and Horticultural Appliances. One is styled the "FULCRA" Tree Pruner, which is capable of cutting a branch midway between the sizes that the "Standard" and Giant Tree Pruners will cut, and with the same ease and efficiency. Another is arranged to work with a spring and cord, enabling it to be in jointed sections any reasonable length. It can also be supplied without pole, an advantage if required for export. Our new Patent Combined Branch and Vine Pruner and Trimmer and Fruit Gatherer commends itself for being instantly adjustable for the double purpose. Also the new Patent "Easy" Weed Destroyer, for applying weed-killing compounds without stooping or soiling the hands. Illustrated Price LISTS of the above, and our other well-known Specialties in Pruning and Gardening Appliances, will be sent post-free by us or our Agents—the Principal Ironmongers and Seedsmen, the leading Stores, and kindred trades at home and abroad.

THE IMPROVED GARDEN GULLY
(VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d.

(The larger sizes are very strong for carriage drives.) Full Particulars and Testimonials on application.

FOREMAN (GENERAL, or Plant and Fruit); age 24.—GEO. ABBEY, Avery Hill, Eltham, Kent, can highly recommend W. Bishop. Eleven years' experience in first-class situations, including two here.

FOREMAN (GENERAL).—Age 27; thirteen years' experience; highest references as to character and ability.—H. PICKSTOCK, Moxhull Hall, Erdington, Birmingham.

FOREMAN (FIRST), Journeyman in good establishment; age 25; ten years' experience.—Mr. EBBUTT, Drakelowe Gardens, Barton-on-Trent, can with confidence recommend J. Grix as above.

FOREMAN (Inside or General).—Age 26; two years in previous situation as Foreman. Thirteen years' experience in Fruit, Stove, and Greenhouse Plants, Orchids, and general work.—J. HYGATE, Brighton Cottage, Handovers, Crawley, Sussex.

FOREMAN (good GENERAL).—Age 26; ten years' experience. Good Plant and Fruit Grower. Good character and testimonials. Disengaged.—W. H. WATERS, Dane's Lane, Keynsham, near Bristol.

JOURNEYMAN, in either Plants or Fruit, or in the Houses; age 20.—Mr. JONES, until lately Gardener at Sutton Hall, Yorks, would be pleased to recommend J. SMALES, who has been with him two years, as above.—J. SMALES, Campbell Terrace, Easington Lane, Fencehouses, Durham.

JOURNEYMAN (Inside, or Inside and Out).—Age 22; six years' experience. Good character.—C. COLMER, Bassett Green, near Southampton.

JOURNEYMAN (Inside and Out), under a Foreman.—Age 23; seven years' experience. Good character from present employer. Bothy preferred.—W. LEVETT, Benhall Lodge, Saxmundham, Suffolk.

JOURNEYMAN, Inside, under a Foreman.—Age 20; six years' experience. Good references.—A. HOBBS, The Gardens, Langford House, Lechlade.

JOURNEYMAN, Inside.—Age 19; has had seven years' experience in large establishments. Good characters. Bothy preferred.—A. B., 4, Temple Bar, Cosham, Hants.

JOURNEYMAN, Inside, under a FOREMAN.—Age 23; eight years' experience. Bothy preferred.—F. BOURNE, Lindley Hall Gardens, Nuneaton.

JOURNEYMAN or FOREMAN.—Age 25. Eight years' experience; three years present situation; good character.—W. BARRETT, Moreton, Bideford, N. Devon.

JOURNEYMAN, in the Houses.—Age 20. Five years' experience; good character.—A. WINGROVE, Rousham Park, Steeple Aston, Oxon.

JOURNEYMAN, under a good Foreman.—Age 25; four years' experience.—T. E. CLIFFORD, Lindley Hall Gardens, Nuneaton, Warwickshire.

JOURNEYMAN (FIRST), under a Foreman.—Age 22; six years' experience. Excellent characters from present and previous employers. WILLIAM HUTCHINGS, Oakley Hall Gardens, Basingstoke.

JOURNEYMAN, Inside or Out.—Age 23; nine years' experience. Good reference.—W. E. SMITH, 84, High Street, Sydenham, S.E.

JOURNEYMAN (Inside); age 23; eight and a half years' experience.—Mr. J. WHITE, The Gardens, Harefield Grove, Uxbridge, Middlesex, can with confidence recommend George Simmonds as above.

JOURNEYMAN (Inside, or Out).—Age 18; three years' experience. Total abstainer. Can have good character.—H. STOPPS, Church Street, Woking Village.

JOURNEYMAN (SECOND).—Age 20; two years in a good establishment, and some Nursery experience. Strong and healthy. Bothy preferred. Good character.—GARDENER, Cookham Rise, near Maidenhead.

IMPROVER or JOURNEYMAN.—Young Man (age 19), seeks a situation as above. Six years' experience. Good reference.—H. KNOTT, Gardens, Ashfield House, Branston, Lincoln.

ASSISTANT (JUNIOR), or IMPROVER.—A young man (age 20), who has been with a Seedsman and Nurseryman, wants re-engagement in the Retail Seed and Bulb Department as above. Present situation three years. Good character.—E. JENNINGS, 4, New Buildings, Tenter Street, Aldgate, E.

TO RELIABLE SEED FIRMS, North Wales, Cheshire, and Shropshire. An energetic Seedsman of good address is open to communicate with a good Firm, with a view of his representing and augmenting Business in the above Districts. Speaks excellent English and good Welsh. Highest references.—Apply, W. T. H., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

MESSRS. PITCHER and MANDA have great pleasure to recommend their TRAVELLER, Mr. S. JOHNSON, who has been representing them in Great Britain for over two years, and can give the best of testimonials, and can strongly recommend him to anyone requiring his services. He is now leaving us on account of our giving up the European Branch at Hextable.—S. JOHNSON, Gloucester Place, Windsor.

TO HORTICULTURISTS.—Advertiser seeks engagement in a large Horticultural Business, where he could gain experience. Would be willing to give time if necessary.—For particulars, apply to A., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO GARDENERS.—Situation wanted by a youth (age 18) under a good Gardener. Steady and industrious, willing to be useful. Abstainer. Good character from last employer.—J. BREACH, Prior's Court Lodge, near Newbury, Berks.

TO GARDENERS.—A young Man seeks a situation as IMPROVER or JOURNEYMAN (age 19). Four years' experience.—Address R.S., Ivy Cottage, Osbastone, Huncley.

TO GARDENERS, &c.—Situation required by Young Man (age 23), abstainer and non-smoker. Slight experience. Good character.—W. F., 2, Sherwood Villas, Roxeth, Harrow.

TO GARDENERS.—J. S. UPEN, Wiggan-thorpe, York, wishes to recommend a strong youth (age 19) for the Garden. Four years' experience, Inside and Out. Yorkshire preferred.

TO GARDENERS.—Situation wanted for a Lad (age 16) in the Garden; strong and active; Gardener's son.—G. PERKINS, Arthingworth, Northampton.

TO NURSERYMEN, &c.—A young Man seeks re-engagement Indoors. Six years' experience in London Market Nurseries; two years last situation. Highly recommended.—BROWN, 6, Queen's Road, Wickham Lane, Welling Kent.

TO NURSERYMEN.—Situation required by a young man as IMPROVER, in good Nursery. Good Salesman. Can be well recommended. Good character.—G. T., 22, Avenue Road, Mill Hill Park, Acton.

TO NURSERYMEN.—Young Man (age 20) seeks a situation in a Nursery, under Glass; five years' experience.—S. H. P., Belvedere, Lower Caversham, Oxon.

MR. J. F. McLEOD, Dover House Gardens, Rochester, can strongly recommend to any Gardener, Lady, or Gentleman, a man (middle-aged) to attend to Cows, and fill up time in Garden; married, no family.

SALESMAN or GROWER.—Age 28; good experience of Palms, Ferns, &c., or could manage branch business. First-class references.—W. B., 11, Knightsbridge Green, S.W.

To Nurserymen and Florists.

SALESMAN, or FURNISHER.—Age 27. Good experience of West End, and not afraid of work. First-class references.—W., 33, Brookville Road, Fulham, S.W.

SHOPMAN; age 22; Swiss.—Situation wanted as above; speaks French, German, and English. Good references.—A. Z., 107, Charlotte Street, Fitzroy Sq., W.

TRAVELLER or MANAGER.—S. JOHNSON would be glad to represent any good house having large General Stock to offer. Well-known on the road, both to the Trade and privately. Last two years for Messrs. Pitcher & Manda; leaving through their giving up their European Branch.—Gloucester Place, Windsor.

FARM BAILIFF, or Position of Trust.—A Cumberland Man wants a situation as above. Understands Breeding and Rearing of all Farm Stock; also Buying and Selling of same. Good references.—J. B., 8, Croxteth Grove, Liverpool.

HANDY MAN, on a large Estate.—Can Paint, Glaze, and do Carpentering, or any kind of work.—Age 32, married. Seven years' good character from Mr. J. BROWN, Great Doods, Reigate.

CLERK, who is experienced in the Nursery and Seed Office-work, seeks re-engagement. Good references.—H., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SEED TRADE.—Situation wanted as SHOPMAN, or ASSISTANT. Seven years' experience in two good Houses. Age 21.—SEEDSMAN, 35, Waterway Street West, Nottingham.

THE DISSOLUTION OF THE HOUSE OF LORDS has often been predicted by politicians, who generally speak according to their own desires. It is difficult to uproot old institutions in England, especially when they are associated with the rights of the people. It is well-known that there must be a check upon the action of our legislators, or their authority would soon become too autocratic to be consistent with our liberties. The Government must be thoroughly representative of all classes, if the spirit and letter of its creation is to be upheld. Putting aside politics, however, Holloway's Pills and Ointment have been a boon to rich and poor alike for over fifty years, as the best remedies for all diseases.

FOSTER & PEARSON, Lmtd., 22 FIRST PRIZES.

Established 1841.

BEESTON, NOTTS.

IMPROVED SPAN FRAMES.

The Lights are held open for Ventilation or Watering without props, and can readily be removed if necessary. Top Ventilation by Lantern.

PLEASE SEND FOR PRICE LISTS.

THESE FRAMES SHOULD BE IN EVERY GARDEN.

HUNDREDS SOLD.

ESTIMATES FOR

Vineries, Orchid Houses,
Peach Cases,
Plant Houses, Frames, &c.,
ON APPLICATION.

ONLY THOROUGHLY SEASONED TIMBER AND BEST WORKMANSHIP EMPLOYED, THUS ENSURING DURABILITY & REAL ECONOMY.

CHARLES P. KINNELL & CO.,

IRONFOUNDERS, ENGINEERS, and BOILER-MAKERS.

ROCHFORD HORIZONTAL TUBULAR BOILER,

BOLTING TOGETHER WITH INDIA-RUBBER RING-JOINT, MANUFACTURED WITH FLOW AND RETURN SOCKETS IN ANY POSITION.

This Boiler has special advantages over any other of this type manufactured; the configuration of the centre casting divides the top connecting-pipe into two sections, gives increased waterway, and is removable without taking off back casting. No other Boiler has this advantage.

TERMINAL END AND CHAMBERED SADDLE BOILER.

VERY HIGHLY RECOMMENDED.

Terminal End and Flued Saddle.

This Boiler is of the IMPROVED SADDLE FORM, is manufactured in Wrought Iron, welded; the back waterway, against which full force of the fire strikes, and the centre flue, make this one of the most economical Boilers extant. Made in all sizes, from 24 to 72 in. long.

CAST-IRON SADDLE BOILER,

WITH WATER-WAY END And CENTRE-FLUE.

The above is the best of all Boilers of the plain Saddle type. Made in all sizes, from 24 to 66 inches long.

Holding one of the largest stocks of H. W. Boilers, Pipes, and Fittings, in the Kingdom, we are able to execute Orders of any magnitude from London Warehouses, or to despatch direct from Works without delay. To meet the requirements of our increasing business, we have recently added No. 65, Southwark Street to our London premises, and have now the largest and finest Show-rooms in our Trade in the Kingdom. Price List illustrating all types of Boilers, Valves, Pipes, Ventilating Gear, and all classes of Horticultural Appliances free on application.

SILVER MEDAL HORSE-SHOE BOILER,

The Best and Most Economical Amateurs' Boiler Manufactured.

Section of Boiler and Pipes, showing action of Hot Blast and Automatic Regulator. Awarded the SILVER MEDAL (FIRST PRIZE) by the Royal Horticultural Society in 1883; still stands without rival for—

Power, Efficiency, and Economy.

65 and 65a, SOUTHWARK STREET, LONDON, S.E.; also Branches at GUERNSEY and JERSEY, for CHANNEL ISLANDS.

N.B.—There will be no Sales of Bulbs or Plants on Thursday next in the Sale Room, in consequence of the Lord Mayor's Show.

Cliffe, near Rochester.
SECOND PORTION of Mr. Horne's Immense STOCK.—
 IMPORTANT TO FRUIT GROWERS, MARKET GARDENERS, and OTHERS.

MESSRS. PROTHEROE and MORRIS have received instructions to hold a CLEARANCE SALE by AUCTION, of 50,000 FRUIT TREES, on the premises, Perry Hill, Cliffe, near Rochester, on MONDAY, November 20, at half-past 11 o'clock.

Friday, November 10.

GREAT SALE of ORCHIDS.

The New **DENDROBIUM IMPERATRIX**, Kränzlin.
 The New **DENDROBIUM VARATRI-FOLIUM**, Lindley.
 The New **ONCIDIUM SANDERIANUM**, Rolfe.
 The New **BULBOPHYLLUM ERICSONII**, Kränzlin.
 The New **MESOSPINDIUM GRANDIFLORUM**.

MESSRS. PROTHEROE and MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Chapside, London, E.C., on FRIDAY NEXT, November 10, at half-past 12 o'clock, by order of F. Sander & Co., magnificent importations of the new and remarkable

DENDROBIUM IMPERATRIX, a wonderfully free-flowering species, the spikes being furnished from beginning to end with a wealth of lovely blooms. Sepals light rose, lip pure white, with large petals of a purple tint, and striking appearance, like lawn-tennis rackets with long handles, standing erect.

DENDROBIUM VERATRI-FOLIUM, Lindley, now introduced for the first time. Flowers large, and pure white.

ONCIDIUM SANDERIANUM, Rolfe, a grand new discovery, allied to the macrantha section. Petals rich brownish-red with golden margins; sepals self-coloured; flowers 4 inches in diameter, and borne in profusion. The finest Oncidium discovered of late years.

PERISTERIA ASPERSA, Rolfe, and varieties aurantiaca, purpurea, atro sanguinea, &c. A magnificent and free-flowering species, abounding in novel and beautiful shades of colour.

BULBOPHYLLUM ERICSONII, Kränzlin, an entirely new and splendid species, and the finest of the genus. Dr. Kränzlin says, *Gardeners' Chronicle*, October 28, 1893:—"Imagine a group of nine to twelve flowers, of a large chimaeroid Masdevallia, surmounting a slender flower-stalk, and you will get an idea of this extraordinary new Bulbophyllum."

MESOSPINDIUM GRANDIFLORUM, a splendid new variety, the most charming of cool-house Orchids, brightest in colour, and boldest in form of the entire section.

ONCIDIUM HASTIFERUM, the brilliantly-coloured, large-flowered, short-spiked variety of *O. macranthum*.

ONCIDIUM AUROSUM SPLENDENS Lovely golden-yellow and red-banded blossoms, borne in great abundance. This might well be called the majus form of this splendid Oncid.

ODONTOGLOSSUM or ONCIDIUM SP. A new and colossal-bulbed species.

DENDROBIUM PHALANOPSIS SCHRODERIANUM.
 THE KING OF THE GENUS.

Universally acknowledged to be the most superb Orchid yet introduced. Its range of colour is prodigious, from pure white to deepest crimson.

A fine importation of **ODONTOGLOSSUM HYSTRIX**.
NEW ONCIDIUMS, NEW ODONTOGLOSSUMS, NEW LYCASTES.

ANGULOA CLOWESII ALBA.
 The rare and beautiful pure white **CRADLE ORCHID**, &c.
 Also ten lots of a **NEW LELIA** in FLOWER (another property), and a pair of **WHITE JACKDAWS**, from South Tyrol.

On view morning of Sale, and Catalogues had.

Monday Next.

PLANTS FROM BELGIUM, ROSES, &c.
 100 **AZALEA INDICA**, 100 **A. MOLLIS**, 50 hardy Ghent **AZALEAS**, 50 **CAMELLIAS**, 50 **RHODODENDRONS** received direct from Belgium, 100 **STANDARD ROSES**, fine clean straight stems, good bushy heads to name; 200 **CYCLAMEN PERSICUM** in thumbs, 160 **LILIUM ALBUM KRATZERI**, English grown roots, 40 lots of well-grown Greenhouse Plants and Ferns, and 100 lots of hardy Bulbs and Plants.

MESSRS. PROTHEROE and MORRIS will SELL the above by AUCTION at their Central Sale Rooms, 67 & 68, Chapside, London, E.C., on Monday next, November 6, at 12 o'clock.

On view morning of Sale, and Catalogues had.

Wednesday Next.

250 **AZALEA INDICA**, named sorts; 350 **A. MOLLIS**, 36 **RHODODENDRONS**, 36 **DRACENAS**, 24 **ASPIDISTRAS**, direct from Belgium; 150 lots of specially fine English-grown **LILIES**; 1000 very fine English-grown bulbs of **NARCISSUS**, Emperor and Empress; a quantity of **PALM SEEDS**, 150 **LATANIA BORBONICA**, **CORYPHA AUSTRALIS**, **DRACENA AUSTRALIS**, 15,000 **GALANTHUS ELWESII**, first-size bulbs, in splendid condition; 2000 **LILIUM CANDIDUM**, 3000 **CHIONODOXA LUCILLE**, **STOVE** and **GREENHOUSE PLANTS**, &c.

MESSRS. PROTHEROE and MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Chapside, London, E.C., on WEDNESDAY NEXT, November 8, at 12 o'clock.

On view morning of Sale, and Catalogues had.

Saturday Next.

SPECIAL SALE OF DUTCH BULBS.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on SATURDAY NEXT, an importation of choice **DUTCH BULBS**, specially lotted for all buyers.

On view morning of Sale, and Catalogues had.

SPLENDID BULBS FROM HOLLAND.

Sales every **MONDAY, WEDNESDAY, THURSDAY**, and frequently on **SATURDAY**.

In Large and Small Lots, to suit all buyers.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., first-class consignments of choice **HYACINTHS, TULIPS, CROCUS, NARCISSUS**, and other **BULBS**, arriving daily from well-known farms in Holland to the finest possible condition.

On view mornings of Sale, and Catalogues had free on application.

N.B.—None but good and reliable Bulbs will be offered.

Wednesday Next.

300 Choice named Standard and Dwarf **ROSES**, Collection of **BORDER PLANTS**, 50,000 Best Berlin **LILY OF THE VALLEY** Crowns, 1000 Clumps of ditto, 3000 **SPIRÆAS**, 3000 **LILIUM HARRISII**, **AZALEAS** from Ghent, **CHRISTMAS ROSES**, &c.

MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, November 8.

On view morning of Sale, and Catalogues had.

NEW ILLUSTRATED LIST Now Ready.

IMPORTANT.

I RESPECTFULLY beg to inform all readers of this Paper that the first edition (100,000 copies) of my Revised PRICE LIST, consisting of 400 Pages and about 1200 Illustrations, bound in cloth, is Now Ready. I shall have much pleasure in forwarding, in due course, to every person who has applied for a Price List up to Oct. 28 of this year, one post-free; and to all persons until Nov. 26 sending Three Stamps for postage, after which the price will be One Shilling each, Post-free. This List is the most Complete in the trade, and has cost several thousand pounds to produce.

P.S.—Persons who have applied for a List at any time during the year, need not write again, as I have names and addresses, and one shall be sent in due course.

CONTENTS OF SECTIONS.

SECTION.	PAGES.
I. CONSERVATORIES, GREENHOUSES, VINERIES, ORCHID HOUSES, PLANT AND FORCING HOUSES, FRAMES, PITS, HAND-LIGHTS, &c.	17-64
II. POULTRY, KENNEL, RABBIT, AND PIGEON APPLIANCES, &c.	65-98
III. RUSTIC WORK	99-134
IV. IRON BUILDINGS AND ROOFING, CHURCH FURNITURE, &c.	135-178
V. HEATING APPARATUS, COOKING STOVES, &c.	179-228
VI. HORTICULTURAL MANURES, FERTILIZERS, INSECTICIDES, WORM AND WEED DESTROYERS, SUNSHADES, SOILS, &c.	229-246
VII. LAWN MOWERS AND EDGE CUTTERS, TENNIS MARKERS, GARDEN ROLLERS, &c.	247-268
VIII. HORTICULTURAL TIMBER	269-280
IX. HORTICULTURAL SUNDRIES, WIREWORK, FOUNTAINS, VASES, STATUARY, &c.	281-342
X. VEGETABLE AND FLOWER SEEDS, PLANTS, DUTCH BULBS, &c.	343-383

WHY CAN W. COOPER SELL HIS GREENHOUSES, &c., CHEAPER THAN OTHER MAKERS?

- I. Because he imports Timber in large quantities, and with the aid of special constructed machinery converts it into various shapes and sizes required for horticultural work himself on the premises, which no other horticultural builder is in a position to do. Can any timber merchant supply you with timber at anything near his prices? If any doubt, get estimates.
 - II. Because he imports Glass in large quantities, and has an agent who does nothing else but call on the manufacturers and buys up all parcels, large or small, at reasonable prices. Can any glass merchant supply you on better terms than him? If any doubt, get estimates.
 - III. Because he has an Iron Foundry in the iron district and casts nothing else but his own boilers and pipes all the year round, and by this means can sell cheaper than any other firms who go in for all kinds of castings. Can you buy a boiler or complete heating-apparatus at anything near the price he quotes? If any doubt, get estimates.
- You will see by the above that everything is bought direct in the cheapest markets, thus saving middleman's profits, and not having to go to the timber merchant for the timber, the glass merchant for the glass, and the foundry for heating apparatus, like other horticultural builders. Buy of the Original Inventor of Cheap Greenhouses. Do not pay 5 or 6 profits, but one only.

Deduct 10 per cent. if required for brickwork.

THESE GREENHOUSES ARE MADE especially for Amateurs at a nominal figure, thereby coming within the reach of those who require a strong but inexpensive structure, and being constructed in complete sections, can be readily erected by any handy man or gardener in a few hours. The framework is substantially constructed of red deal, the lower part being filled in with good, sound, well-seasoned, tongued and grooved matchboards. The houses are fitted with door complete, with rim lock and brass furniture, painted one coat of good oil colour, supplied with all necessary iron-work and stages for each side, and good 16oz. glass throughout. All parts securely packed, and put on rail; or delivered, erected, and glazed complete, within twenty miles of London Bridge, at the prices mentioned on each side.

ILLUSTRATED LIST POST-FREE. GLASS FREE ON RAIL IN LONDON.

"INVINCIBLE" HOT-WATER APPARATUS.

MOST EFFICIENT AND CHEAPEST IN EXISTENCE.
 Made in six sizes: No. 1, to drive 75ft., £1 15s.; No. 2, 10 ft., £1; No. 3, 200ft., £3 10s.; No. 4, 275ft., £7 10s.; No. 5, 375ft., £8 10s.; No. 6, 500ft., £10; of 4in. pipes.

Requires no sunk stovehole and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed. Cost of complete Apparatus for Greenhouses, with 4-inch pipes, flow and return along one side cut and fitted; so that if the internal measurement of the Greenhouse is given, the Apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all. Securely and carefully packed on rail at the following respective prices:— 7ft. by 5ft., £2 15s.; 9ft. by 6ft., £3; 10ft. by 7ft., £3; 12ft. by 8ft., £3 5s.; 15ft. by 10ft., £4 5s.; 20ft. by 10ft., £5 5s.; 25ft. by 10ft., £6 5s.

 And BARNET, HERTS.

AN UNPARALLELED PURCHASE! ENORMOUS ACQUISITION OF AMERICAN SEEDLINGS.

THERE have been many interesting and important events in the history of the Chrysanthemum, but it may confidently be asserted, without the slightest fear of contradiction, that the event which I am enabled to announce in the present paragraph is unique for its magnitude and its bearing upon Chrysanthemum cultivation at large. Messrs. PITCHER and MANDA, the eminent American nurserymen, who have been instrumental in introducing into Europe so many high-class seedlings of Transatlantic origin, and have thus materially aided the extension of the popularity of this famous flower, have decided to retire from their European establishment, and devote the whole of their energies to their Nursery in the States. Their collection of Chrysanthemums, which was surpassingly rich in rare and novel varieties, has consequently passed into my hands, and being added to my own already comprehensive collection, places it in the proud position of being the largest and most valuable one in the entire world. Upwards of 3000 growing plants have by this means been added to the Ryecroft Collection of Chrysanthemums, 1400 of the new-comers being American Seedlings selected from a total of 35,000 new varieties raised in the States last year. Such an acquisition as this has been effected after considerable negotiation, and at an unheard-of expense; but I am well assured that the many unknown floral gems which it contains, and the consequent advantage that will accrue to my friends and customers, and, in fact, the Chrysanthemum world on this side of the Atlantic, will be ample repayment for the truly stupendous undertaking of acquiring this vast collection.

It will be quite impossible to issue a list of these new American varieties until after the Shows, when I shall hope to publish, with my full Catalogue, a Special Descriptive List, indicating the principal characteristics of my new purchase. Growers and Exhibitors desirous of keeping in the front rank will therefore do well to await the publication of it before proceeding to lay in a stock of other novelties, which may probably be pushed aside immediately the new American Seedlings are distributed. This is beyond question the greatest feat ever undertaken by any Chrysanthemum specialist, particularly at this busy season of the year; and my greatest reward will be to find that I have been the means of preserving such a valuable collection from passing into the hands of Continental growers, who are yearly becoming more keenly alive to the necessity of acquiring American Seedlings as a basis upon which to work for future novelties.

H. J. JONES, RYECROFT NURSERY, HITHER GREEN, LEWISHAM.

F. SANDER & CO.'S GRAND IMPORTATIONS, ON SALE, NOVEMBER 10, AT MESSRS. PROTHEROE & MORRIS', 67 & 68, CHEAPSIDE, E.C.

DENDROBIUM IMPERATRIX (Kranzlin).—A superb new species, discovered in New Guinea. Sepals soft rose, lip pure white, and the large petals purple. The flowers are borne in simply marvellous profusion.

DENDROBIUM VERATRIFOLIUM (Lindley).—Now introduced for the first time. Flowers large, pure white. Dr. Lindley says, "A most beautiful plant, with racemes 1½ feet long, loaded with flowers whose spatula-shaped petals are 1 inch and more in length." New Guinea.

ONCIDIUM SANDERIANUM (Rolfe).—A grand new discovery allied to the Macrantha section. Petals rich deep brownish-red, with gold margins and blotches, sepals same colour, but without the golden margins. The petals are a remarkable feature, standing boldly upright, as in *O. Kramerii*. The flowers are 4 inches in diameter, and are carried in profusion. The finest *Oncidium* discovered of late years.

BULBOPHYLLUM ERICSSONII (Kranzlin).—An entirely new and splendid species, and the finest of the genus, sepals and petals yellow, lip red. Dr. Kranzlin says, *Gardeners' Chronicle*, Oct. 28, 1893:—"Imagine a group of from nine to twelve flowers of a large Chimeroid *Mastodalla* surmounting a slender flower-stalk, and you will get an idea of this extraordinary new *Bulbophyllum*." The beauty of the inflorescence is indescribable. It is suggestive of a group of gorgeously-plumaged love birds perching close together on a twig.

PERISTERIA ASPERSA (Rolfe), and varieties aurantiaea, purpurea, atro-sanguinea, &c., a magnificent and free-flowering species, abounding in novel and beautiful shades of colour from pure white to the deepest crimson lake.

MESOSPIDIUM GRANDIFLORUM.—A splendid new variety, the most charming of cool-house Orchids, and by far the brightest in colour and boldest in form of the entire section.

ONCIDIUM HASTIFERUM.—Most brilliantly coloured, large-flowered, short-spiked variety of *O. macranthum*.

ONCIDIUM AUROSUM SPLENDENS, the true majus form.

A new and colossal-bulbed **ONCIDIUM** or **ODONTOGLOSSUM**. A new **LYCASTE** or **MAXILLARIA** SPECIES. A new **COELOGYNE**. A grand lot of the glorious

DENDROBIUM PHALANOPSIS SCHRODERIANA.

ANGULO CLOVESII ALBA.—The snow-white and extremely rare Cradle Orchid.

ODONTOGLOSSUM HYTRIX.—Rich in fine forms. A splendid importation.

NEW ONCIDIUMS, NEW ODONTOGLOSSUMS, LYCASTES,
 &c., &c., &c.

PAUL & SON

NEW TOMATO, "EMPRESS OF INDIA."

For Market Purposes, Exhibition, or Private Use, this variety will prove one of the very best, the fruit being a beautiful bright scarlet colour, massive, and without ribs, very solid and heavy, well flavoured, and with very few seeds. A prolific bearer. Very short-jointed plants, 6 to 7 feet long (single stem), carrying from nine to ten bunches of fruit, averaging 3 to 4 lb. each bunch.

See report in *Gardeners' Chronicle* for Sept. 30 & Oct. 7, 1893. Sold in 1s. packets. Can be procured from the raisers, J. COBRAN and SON, Seedsman, Market Place, Rotherham; or, from Messrs. HURST and SON, 152, Houndsditch, E.

WM. PAUL & SON,
Rose Growers by Appointment to Her Majesty the Queen,
TREE, PLANT, BULB and SEED MERCHANTS,
WALTHAM CROSS, HERTS.

ANTHONY WATERER respectfully invites from intending Planters an inspection of the following well-grown and finely-rooted EVERGREENS:—

- ABIES DOUGLASSII GLAUCA, 5, 6, 7, and 8 feet.
- " HOOKERIANA (Pattoniana), 4, 5, and 6 feet.
- " PUNGENS GLAUCA (Colorado Blue Spruce), 3, 4, 5, and 6 feet.
- " ARGENTEA " 3, 4, 5, and 6 feet.
- CEDRUS ATLANTICA GLAUCA, 4, 5, 6, and 7 feet.
- CEDARS OF LEBANON, 5, 6, 7, 8 to 10 feet.
- GOLDEN CHINESE JUNIPER, 1, 5, 6, 8, and 10 feet.
- GOLDEN YEW, Seedlings, 4, 5, 6, and 7 feet.
- PICEA CONCOLOR " 4, 5, 6, 7, and 8 feet.
- " VIOLACEA " 4, 5, 6, 7, and 8 feet.
- " LASIOCARPA " 5, 6, to 8 feet.
- " MAGNIFICA " 5, 6, to 8 feet.
- PINUS AUSTRIACA " 3, 4, 5, 6, to 8 feet.
- " LARICIO " 3, 4, 5, 6, to 8 feet.
- THUIOPSIS BOREALIS " 5 to 8 feet.
- " DOLABRATA " 5 to 8 feet.
- HOLLIES, GREEN, Common, up to 10 and 12 feet.
- " HODGINS " up to 10 feet.
- " LAURIFOLIA " up to 10 feet.
- " MYRTIFOLIA " up to 10 feet.
- " GOLDEN QUEEN.
- " SILVER QUEEN.
- " WATERER'S, and many other variegated kinds, 6 to 10 feet.
- " PERRY'S WEEPING } with straight stems and
- " GOLDEN WEEPING } fine heads.

Knap Hill Nursery, Woking, Surrey.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 4, 1893.

FONTHILL ABBEY.

THE delightful seat of Sir Michael Shaw Stewart, Bart., named Fonthill Abbey, and situated in the parish of Fonthill Giffard, Tisbury, Wilts, must not be confounded with the instable and enormous house, the Fonthill Abbey of the accomplished and eccentric Mr. Beckford, author of the *History of the Caliph Vathek*. The former is a substantial and handsome mansion, in the Early English style, built by the Marquis of Westminster in 1858. The latter is a ruin, which is reached from the present house by a short walk through some shrubberies, where it will be found on a large and level plateau of smooth turf, which was once entirely occupied by the abbey, whose ruined tower now alone remains. The rest of this great windfall has been cleared away, and a beautiful lawn covers the site where the ugly ruin lay mouldering. I regret to show any disrespect for an abbey; but there is a wide difference between Mr. Beckford's Fonthill Abbey—which, in fact, was not an abbey—and Tintern Abbey, whose broken walls still stand, after hundreds of years of storms.

Fountains Abbey is another venerable ruin, beautiful as a glorious dream, and so durable, that even in its shattered condition, such protection as Lord Ripon gives it will preserve it for centuries to come. But Fountains Abbey was built by prayerful and patient monks, watching the work for years, and living in huts beneath the Yew trees, to be near it. Mr. Beckford, on the contrary, was a childish impatient man, and such men should not build. If they do, with their sudden orders, their relays of men, and lanterns at night, a downfall happens, and then you have, not a venerable ruin, but a mixture of rubbish, which in this case has been wisely cleared away, except the tower. This small sample of the most durable part of the building is situated about as far from Sir Michael Stewart's house as Hawarden Castle is from Mr. Gladstone's residence, which, by the way, has little of a castle about it but the name.

There is, perhaps, no folly more common than that of building houses which are unsuited to the wants, or too costly for the fortunes of their owners. Most persons probably could point out a dozen such houses, but the greatest folly of the present century in this direction was the building of Fonthill Abbey. Mr. Beckford seems to have inherited his weakness, his father, Alderman Beckford, having squandered an enormous sum of money in building Fonthill House, which his son allowed to become dilapidated, and which was afterwards replaced by the handsome residence of Mr. Alfred Morrison. The site of the so-called abbey was well chosen. It is on high ground, and surrounded

with thick groves of Beeches. The spot where the abbey stood is covered with smooth turf, and a wide approach road, also on delicious turf, passes down an avenue three quarters of a mile in length, and formed of noble trees, tall and dense, on either side. At the end of the avenue there is a lodge, where the gates open on the hard road leading to Tisbury.

At the present time nothing remains of the abbey but part of its tower, the more lofty portion having made it obeisance to the new owner, as Mr. Beckford facetiously remarked on hearing of its fall. As you stand on the grass-covered grave of Mr. Beckford's foundation, if he dug any, the higher ground on the north of the site, the woods of Beech and other timber, and the magnificent avenue together shut out the distant view. It is, however, a fine site for a house, and as the ornament of fine timber is there already, it may be called a ready-made site.

Mr. William Beckford, author of a successful book and of this unfortunate abbey, was born in 1761, and died at Bath, relieved of much of his enormous wealth, in 1844. He had a princely place near Cintra, and came to England, and down into Wilts, a much-travelled, highly cultivated man, famous, and fabulously wealthy. He began to build, and so impatient was he to get his house finished, that he employed relays of workmen, hurrying on with it day and night, Sundays included. After his impulsive fashion, he spared neither beer nor bribe, till the tower was up—a wooden tower, which was then taken down. The second tower was built of wood and cement, and this structure fell down. The third tower, formed of brick and stone, was built on the foundations of a summer-house, and the winds and the rain beat upon it a few years, when it came down as already mentioned. Other eccentricities followed. On one occasion a new walk in the woods was determined on, and the village was summoned, and worked all night, in order that Mr. Beckford might find his fancy finished in time for his morning ride. Sometimes he was charitable in great haste, and would distribute one hundred pairs of blankets to the poor, or he would requisition all the carts and wagons in the village to fetch a supply of coal. If the people saw him coming, when he rode beyond his grounds, they always expected something uncommon to follow, and sometimes it was a hurrae-whipping when he felt annoyed, and then a guinea to assuage the smarting. He would order dinner for twelve, with twelve servants to wait, when he and his daughter were the only persons to be fed. This daughter, the Duchess of Hamilton, lived here a recluse like himself. On one occasion an adventurous stranger entered the grounds and met the owner, whom he took for a gardener. Mr. Beckford invited him to dinner, and after a sumptuous repast the host vanished. Having waited a considerable time the guest ventured to make a noise, there were no bells in the house, and forthwith the butler appeared and most politely led him to the door. "Mr. Beckford," he said, "went to bed some time ago, and he bid me say, that as you found your way into his grounds you may now find your way out; and you had better avoid the dogs, which are let loose at night for our protection."

Mr. Beckford's most costly freak on the estate, except the house, was the wall round the park. Meeting the hounds one day within his sacred precincts, he was exceedingly indignant at the intrusion. Seven miles of wall were built to secure the privacy of his park and grounds for the future, and in several parts of the shrubberies of the present abbey its foundations are met with. The height of that which remains varies from 5 feet to 7 feet, which was held to be sufficient to exclude the world, and to secure for the Caliph of Fonthill such privacy as a spider enjoys in its hole. It is fortunate that landowners of this class are rare, since little good can come of a cultivated intellect and a heavy purse like Mr. Beckford's unless these endowments are under the direction of good sense and good nature.

Sir Michael Stewart's house stands on rather lower ground than the site of the abbey, but it

occupies a more prominent and still better position. The house is quite in harmony with its beautiful surroundings. It stands in a terraced garden facing the south, and immediately around is some exceedingly picturesque scenery with plenty of woods and shrubberies, and pheasants, which are seen sometimes on the lawn before the windows. There is a meeting of several strata of rocks just here, and the surface is much tumbled about, the upheaval which occasioned this unlevel surface having formed deep vales and corresponding hills, covered with wood. Beacon Hill, which is wooded to the top, and is seen from afar, is the highest point here, and beneath it is a gorge, which Mr. Macey, the gardener, pointed out with pride. This is known as the American Garden, and is filled with shrubs suitable to such a garden—Rhododendrons, Kalmias, and Azaleas. It is always a lovely spot, and in May and June, when the flowering shrubs are in blossom, it is superb. Considering the very picturesque surroundings of the house, it is felt perhaps that elaborate horticulture would be out of place; and the excellent gardening does not include extensive ranges of glass-houses, or culture of a very artificial character. *H. E.*

NEW OR NOTEWORTHY PLANTS.

KNIPHOFIA CITRINA, *Baker, n. sp.**

This new *Kniphofia* has just been introduced into cultivation by Herr Max Leichtlin from the mountains north of Grahamstown. It has the linear leaves and slender peduncle of *K. Macowani*, which comes from the same district, but the flower is very different, being shorter, pale yellow, and with the stamens as decidedly exerted as in the old *K. pumila* (*Bot. Mag.*, tab. 764). Its nearest ally is the *Zulu K. gracilis* of Harvey, which has not yet been brought into cultivation. It is hardy, and flowers in October.

Root-fibres very long. Leaves many to a stem, linear, moderately firm, green, $1\frac{1}{2}$ to 2 feet long, $\frac{1}{2}$ in. broad low down, tapering gradually to the point, triquetrous on the back, and acutely channelled down the face, slightly scabrous on the edge. Peduncle slender. Raceme dense, oblong, 2 to 3 inches long; pedicels very short; bracts scarious, white, oblong-lanceolate, $\frac{1}{4}$ to $\frac{1}{2}$ inch long. Perianth sub-cylindrical, pale yellow, 9 or 10 lines long, $\frac{1}{2}$ inch in diameter low down, $\frac{1}{2}$ inch at the throat; lobes small, ovate, with a faint green keel. Stamens much exerted, the longer three $\frac{1}{2}$ inch; anthers small, oblong, pale yellow. *J. G. Baker, Herbarium, Kew.*

ORCHID NOTES AND GLEANINGS.

POLYSTACHYA PUBESCENS.

This pretty and fragrant species, which was formerly known as *Epiphora pubescens*, is one of the most neat and easily grown of cool-house Orchids. Its erect racemes of flowers are rich yellow, with a few purple lines on the segments, and they last in perfection for several months. A plant of it is in bloom in the Orchid Nursery of Mr. H. A. Tracy, Amyand Park Road, Twickenham.

CATTLEYA WARSCEWICZII.

An immense flower of a light-coloured form, reminding one of the earlier importations of this plant, comes from the Rev. J. P. Way, Warwick. There are now several distinct types of *C. Warscewiczii*, but this is one of the best of the light tinted forms we have seen; its expanded petals measure over 8 inches in width, and each is nearly 3 inches wide, the flowers being well formed. A

* *Kniphofia citrina*, *Baker, n. sp.*—Fibris radicalibus gracilibus elongatis; foliis pluribus linearibus viridibus bipetalibus dorsu triquetris facie acute canaliculatis margine scabris; pedunculo gracili; racemis densis oblongis; pericallis brevissimis; bracteis oblongo-lanceolatis; perianthio subcylindrico sub-pureo 9—10 line longo, lobis parvis ovatis viridi; carinatis-staminibus longis exertis.

similar form, but one in which one of the petals shows traces of the same yellow tint found in the *labellum*, comes from Mr. Mark Watta, gr. to G. D. Owen, Esq., Selwood, Rotherham.

AMERICAN PARKS AND GARDENS.

(Continued from p. 502.)

GERMANTOWN.—"One of the most interesting days I spent in America was in Germantown, where I visited Mr. Thomas Meehan, the Nestor among American tree lovers and planters. I was particularly glad to make Mr. Meehan's acquaintance, because fifty years ago he was a gardener at Kew, where he laid the foundation of that extensive knowledge which has enabled him to build up one of the most important nurseries in America. Here I found a larger number of American trees and shrubs than can be found in any other nursery in the world; and it is through Mr. Meehan's efforts, I am told, that American trees are now so much more largely cultivated in their native land than they were a quarter of a century ago. In this nursery may be found seedlings of American Oaks, Elms, Hickories, Dogwoods, and Maples, by tens of thousands; and here is the only place, I believe, where many of the rarer trees and shrubs can be had in large quantities. Here, too, I saw remarkable examples of many rare trees, such as the broad-leaved Maple of Oregon, the *Cedrela* from Northern China, the *Hovenia dulcis* of Japan, a curious tree, with thick fleshy fruit-stems, which are eaten by the Japanese. Mr. Meehan has done the people good service in securing several small parks, including the site of the famous Bartram Garden, which was the first botanical garden in the New World. During the fifteen years since he entered the Common Council of his adopted city, he has been instrumental in adding eighteen small parks to the park-system of Philadelphia.

"Germantown itself is a place which every foreigner interested in American trees should visit, as the people of this suburb of Philadelphia 100 years ago were especially interested in the introduction and cultivation of rare trees, and the first cultivated specimens of several American trees were originally planted here, and may still be seen. Among these is the oldest-planted specimen in America of the beautiful *Virgilia*, or yellow-wood of the Southern States, which stands in the grounds of the Germantown Cricket Club, a club, by the way, which has a more beautiful house and is provided with a better laid-out ground than any I have seen in England. The clubhouse, a large brick structure, was designed by one of your New York architects, Mr. McKim, who also made the plan for the architectural walls which surround the field as well as the grand-stand, which is the only structure of the kind I have seen which possesses any claim to artistic merit. In this cricket ground is the finest cultivated plant of the Cucumber tree (*Magnolia acuminata*) that I ever encountered. In Germantown, too, I saw a remarkable specimen of the Pecan Hickory, which was raised from seed brought from Arkansas by the English naturalist, Nuttall. In Vernon Park, the latest of the parks which Mr. Meehan has acquired for Philadelphia, is the first *Magnolia macrophylla* ever planted in America, and here, too, are remarkable specimens of the native "Papaw," (*Asimina*) more than forty years old, and with trunks $1\frac{1}{2}$ foot through. The roads of Germantown are shaded with beautiful rows of native trees, and behind them stretch the green lawns of innumerable villas.

Flushing.—"Another notable town is Flushing, L. I., which I visited for the purpose of inspecting the Kissena nurseries of Parsons & Co., because here were cultivated many of the plants which were introduced to cultivation by Mr. Thomas Hogg, Dr. Hall, and other American travellers in Japan. In this town, on a piece of ground which once formed part of the old Parson's Nursery, are three trees of exceptional value—

the largest plant of the Golden Larch of China which I have ever seen, a remarkably fine Purple Beech, and a Weeping Beech, with a greater spread of branches, and larger in every way, than I had ever seen before. These noble trees should be preserved, it seems to me, for future generations, for I do not think they can be duplicated anywhere in America. The streets of Flushing are better planted, perhaps, than those of any country town which I have visited here, and I particularly admired the rows of Pin Oaks, which have been largely used here, and with excellent effect. Speaking of street trees, I may say that on a hurried visit to Washington, I was impressed with the systematic planting of the street, in that capital. Taken all round, it is the best

Potato disease appeared in 1892 upon the station grounds on July 20. All Potato foliage was immediately sprayed with Bordeaux Mixture, excepting a few rows in each field that were left untreated for comparison. In all cases the treated foliage resisted the disease better than the others. However, the foliage of the Early Rose soon began to turn brown and dry up, although it was evident that they were not quite matured. Two other applications of the Mixture were made while the tops gave evidence of growth. The increase in the yield of large Potatoes, due to treatment, was estimated to average about one-fourth of the crop. The early varieties gave the least increase, and the late varieties the most.

A field of Late Beauty of Hebron, at Kingston,

marked; the yield was almost doubled by it, and the tubers were much larger and fairer than where no treatment was given.

Another field of Late Beauty of Hebron Potatoes was treated at West Kingston. The field was planted somewhat earlier than the one at Kingston, and the soil was not as moist, consequently the foliage was more nearly mature about the middle of July, when the blight appeared. The first application of the Bordeaux Mixture was made on July 21. The top growth was large and even, with scattering blossoms here and there upon them, although the height of the blossoming season had passed. Check rows were left on either side of the field, while the main central part was treated. On July 30 a second application was made; and on August 6, the third and last was afforded. The foliage of the check rows was at this time almost entirely dead, while that of the treated rows was still alive and growing. This condition remained, however, only for about ten days, after which the treated tops gradually became dry and brown. Test plots of these Potatoes were dug on September 27, from which it was determined that the average yield of tubers had been increased 21.7 per cent., or a little more than 48½ bushels per acre, by the treatment.

EXPERIMENTS WITH REMEDY FOR POTATO "SCAB."

The Bordeaux Mixture was applied upon seed-Potatoes at the time of planting. Four rows of Chas. Downing variety, each 50 feet long, were used in the experiment, two of which were, and two of which were not, treated. Potatoes were grown in the field the previous year, and stable-manure was the only fertiliser applied. The results were as follows:—

Treated.	Total.	Scabby.
Yield of large Potatoes ...	62 lb.	9 per cent.
Yield of small Potatoes ...	55 lb.	9 per cent.
Not treated.	Total.	Scabby.
Yield of large Potatoes ...	53 lb.	21 per cent.
Yield of small Potatoes ...	77 lb.	12 per cent.

The disease was not so prevalent in the field as in some seasons, even when the Potatoes were not treated; still, the results of treatment were more apparent at the time of harvesting than is indicated by the figures given, for in the untreated rows, those Potatoes that were attacked by the disease were generally much more disfigured by it, and thus rendered more unsaleable than those where treatment had been given. *J. J. Willis, Harpenden.*

CIRRHOPE TALUM ORNATISSIMUM.

At last a Cirrhopetalum has been found which has been deemed worthy of a First-class Certificate by the Orchid Committee of the Royal Horticultural Society, the award being made to the plant, the subject of our illustration, when it was exhibited by Sir Trevor Lawrence at the meeting on October 24. It is a beautiful and quaint species, its yellowish flowers being beautifully marked with purple, the upper segment decorated with a purple fringe and the two side ones having tassels of a similar colour. The lip is deep purple, and the whole flower is most singular in its structure and remarkable in its colouring. (See fig. 91.)

NOTES FROM CHISWICK.

ASTERS.—The fine collection of Asters is now almost out of flower, a few varieties remaining in bloom [before the recent frost], being chiefly forms of *A. laevis* and *A. novi-belgii*. Amongst the latest of the genus in bloom is *A. novæ-angliæ*, a very showy Aster, represented by several forms in which the flowers vary in colour, some deeper than in the species, others shades of rose.

DAHLIAS.—The chief plants in bloom a few days ago were the Dahlias. Amongst the Pompon varieties the finest were Ernest, light rose, margined with crimson; Dr. Ranch, bright orange-red, an effective colour; Mars, scarlet; Little Darkie, deep maroon; and White Aster. In one bed were several plants in full bloom of the single Cactus Dahlias.

FIG. 91.—CIRRHOPE TALUM ORNATISSIMUM.

planted city I have ever visited. Some fifty species of trees are used, and many of the avenues are remarkably beautiful, particularly one in which the Ginkgo tree is used. I have not time to speak of the botanical gardens there, or the improvements that I found going on under the care of W. R. Smith, Superintendent of the Botanical Gardens, who is another old Kew man." *New York Daily Tribune, Sept. 10, 1893.*

(To be continued.)

POTATO DISEASES.

THE fifth annual report of the Agricultural Experimental Station at Rhode Island, just issued, gives, in the Horticultural Division, results of experiments in the treatment of the Potato blight and Potato scab.

was treated with the Bordeaux Mixture. The growth of the tops was very vigorous, the soil being both fertile and moist. The first application was made July 16, the plants being then in blossom, and apparently free from disease. July 29, a second application was made, the foliage at the time being generally fresh and green. On August 9, the third and last application was made. At this time the untreated check-rows gave evidence of the presence of the blight, and the treated rows were slightly attacked in spots. The disease seemed to spread rapidly over the foliage that had not been treated, and in a few days from the above date the foliage in the check-rows was quite brown and dry, while the foliage in the treated rows remained generally green until about September 1. The effect of this treatment upon the crop of Potatoes was very

They may be useful to cut for the house, but are not altogether satisfactory in the garden. The true single kinds are preferable.

Fuchsia fulgens.—A bed of this species is worth a note. It was in bloom from early summer, and recently was still flowering well. The flowers are red, tubular, and in rich contrast to the abundant leafage. One might almost call this *Fuchsia* a foliage plant. It is thoroughly well worth growing largely in large gardens.

The Chiswick gardens have been of much interest during the past year. Really interesting plants not seen everywhere were grown. *Cassia corymbosa* was in perfection quite late in October; also *Plumbago capensis*, which flowered freely during the summer. *V.*

PLANT NOTES.

ACHILLEA, THE PEARL.

This is a beautiful variety of *Achillea ptarmica*, the flowers quite twice as large as those of the double form—pure white, each like a little rosette, and produced with freedom. It is one of the most useful hardy plants of the garden for cutting, and the white clusters could be used in a variety of ways, whilst there is no difficulty in growing the plant well. It will certainly take the place of the common double variety. *A. The Pearl* and *A. mongolica* are two plants that all who care for hardy things for cutting and effect should grow largely. The latter has single flowers, not quite so large as a half-penny, and pure white; it is not difficult to grow. *V.*

PTERIS LONGIFOLIA VAR. MARIESII.

This promising novelty is proving itself to be a very useful and desirable introduction in the Royal Exotic Nursery, King's Road, Chelsea. Its fronds are lighter in colour, more elegant in their arrangement, and are more gracefully arched than in the old species. So different indeed is this from the type, that some might regard it as a distinct species. It is sure to be considered a valuable addition to collections of Ferns, and it is more than probable that it will figure as a market Fern on a large scale.

ROSSLYN, STOKE NEWINGTON.

The above, the residence of H. T. Pitt, Esq., possesses a garden of about three and a-half acres in extent, which is divided between the cultivation of flowers, fruits, and vegetables. In each department of the garden some interesting examples of good culture may be found. Two specially interesting features exist in the garden, one being a gigantic and aged tree of *Catalpa bignonioides*, which is supposed to be one of the first trees that was planted in this country, and which has been covered with flowers this year, as it is said to be every year. The other remarkable feature is a kind of dell beneath the shade of trees, in which a rustic garden with a fountain in the centre, was formed many years ago, and which was probably the summer retreat of former owners, who like the present one, took great interest in their garden. The charm of this quiet nook is, that the Ives, Vincas, Ferns, and other things, originally planted, are allowed to grow as they please, and are only trained to make the paths passable to pedestrians. But as in many other suburban residences, gardening under glass receives the chief attention, and among fruits, the Pine-apple and Strawberry are remarkably well done; and in the various greenhouses and stoves we found a more than usually well-grown collection of Ferns, foliage plants, Azaleas, Camellias, and other plants. In one house, plants of the white, canary, and orange-coloured varieties of *Thunbergia alata* were very pretty; in another, the *Eucharis grandiflora* was in bloom; another had a good show of *Gloxinia*s, while several were brightened by *Chrysanthemums* not grown like the usual exhibition-plant, but

so as to produce a large number of useful flowers, which prolong their flowering to the latest possible time.

The Orchids, which are Mr. Pitt's first favourites, occupy not only all the structures which were specially built for Orchid-culture, but many of the older houses, the soft-wooded plants and stove plants once grown in them being ousted thereby. This is not to be regretted, the London fogs having annually rendered their cultivation more and more unsatisfactory and difficult. The same difficulty does not extend to the Orchids, except so far as the loss of some of their flowers is concerned, the plants themselves being as healthy as those grown in the pure air of the country. It is believed here that it is of great assistance to Orchids grown near London if they are supplied previous to the arrival of winter with sound sweet materials about the roots, and any which are considered not to be fitted in that respect to last in good condition till the spring are repotted. This block of houses contains six divisions, and in the one next to that in which the *Cattleyas* are, *Phalaenopsis* are thriving admirably. There also is what is said to be the finest variety of *Oncidium Kramerii* in the country, which cost six guineas, a good sum of money for this species. *Angraecum sesquipedale*, *Ceologyne pandurata*, and many others requiring heat are doing well in this house; as are also some plants of the pretty white *Utricularia montana*.

The next house showed a fine lot of *Dendrobiums*, and one specimen of *D. nobile Cooksoni* was noted with thirteen new growths; *D. nobile nobilium*, *D. n. album*, *D. Wardianum album*, *D. crassinode album*, are varieties that are well represented. In one division plants of *Laelia purpurata*, *L. tenebrosa*, and other *Laelias* and *Cattleyas* were noted, and in another some fine plants of *Cymbidium*, *Sobralia*, and *Ceologyne*, especially a large panful of the true *C. cristata hololeuca*. In the next division were some grand varieties in bloom of *Oncidium tigrinum*, *Maxillarias*, *Lycaste Skinneri*, *Odontoglossum grande*, *Pleione lagenaria*, &c. Here, also some masses of *Trichopilia suavis* do better than in most places, and are very large, stout, and healthy.

The range of cool-houses recently erected contains unflowered specimens of the best type of *Odontoglossum crispum*, these being the pick of the importations of this and the previous season, many of them being large masses with from four to eight leading growths. Great hopes are entertained of them, and if any should prove on flowering to be unsatisfactory, it will not be for lack of good culture. Indeed, everything about them, and the houses themselves are made scrupulously clean, as was manifest at the time of our visit. Here, as everywhere else where it is grown in quantity, *Cattleya labiata autumnalis* makes the most show, and proves itself an invaluable plant. In one house, we found the plants of this gorgeous species literally loaded with flowers, but still great variety was noted in the flowers themselves, and in the artistic and informal manner in which they were arranged; and although the show was all of *Cattleya labiata*, there was no lack of variety. Some of the flowers had very rich colours, the darker tints predominating, and several had flowers of a delicate blush-white, and with a slight crimson feather in the lip. Several of the light forms in the labellum much resembled *C. Warscewiczii*. Here also are some grand spikes of *Oncidium varicosum* var. *Rogersii*, and among the *Masdevallias* that curious little *M. simula*, with many of its quaintly-marked flowers.

In the *Cypripedium*-house was noted a good number of the pretty *C. exul*, varieties of *C. insigne*, well-flowered; a magnificent specimen of *C. Eliotianum*, *C. × orphanum superbum*, with two very large flowers on a spike; some fine forms of *C. × Ashburtoniae*, *C. × Dominicanum*, *C. Boxalli*, *C. calurum*, and others in bloom; while among the newer additions to the collection is the rather expensive, but decidedly pretty *C. × Niobe*, *Shorthills* var. In one of the other houses we found some splendidly-flowered specimens of the white and orange-flowered

Dendrobium formosum giganteum, *Phalaenopsis Schroderianum* and its ally *Dendrobium Phalaenopsis Statterianum*, with rich sprays of bloom, a fine form of *Odontoglossum Inseayi splendens*, and that now uncommon object, a large plant of *Odontoglossum Uro-Skinneri*, &c. At the edges of the benches pots of the silver and green-leaved *Sibthorpia europaea variegata* are placed, and which so many would like to grow, but cannot owing to some cause or other.

Among other noteworthy things we remarked some plants of *Vanda cœrulea*, successfully grown in a cool-house; *Dendrobium McCarthiae* and *Vanda Hookeri*, in a warm one; and in every house evidence of the careful choice of positions for the more tender or more difficult grown species.

THE BULB GARDEN.

AMARYLLIS BELLADONNA.

It matters little whether the wall is that of an Orchid-house or of a cool Peach-house, as long as it has a southern exposure, this plant will succeed if planted near it; but in the open it does no good in this part of the country [Hants]. The beauty of the flowers of this species of *Amaryllis* should be a sufficient recommendation for its more extended cultivation. In strong soils plenty of drainage ought to be provided [and the bed be raised above the general level. *Ed.*], and 10 inches of some light rich sandy compost as well, and then failure to flower this Lily will be owing to the season only. *E. M.*

LILIES AT WEYBRIDGE.

My annual note on our Lilies might have been sent sooner, as the unusual heat and drought made them bloom early, and with most species made the flowers short-lived. The first Lily which showed its appreciation of the fine weather was *L. Humboldti*; in most seasons, when the weather is cold and rough, this is apt to have spots both on the flowers and leaves; this year there was no trace of these, and all the varieties were very fine. The effect of the weather on *L. auratum* depended on situation; where the subsoil was damp, both growth and flowers were first-rate. In one bed in our wood at Oakwood, about 60 yards long, with different widths, there were about 2000 stems, of all heights, the tallest ranging from 7 to 9 feet high; a large number of these were out at the same time, and the effect was finer than we have ever had before. Happily, Mrs. Duffield was staying at the cottage, and painted a large group of these, so as to preserve an admirable remembrance. In drier situations it was a very different story. In one small hill-field of Lilies, which in wet seasons gives the finest show, both growth and flowers were stunted; and what proved that it was the drought that caused this was, that having moved some fruit trees from this field, we had filled up the vacant spaces with *L. auratum* bulbs taken from the wood-bed, so that exactly similar bulbs were in one place very fine, and in the other very poor. In another part in the wood, where *Rhododendrons* and *Oak trees* had exhausted the moisture, there was such little growth that I took up some bulbs to examine them; they were sound and healthy, so I expect that they will tell a different tale next year. Perhaps I should say that we have no artificial watering.

L. Kramerii and *L. auratum rubro-vittatum* in some places were good, but in most were much below par. The Lilies which rejoiced most in the hot weather and early season were *L. speciosum*; these, with the exception of some which had been moved into newly-prepared ground, and so more susceptible to drought, were in all sorts of situations, finer than we have ever had them before; no rough cold weather injured the late blooms, as is often the case in later seasons. *L. pardalinum* and *L. superbum*, being always planted in more or less damp places, were as usual, but the flowers were short-lived. Most of the other Lilies were the worse for the drought. *George F. Wilson.*

DIFFERENT SOILS EMPLOYED IN HORTICULTURE.

IN January and February of the present year we gave an abstract of a paper by M. Georges Truffaut, on "Leaf-Moulds, their Chemical and Physical Properties, and their Adaptability for various Horticultural Purposes." The author has now issued an enquiry into the formation and character of different moulds or soils employed by gardeners, of which the following is a sketch:—

M. Truffaut says, from early times horticulturists have attached great importance to the choice of the moulds which they employ in their work of cultivation. Both practice and science have demonstrated that particular kinds of soil are more suitable than others to certain plants. Scientific investigation upon this subject must, if rightly conducted be of immense value to the practical gardener, as revealing to him not only the physical qualities of the different soils, but their chemical composition, and consequently their manurial needs.

The work under discussion is divided into two parts. The first comprehends the general composition and formation of soils, the connection of organic with vegetable substances, and the absorbing properties of soils. The second part is devoted to the special study of divers types of soils or moulds employed in horticulture.

The author rightly remarks, that our exact knowledge of the composition of the moulds which we cultivate is very important, and that for several reasons; not the least being that this knowledge enables the gardener to use complementary manures for forcing purposes, and to adapt the supply to the requirements of the particular plant he wishes to raise.

In dealing with the question of the formation of soils, the author shows the important part played by decomposing vegetable substances. The humus, or decayed vegetable matter of soils, has its origin in the dead leaves, roots, &c., of a previous vegetation. It is continually forming wherever plants grow. It is the foundation, and often the entire source, of the organic portion of the soil.

Each year a certain portion of the vegetable growth dies off—leaves and branches fall, and portions of the roots decay. Part of the organic substance which falls upon the surface of the ground returns again to the atmosphere, but a certain part remains, and, added to that which decays underground, becomes available for future growth. The atmosphere of the soil, which at first differed but little from that which exists above it, becomes highly charged with carbonic acid, which decomposes the minerals in the soil, and thus year by year more and more of the nitrogen collected by each generation of plants becomes available for the generation that succeeds it.

The following table illustrates the increase of nitrogen formed during the process of fermentation and decay of certain selected vegetable products:—

Product examined.	Nitrogen per cent.			Authority.
	In original plant.	In the decomposed organic matter.	Increase.	
Hay	1.62	4.42	2.82	Kostycheff
Clover	2.00	5.28	3.28	"
Maize	1.88	4.50	2.62	"
Straw	1.27	2.10	0.83	"
Dogwood leaves ...	1.30	4.70	3.40	Mayer
Oak leaves	0.80	4.70	3.90	Truffaut
Heath	0.20	5.10	4.90	"

It will be remarked that there is an increase in the amount of nitrogen formed during the decay of the foregoing vegetable substances, ranging from 0.83 per cent. in straw, to nearly 5 per cent. in Heath.

Deep beds of vegetable mould are frequently met with in forests under trees, and on dry land generally, wherever vegetation is rank and neglected,

And the differences in the chemical composition of the original materials which compose a soil, mainly account for the enormous variation existing in the soils under cultivation, and of the amount of organic matter and of nitrogen which they contain.

The next table shows the amount of nitrogen contained in the leaves of certain trees in a fresh condition.

Nitrogen in 100 of leaves of—

Maple	0.98	per cent.
Plane	0.89	"
Horse Chestnut ...	0.54	"
Acacia (Robinia) ...	1.05	"
Lime	0.96	"
Service	0.88	"
Ash	0.84	"
Oak	0.80	"
Hazel	0.65	"
Plum	1.68	"
Poplar	0.98	"
Willow	1.28	"
Birch	0.52	"
Elm	0.74	"
Alder	1.36	"
Fir	0.57	"
Catalpa	0.70	"
Average	0.87	"

It is seen that the leaves of the Acacia, Plum, Willow, and Alder are the highest in the element nitrogen, and would therefore form the richest mould. The average amount of nitrogen in the seventeen descriptions of leaf is 0.87 per cent.

These facts teach us that the fertility of soils is due to the richness of the organic residues of previous generations of plants, mixed with certain mineral substances, the most important of which are phosphoric acid and potash.

The next table shows the amount of some selected constituents contained in certain plants, or portions of plants, which may be employed in the production of humus matter of soils.

Constituents in 100 of Vegetable Substance.

Description of Plant.	Water.	Nitrogen.	Phosphoric Acid.	Potash.
	Per cent.	Per cent.	Per cent.	Per cent.
Heath	10	0.9	0.10	0.40
Fern	18	2.4	0.45	2.40
Furze	16	2.5	0.23	0.80
Horsetail	14	1.8	0.41	2.70
Rushes	18	1.1	0.12	0.43
Moss	25	1.0	0.16	0.9
Leaves of Beech ...	15	0.8	0.24	2.58
" .. Oak	15	0.8	0.31	2.02
" .. Fir	17½	0.5	0.20	0.51
" .. Pine	13½	0.8	0.10	0.43
" .. Spruce	12½	0.9	0.20	1.60

Little by little under the combined influence in the soil of moisture and warmth, and the action of bacteria, the compound nitrogen of vegetable matter is transformed, and becomes the protean nucleus of microbes, which reproduce themselves with extreme rapidity, having for their object the carrying on of the work of oxidation and conversion from insoluble to soluble plant food.

The next table illustrates the composition of two moulds, employed for horticultural purposes.

Constituents.	Leaf Mould.	Forest Mould.
	Per cent.	Per cent.
Organic matter ...	17.00	8.46
Clay and silica ...	79.80	63.34
Nitrogen	0.50	0.45
Potash	0.31	0.73
Phosphoric acid ...	0.06	0.10
Lime	0.19	2.08
Magnesia	1.71
Soda	0.10
Iron oxide	0.23	4.98

The first point to observe is, the large quantity of organic matter present in the soils—in the leaf-mould 17 per cent., and in the forest-mould nearly 8½ per cent. In some samples of fertile mould the

amount of organic matter will not be more than 1½ per cent., while in the famous black soil of Russia it varies from 5 to 12 per cent.

It is also seen that these soils contain about half a per cent. of nitrogen, being nearly four times as much as the average of ordinary arable soils, and nearly five times as much as would be found in an impoverished soil. It is further to be observed that the moulds are correspondingly rich in all the other constituents of plant-food. *J. J. Willis, Harpenden.*

(To be continued.)

THE ROSARY.

ROSE FELLENERG.

This fine Noisette Rose has been very beautiful this year, especially when grown in a mass, the growth almost hidden beneath the wealth of bright crimson flowers. It is a remarkably free and vigorous Rose, and if the flowers are individually flimsy, they are brilliant in colour, produced in great profusion, and sweetly scented. Such a Rose must be seen in a mass like the Polyantha Rose. Our gardens would gain much if these beautiful old-fashioned Roses were more planted. *V.* [It is a Rose which makes very strong shoots, and is therefore a good variety for covering a bed by fastening the shoots to short stout stumps, driven into the soil, or hooked pegs; but it is better secured in the former manner, the flowers keeping cleaner. *Ed.*]

AN OLD ROSE TREE.

At Wierton House, near Maidstone, there is a tree of the old Noisette Rose, La Biche, which is forty-three years old. It is budded on a Briar stem, at about 27 inches from the ground, and has a crown about 16 feet high, and 14 feet wide. This plant is growing in a cool, moist position, on the north side of a building, is quite healthy and vigorous, and appears likely to live for many years if not molested. The top would have been much larger had it not been considerably damaged at some time by snow or wind. The circumference of the stem is 10½ inches. *W. H. Divers.*

CLIMBING NIPHETOS ROSE.

Some few years ago, upon reading a discussion in the *Gardeners' Chronicle* on the above subject, I instructed my gardener to try the experiment of budding the ordinary Niphetos Rose on Banksia Roses growing on the south side of this villa. The result is a perfectly climbing and very floriferous Niphetos. Given a sunny aspect and clever pruning, flowers in quantity can be gathered from this Rose in all months of the year, except one or two in the height of summer and in the depth of winter. The plant is perhaps rather twiggy, and so far the flowers have come smaller than those produced by this same Rose grown on its own stock; but they are very pretty in bud, and most suitable for button-holes.

Now select some of the branches or trailers which show the greatest aptitude for climbing, and multiply the plant by what the gardeners here call "Margotti." Make an incision, say in June, near the base of the branch, stripping up a flap of the bark and wood, about an inch, then insert a small wedge, to keep the wound open. Tie under the wound a handful of moss, and over the wound put some clayey soil. Wrap this again round with moss. Then take a thin sheet of lead about 8 inches square, and with this cover the whole mass round in the form of a funnel, with the mouth up. Water carefully every morning. By the end of the following October, the funnel should be full of roots. Cut the branch off below the roots, and the result will be a plant with the characteristics of the parent, i.e., a Niphetos Rose, with a strong inclination to climb. Another way to multiply the plant is by "propagation," or layering under ground. Dig a trench a foot or so deep, up to the Rose; drag down a climbing branch, and press it down into the trench with a little manure and good soil. Carry the branch along as far as its length will allow, and leave about a foot

above ground, and then fill up the trench. The piece left above ground will rapidly form a new plant, which you leave attached to the old one. Where circumstances permit, the foregoing is an excellent plan. *T. C. H., Firenze.*

ROSES FOR COVERING WALLS AND FENCES.

One of the most important points when planting these is to know about the size to which each variety will attain, and unless this be borne in mind, some portion of the wall, &c., may be almost unclimbed. In ordering Roses for this purpose, choose from the nurserymen varieties that are of a similar style in growth, or else plant them at distances suitable for each variety. For example, *L'Idéal* should have twice the amount of space allotted that would suffice for *Ophir*; *Climbing Perle des Jardins* needs thrice the space found suitable for *Marie van Houtte*, and so on. One can easily see how it is that fences are so unevenly clothed when they remember that a given distance apart is usually allotted to each variety. While not admiring strict formality, I like to see a fence clothed uniformly, and having the bulk of its varieties in flower together. As far as the strong-growing Roses are concerned, this is not difficult, *Gloire de Dijon* and its varieties, with most of the extra-strong Teas and *Noisette*, usually flowering within a week or so of one another.

One of the most satisfactory methods of covering a wall or fence with Roses is to plant two distinct types of growth alternately. For instance, I would place the following six Roses 12 or 15 feet apart: *W. Allen Richardson*, *L'Idéal*, *Maréchal Niel*, *Reine M. Henriette*, *Climbing Perle des Jardins*, *Climbing Niphotos*, and also any of the *Dijon Teas*. All of the extra vigorous growers of similar character might be treated in the same manner. These I would let grow more or less at will, only securing as large a quantity of vigorous wood as possible annually. As the wall or fence became filled, I would thin out the older shoots rather severely during the summer, and at pruning time in the spring. Between these strong varieties I would place such as *Anna Ollivier*, *Madame des Tartas*, *Caroline Kuster*, *Dr. Grill*, *Madame Falcot*, and in fact any of the strong growers which are not climbers proper. All Roses do splendidly against a wall or fence, and this latter class will keep the lower portions between the extra vigorous growers from presenting a bare appearance. Nor is this the only advantage of such a combination, for we get a constant crop of flower from June until severe frosts come. The majority of the climbers flower once a season only, seldom producing more than a few solitary blooms after the grand show of early summer is past. The other growers, on the contrary, give us a succession of blooms all through the season, one crop following the other with delightful certainty, and thus rendering the whole fence a source of delight throughout the summer and autumn, as well as during late spring. *A. P.*

FOREIGN CORRESPONDENCE.

MADAGASCAR. — EULOPHIELLA ELISABETHÆ.

CONSIDERABLE publicity having been given in many English newspapers (but not in the *Gardeners' Chronicle*) to a translation of a letter addressed to Messrs. Sander, of St. Albans, the well-known Orchid-grower, from M. Hamelin, the discoverer of the new Orchid from Madagascar, the *Eulophiella Elisabethæ*, I trust you will find space in your paper for the following lines on the subject. As I have been a resident in the island for more than twenty years, and have gathered thousands of plants in various localities, north, south, east, and west, you will see that I know something of the flora of this interesting country, and something also of the conditions of travelling in it. But certain it is, in my opinion, that many, nay, most of the statements made, are purely imaginary. The procuring of the Orchid has been surrounded by an air of mystery and danger, which makes the story incredible to

anyone acquainted with Madagascar. As you will have seen, the narrative is larded throughout with such phrases as the following:—

"*Eulophiella Elisabethæ* hardly exists now. The plant grows in a country inaccessible to Europeans. I had a special privilege accorded me to penetrate those regions, &c."

"This plant only grows in a very limited region (I believe he somewhere states 'a swamp') . . . on the tops of the tallest trees."

"Under the special care of my brother-in-blood . . . to prevent the total extinction of the species."

"Amateurs may trust that no plant of this species can or will be imported."

"Enormous difficulties and manifold dangers have to be surmounted before even the country where they grow can be reached."

"I had numerous obstacles to overcome, and was obliged to make enormous sacrifices, and to incur fearful expenses, &c."

"An amateur paying 100s. for a plant would not cover the cost. Not counting the constant exposure of my life, and the lives of those accompanying me, not only was our party exposed to the risk of being strangled by ferocious and hostile tribesmen—a fate that befell many a poor fellow belonging to our expedition—but we had to struggle almost night and day against the wild animals haunting these primeval forests. The most terrible of all is the *Protocrypta ferox madagascariensis* (*sic*), against which we had constantly to be on guard. During the day-time it is extremely dangerous, for it crouches in the forks of trees . . . and watches for its prey." (The latter part of this passage is pure and unmitigated fabrication.)

"Big fires had to be constantly kept up, &c."

"The favourite haunt of the '*Protocrypta ferox*' seemed to me to be amongst the masses of foliage where the *Eulophiella* grew. Here they were numerous."

"Appalling danger."

"There are also some gigantic hippopotamus and rhinoceros fossils in Madagascar, which I found in certain parts, and which, according to their bones, must be nearly six times as large as our elephants." (!)

Now, the truth is, that no rhinoceros bones have ever been discovered in Madagascar; and the bones of the extinct hippopotamus indicate an animal "of rather small dimensions."

It is simply in the interests of truth, and because these adventures have been given such prominence in so many English papers, that I write you these lines. To me the only credible fact connected with this story is that M. Hamelin has discovered a new and interesting Orchid somewhere in Madagascar, probably in the south or south-west, where travelling is somewhat dangerous; the rest is largely or entirely pure romance. *R. Baron, Antananarivo.*

[On receiving a copy of M. Hamelin's statement we did not think it desirable to produce it in the *Gardeners' Chronicle* until we had communicated with botanists familiar with that country. One of our correspondents who has collected largely in Madagascar, comments on the fact that M. Hamelin does not mention the place in which he journeyed. The *Protocrypta ferox* appeared to our correspondent very startling, as he met with no animal with such habits along his route. "There is, however," says our correspondent, confirming Mr. Baron, "a very considerable tract in south-west Madagascar, which has only been very hurriedly visited by Europeans, and it is quite possible that there are many new Orchids there, and that M. Hamelin became blood-brother of a chief, and married all his wives. M. Hamelin does not mention the want of water, which is a characteristic of the Epyornis country. If he penetrated this region and came out alive with a collection, he is a brave and clever fellow." Ed.]

CITRUS (LIMONIA) TRIFOLIATA.

We have in our nurseries at Calanphouth, near Antwerp, a splendid specimen of *Limonium trifoliata* covered with fruit, a sample of which I send for your inspection. Our plant forms a dense bush about 6 feet high, by 6 feet in diameter, and has passed

our most severe winters for many years without any protection whatever, and has not suffered in the least. It has flowered every year, and borne fruit occasionally, but this year a good number of fruits have been produced, which have acquired their full size and their pleasing lemon-yellow colour. As I never met in your esteemed paper with any hint about the fruiting of this plant, I assume that this sample may be of interest to you. *Ch. Van Geert, Antwerp.* [A similar specimen has been sent to us from Gloucestershire, of which more anon. Ed.]

A TRAVELLER'S NOTES.

(Continued from p. 462.)

COREA, June 1.—Since writing I have travelled 600 miles through the centre of the country; the journey was performed on ponies, taking exactly twenty-eight days, of which four days were devoted to repose or being entertained. From eight to ten hours a day, sometimes through unavoidable circumstances more, were spent in the saddle; for ten days the sun blazing the whole time, and varying between 85° and 100° in the shade, and what was worse, the nights were nearly as hot as the days. The remainder of the time we had some cloudy days, some equally hot. Tinned meats and rice were my provisions, the latter of excellent quality. I was received by the highest officials up to Prince Ming, Governor of the most important Korean Province, and said to be the leading man in the kingdom next to the King. He told me the hair of foreigners was red because they drank sheep's milk! I dined with a judge who trusted I would make my stomach as big as a mountain, and stayed and journeyed four days with one prefect, who, when he had consumed sufficient French Prunes, Huntley & Palmer's biscuits, pyretic saline, coffee, and whiskey—especially whiskey—hoped I would not leave him for ten, or even twenty years. Official runners were frequently placed at my disposal, causing all we met to go off the road, and those mounted to diamond. I was dismissed from one yamen (official residence) with a blare of trumpets, and received in another (in the prefect's chair, surrounded with guards, scribes, and a most discordant band of music), with the firing of a matchlock some centuries old. I saw two men publicly whipped (one must have been over sixty) because they had not got the lurch of a prefect and myself ready, and one prefect was put in such a good temper that he pardoned his prisoners of the day (four wretched creatures on long boards about 5 feet in length), reviewed all his attendants down to his female slaves—regular drudges, and his army of eight men (such men!) and two officers. I said it was magnificent, it was—magnificently funny; but I waited for two days, and I was some miles from the place before I laughed. Despots as friends are delightful, but I see no necessity to try them when offended. Government dancing girls, whose persons belong to the king and his officials, and who entertain guests as well, sang and danced at the order of Prince Ming, who told off an official to entertain me during my stay in his city. I was a curiosity to most, to some a startling novelty; in one place—a big city—when I rode down the main street one morning, men ran into houses and beckoned others out; a few moments' halt meant a crowd three to five deep, who had not washed for months. Children would frequently stare in blank amazement, then run away yelling. Women, except the lowest coolie class or very old, I never saw, excepting the dancing girls. Only once were we coldly received, and unpleasant occurrences were few. Once my Jack-of-all-trades, servant and coolie-thrasher, &c., pulled a man's hair out, and fists and feet were sometimes used with freedom. I intervened as seldom as possible, but when I thought it best was always treated with respect; in fact, they are afraid of you, not knowing one's power, or rather lack of power. I have walked my horse towards a man, and he simply ran helter-skelter. My interpreter, a shameless scoundrel, was the most difficult to manage; he robbed me unmercifully, but did me right well; he bears the character of being a first-rate man, and he is. To him is due all the official attentions I received. He always represented me as a most important personage—once I was "higher than general"—it all seemed to be taken in, and I thus saw much that I never should have seen, and what it is fair to surmise few Europeans have ever seen.

You (Messrs. Veitch) may safely claim the credit of being the first to send a man with a knowledge of plants through Corea. Few, very few (excepting

missionaries disliked by the natives and generally avoided by the Europeans) have been anywhere in the country, and it is most rare to find a resident who has summoned up moral courage to leave the hole where fate has placed him, and travel about. I say a hole, advisedly.

The country, contrary to my expectations, and to all that I had been told of it (very little), is rich, and much cultivated. The vegetation is rich, and I have formed a herbarium of plants, chiefly herbaceous and shrubby, and all more or less horticultural value.

My journey, at the best, for several reasons, was bound to be preliminary. Without the assistance of the missionaries, I doubt if I would have done so well.

COREA, July.—I am having five ponies and three men, beside the above two—one for self, one for interpreter, one for clothes, bed, &c., one for money,

be attacked. I should rather say a Corean would regard a European, as in China, with such universal contempt that it would not matter what one did. We all regard ourselves as most enlightened; Eastern nations regard us as just the opposite. The dress is curious; all wear tall black hats with broad brims of horsehair or Bamboo; all are dressed in white, the outer robe loose-flowing, confined by a girdle at the waist. Gentlemen sometimes wear beautifully-coloured silks. These clothes are taken off only at the change of the seasons; bathing is unknown; and the filth of their persons can be imagined. The streets—if streets they can be called—are very narrow, with an open drain, a reeking cesspool on each side; the stenches is sometimes sufficient to make one positively ill. It is a wonder cholera and typhoid ever cease to exist,

ANTHURIUM WAMBECKIANUM.

On October 10 last, Messrs. Linden, L'Horticulture Internationale, Brussels, showed at the meeting of the Royal Horticultural Society, amongst several other novelties and varieties, a plant under the above name, which possessed a spathe of dead white—not varnished, a spadix of pinkish-white, and leaves of the usual simple character. As a distinct looking variety of robust growth, it is worthy of cultivation for the contrast it affords to the varieties of Anthurium which have bright-coloured spathes. A First-class Certificate was granted to it by the Royal Horticultural Society.

A JEWISH HORTICULTURAL SCHOOL IN HANOVER.

An important movement has been started for the establishment of a Jewish Agricultural School in Bad Limmer-Brunnen, near Hanover. There can be no doubt that this is a much-needed enterprise, and every serious investigator of the present and future condition of the Jews in European lands will readily perceive that the movement deserves warm welcome, and in case the representations of its founder prove (as we have every reason to believe that they will) accurate, English philanthropists will do well to extend to Herr Alexander Moritz Simon, American Vice-Consul at Hanover, both moral and material support.

Herr Simon does not propose that all the pupils admitted into the school should inevitably be expected to devote themselves to gardening, agriculture, or farm labour, but those pupils who have a predilection for other pursuits will receive facilities for obtaining the necessary knowledge and dexterity.

In order to accomplish these ends, Herr Simon has acquired about 70 acres of excellent land near the town of Hanover, of which 30 acres are already in cultivation, and the requisite buildings are in course of erection to accommodate between 50 and 60 boys. The founder hopes to convert the school into a public institution. He has secured the services of an experienced Jewish teacher, who, with an adequate staff of assistants, will undertake the direction of the whole educational curriculum. The school will be managed in accordance with Jewish tradition, and all the requisite accoutrements for Jewish worship and home-life will (from the outset) be provided.

The general plan of education will be that of the ordinary public schools, with the addition of the religious training. The food supplied will be plain, but wholesome and efficient.

It is also proposed to establish a branch for girls on the same lines.

Herr Simon does not intend to restrict the advantages of the school to German boys. Therefore, the success of such an effort in Germany is obviously of consequence for the Jews of all countries.

Besides the ordinary school education, the boys will spend a portion of each day in outdoor manual work in the gardens of the school. The amount and severity of this work will be proportioned to the age and strength of the boys. Lads between the ages of fourteen and sixteen years, who desire to become gardeners, will, in addition to the facilities provided in the school itself, enjoy the privilege of obtaining further practical instruction elsewhere. The pupils will be allowed to continue their work under the direction of the most experienced teachers in the Royal Horticultural School at Geisenheim. Every facility will be afforded for the study of horticulture in open gardens as well as in hot-houses. Even the large fruit-gardens on the estate of the Duke of Cumberland, which are so universally and justly renowned, were placed at the disposal of the students from the spring of the present year.

The Government has agreed, in the most obliging manner, to supply the new institution with young fruit-trees at a very moderate price. Special attention will be given to pupils who show aptitude for the cultivation of fruit; other branches of horticulture will also be studied. It is unnecessary to note

FIG. 92.—ANTHURIUM WAMBECKIANUM: SPATHE WHITE; SPADIX PINKISH-WHITE.

and one for provisions; tinned meats, coffee, cocos, whiskey, &c., of the first named I have several dozen, very palatable with rice, to be obtained everywhere. Money is a great nuisance. It is possible to have a special letter, by which one can sign for the outlay in each village, redeemable at Seoul. American residents get this, but the English Consul is unable to oblige me. I am therefore taking a pony-load of cash, 70,000 pieces—strings of money, 3000 being equal to about 2s. 10d. This will last till I reach Gensan, where a further supply can be obtained.

The Coreans are a lazy, peaceable, filthy lot, the only annoyance likely to be felt being from curiosity, though contrary from what is the case in China, privacy is more or less respected. Some of the customs are most quaint; it is a country yet absolutely uncivilised. None but the women of the lowest coolies are seen; and if on meeting one by some exceptional accident one regards her fixedly, one would certainly

even in winter. The Japanese, strongly disliked, are in force here, and frequent rows are common. The more I see of that nation the less I like them, books and the tales of those visiting the country for a few weeks give a most erroneous impression of their deceitful, little character. The heat is great, and the rainy season is expected shortly. I shall get as far into the country as possible. The post is in the hands of the Japs, and as badly managed as theirs at home is well managed.

The tortures of this nation are severe. Two weeks ago two men tried to blow up the King's father; being caught, they were said to have been sawn in half, commencing at the skull. Robbers, highwaymen, &c., are also fearfully tortured; as were the first three French Bishops sent here—from 1841 to 1861. Christianity is still prohibited, but all Europeans are well and kindly treated now. James H. Veitch.

(To be continued.)

that the pupils will be more carefully supervised, and that their education will be more systematic, than could be the case in many private gardens.

During the winter months the boys will receive instruction in handicrafts.

As a rule, the pupils will remain in the institution up to the age at which they usually leave school, and then will continue, either within or without the institution, the course best suited to their tastes and capacity.

The total cost of maintaining a boy of school age is 400 marks (£20) a year; those who are already occupied in gardening, 150 to 200 marks. In the latter case the cost of clothing is not included. These sums seem estimated at a very low rate, and certainly no one can charge the founders of this new technical school with extravagant proposals.

There are two ways in which intending contributors may help the good work forward. Either they may contribute sums of money, or the implements and live stock. The list of desiderata is large, and we have no doubt that donors will come forward to supply these pressing needs. The total sum sought for the purchase of these requisites is 14,000 marks. This is not a very large amount, when the magnitude of the proposed work is taken into consideration.

Herr Simon has authorized the statement that he will gladly receive into the school English boys sent to him by any accredited body in this country. *Jewish Chronicle*, October 21.

AMERICAN CONIFEROUS FORESTS.

HAVING just returned from a trip to the west, I cannot but wonder at the apathy which is shown by the American people in general on the subject of the destruction of their forests. I have now crossed the continent by four different routes, and everywhere it is the same sad story. Wherever the railroads go the valuable timber is either burned or wasted, and nobody but a few of the more enlightened Americans seem to recognise that what Mr. Douglas says is true. I travelled with a gentleman of great ability, who was largely interested in lumber in the north-west, and who said that the best timber was nearly all gone in Minnesota, but that it was no use for lumbermen to try to save what was left, as the railways were burning it down a great deal faster than they could cut it. He told me that in Colorado there were no forests worth mentioning, and when I went there I found that, though from a European point of view, there were still large tracts of what we should call very valuable forest, yet fires were burning in all directions, and probably two-thirds of the coniferous timber in sight of the railroads was already destroyed. In the mountains, I learned that, owing to the exceptionally dry season, water was in places getting scarce, and that there was, in some cases, hardly enough in the rivers to supply the irrigating ditches below. At Leadville, which was surrounded by forest not many years ago, I was told that mining timber now had to be hauled 15 miles. When I went across the boundary into British Columbia it was much the same thing, though in the damper valley of the Columbia the forests are less subject to burning, and notices were posted to warn passers-by against carelessness.

At Nelson, a new mining town in the Koutenay district, I rode for many miles through what had been magnificent timber, all burned up to an altitude of about 4000 feet, except on the shady northern slopes. Along the line of the Canada-Pacific, east of Revelstoke, it is the same story, and though much good timber is still left in places, yet on the east of the Kicking Horse Pass most of it is burned, and the young trees which sprang up after the first fires are again burned. I saw new ties being put in which were not above 6 inches on the face in some cases, and would not last more than five or six years, and quite small logs floating down the rivers in thousands to supply the saw-mills. I do not suppose that anyone can form a correct judgment of what

will be the future of all this western country, but I believe that a great deal of it which is habitable now will not be so after another fifty or a hundred years of such waste.

There is, no doubt, on the Pacific coast enough good timber to supply all North America for centuries, but what will it cost when it has to be freighted so far? And what will become of the drier parts of the country if irrigation is only possible for three or four months of the year? *Garden and Forest* has done its best for five years to bring all this home to the inhabitants of the United States, but as far as I could judge public opinion in the west is not more advanced than it was in 1887, when I was last there, and it will soon be too late to save anything but the most inaccessible forests from destruction.

Last year I went to one of the principal importers of timber in Gloucester, England, to see if I could get some really first-class lumber for building Orchid-houses. He told me that such a quality as they used to have forty years ago could not now be found. It was not a question of price, as there was not any. What is imported now is cut from smaller, quicker-grown trees, and will not last. In consequence, pitch-pine is being used for horticultural buildings. *H. J. Elwes, in Garden and Forest.*

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

ACALYPHA MUSAICA.—Plants of this bronzy variegated decorative subject should be given good places in the stove, where they will get plenty of light and attention; we have nothing to beat them during the winter months for giving colour in the way of stove foliage plants, and they will stand in a cool room without injury longer than most plants.

THE FORCING-HOUSE.—Crowns of Lily of the Valley may now be potted-up for early forcing, using 5 and 6 inch pots, and putting about one dozen crowns in each pot. The soil for the purpose should be rich loam, mixed with leaf-soil and plenty of sand, with a bit of fertilising-moss placed over the crows. After potting, afford the pots a watering, and place them in a cool house or shed under dryish soil or cocoa-nut refuse-fibre. A few pots may be placed in heat at once for an early batch, and for a succession of flowers a few pots as required every week. The pots containing the crowns should be plunged in bottom-heat of about 80°, and where no proper forcing-house exists, a Melon or Cucumber-pit, with hotwater-pipes below the bed, furnished with check-valves, so that the heat may be regulated as required, will answer the purpose. Sink the pots well down in the bed, and invert an empty pot over each, covering them with soil. Examine them from time to time, and when it is found that the growth is about 1 inch high, take off the inverted pot, but leave the crowns still plunged in the bed, and afford water freely at the same temperature as the bed. The empty pots may be put over them again for a time, but without a covering of soil, and then gradually expose them to the light. The plants must be shaded during bright weather. It usually takes about one month to bring Lily of the Valley crowns into flower before January. Lily of the Valley is greatly improved by liquid manure, but it must not be given overhead.

SPIRÆA JAPONICA.—Roots for early work should be potted off as soon as possible, and plunged under cover in the same manner as Lily of the Valley; and the early batch should be treated in the same way as recommended for those, with plenty of heat and water.

BULBS.—Roman Hyacinths, Van Thol Tulips, Double Roman and Paper White Narcissus, double and single Jonquills, should be pushed along in the forcing-house; also *Deutzia gracilis*, purple and white Lilacs, *Azalea mollis*, *Polyantha* and Tea Roses, *Dielytra spectabilis*, and clumps of Solomon's Seal.

HELLEBORUS NIGER.—Clumps of this plant should be potted and placed under glass, a few pots being placed under glass for affording earlier flowers than they would appear out-of-doors. These Hellebores resent root disturbance, and do best when

potted in February, although that advice cannot always be followed.

BOUVDIAS should be fumigated with tobacco or syringed with quassia-water if any green-fly be present on them, and be afforded some liquid or other manure at times. As the Bouvardias last longer in flower, and the growth and blooms are more robust when grown comparatively cool, it is not wise to use more fire-heat than is necessary to maintain a day temperature of 55° to 60°. Plants lifted from the open ground in September are now flowering here with air on the house night and day. The variety Mrs. Robert Green, a salmon-coloured sport from President Cleveland, is worth growing; also the double pale sulphur variety *Flavescens*.

VIOLETS in pits and frames will require plenty of air night and day, removing the lights altogether on sunny days. If the soil was thoroughly watered when the plants were set out, no more water will be needed for some long time. One of the chief points in growing Violets is to plant out in the month of May strong-rooted divisions of the plants, and one of the best places for a plantation is a border on the north side of a wall or tall hedge. The ground for Violets requires to be rather heavily manured and deeply dug. At the time of planting, dig a piece sufficient for a row of plants; line it out, and plant the divisions with a trowel, and place the foot firmly against each root to make it fast in the soil, and after a row is planted, water the soil rather heavily.

ZONAL PELARGONIUMS in flower will require a temperature of from 55° to 60° by night, and 65° to 70° by day, with a free circulation of air, and they flower the best if they are kept rather dry at the roots, an occasional watering with clear soot-water doing them good.

PRIMULA SINENSIS FIMBRIATA AND **P. OB-CONICA** will need careful watering during the dark days approaching, the plants soon going wrong if over-watered. Let them have abundance of air night and day, when the weather is not frosty, avoiding fire-heat as much as possible, as it spoils the colour of the flowers, and weakens the growths. These plants should be carefully turned round once a week, and have slight shade afforded to them during bright weather.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

FRUIT BUSHES.—Where sparrows and other birds evince a partiality for the buds of Currants and Gooseberries, pruning should be soon begun, and as red and white Currants are those which suffer first from these birds, they should be the first to be pruned, the work being pushed on speedily. After the pruning is finished, the buds may be rendered distasteful to the birds by syringing the bushes with a mixture of fresh-slaked lime, fresh soot, and water, in the manner previously advised as a protection against bullfinches. In pruning the red and white Currants, a few extra shoots should be left on each bush, in case of the loss of shoots—not an unusual occurrence on bushes which have been closely pruned for a number of years. After the red and white Currants, take the Gooseberries, and in the event of getting all bushes pruned at an early date, the dressing of lime and soot may be deferred till then, when after clearing weeds off the ground, the bush quarters will look tidy for the winter. Experience only can teach the operator how to prune the Gooseberry to the best advantage, each different variety requiring different treatment; but it is requisite in all of them that some of the old branches be cut out, so that the hand may be readily inserted in gathering the fruit in the interior of the bush. Upright growers, like Whitesmith, Champagne, &c., after pruning back to the best-placed young shoots, should have the remaining shoots spurred in to 1 inch in length. With Warrington and others of a more or less pendulous habit, pruning back to well-placed diverging shoots, and slightly shortening these to a bud on the upper side of the shoot, best maintains the balance of the bushes, and furnishes them with bearing shoots.

CUTTINGS OF GOOSEBERRIES AND CURRANTS should be made and put into the earth as early as possible, and any open border that may be vacant will suit them for the first year. Cuttings should be straight shoots well ripened and firm, and as they should have a clean stem of not less than 6 inches in height

above the soil, the cuttings must be at least 12 inches, and will be better if 15 inches long, taken off near the base, but avoiding the actual base, as that part is full of buds. Having decided on the length of the cutting, leave four buds near the top of the cutting, to furnish shoots for the formation of the crown, all the rest being cut out with a sharp knife, any buds left underground result in suckers. The cuttings should have the upper part dipped in warm fresh lime-wash. In putting in cuttings, cut a trench with an upright face, and place them so that at least the upper 6 inches are above the ground-level.

THE GOOSEBERRY CATERPILLAR.—The dressing of lime and soot is a deterrent to the "caterpillar," but if the bushes were infested ever so little last spring, it is well to take other precautions; and if the bushes are planted sufficiently wide apart to admit of digging the soil deeply midway between the rows, it should be carefully shovelled away underneath the bushes where the chrysalis lies hidden, and thrown into the middle of the alleys and dug in deeply, the soil taken away from the bushes being made good from the alleys. The Gooseberry saw-fly winters not only in the soil, but in the fallen leaves, and these should be collected and burnt. Where bushes are planted too close together to admit of the above method being followed, the old soil taken from around the stems should be replaced with some from another quarter of the garden, and when that is removed, deeply trenched in somewhere else. As a further safeguard, place a handful of air-slaked lime and fresh soot, mixed together round each stem.

THE KITCHEN GARDEN.

By H. C. PRINSEP, *Gardener, Busted Park, Uckfield.*

CABBAGES.—Owing to the favourable character of the weather, Cabbages in this district have grown fast, and if this kind of weather continues, the first batch will be very forward. Those, however, who took the precaution to sow late will have little need to regret having so done. It will be good practice to plant later-sown plants between those already planted, or make a new plantation, for should the winter be a severe one, the earliest plants will suffer. If however this cannot be done, the seedlings still remaining in the seed-bed should be pricked out at 6 inches apart for lifting in the spring, if they should be wanted.

SALSIFY.—Where this is still in the ground, no time should be lost in digging up a portion of the crop, storing the roots in a cool place out of the reach of frost.

SCORZONERA.—The same may be said of this root, for although it will withstand frost, it is well to have roots in store.

RHUBARB.—Roots may be put into the Mushroom-house or other moderately warm place every fortnight. Rhubarb may be grown under the stages of an intermediate house or any place where a sufficient steady warmth is obtainable, but it does not start readily into growth at this time of the year, therefore more time must be allowed for the various batches to produce stalks.

MUSHROOM-HOUSE.—Avoid the use of fire-heat as much as possible, but when it is necessary do not let it rise higher than 60°. The beds may now be made thicker, thus retaining their heat for a longer period than is necessary in warm weather.

HERBS.—See that means are at hand to protect Chervil, Basil, and similar herbs from frost. Parsley roots may be lifted, and transplanted to where protection can be afforded them.

THE ORCHID HOUSES.

By W. HOLMES, *Gardener, Pickering Lodge, Timperley.*

ODONTOGLOSSUM CRISPUM AND ITS VARIETIES.—Of the above we might include those natural hybrids, *O. Andersonianum* × *O. Ruckerianum* ×, and also *O. Hallii* × *O. triumphans*, *O. Pescatorei*, and *O. gloriosum*. Any of these varieties if potted or top-dressed at the time advised in a former Calendar will have become re-established, and the sphagnum moss in free growth; but should the latter grow too abundantly it should be thinned a little, or more moisture than would be good for the plants will be kept about the base of the pseudobulbs. The well-being of these plants is best maintained by allowing the compost to become dry occasionally,

and it is better practice to afford water often than to keep the materials always moist. If an *Odontoglossum* which has been repotted is not doing well, perhaps by reason of the compost becoming sour, turn it out and repot it. Those plants that were repotted in September may now be pushing up flower-spikes, and they will be benefited by being deprived of them, soon making another pseudobulb stronger and better able to carry a strong spike. I cannot say that I put this in practice in every case, and I do not advise others to do so, but I give it as pointing a way to making strong spikes. Plants that were merely surfaced will be showing flower-spikes, and these should be allowed to come to perfection, as the pots are filled with roots. Our plants are throwing up much stronger flower-spikes than usual, these being from twelve to twenty flower-buds on a spike. Snails do much harm among the flower-spikes of *Odontoglossums* at this season, and must be diligently hunted for about 7 p.m. or earlier. Some persons are satisfied by setting bran about for the snails to feed upon, but hunting for them is the better plan. Keep up a steady temperature of 50° at night, a moist atmosphere, and afford continuously fresh air, which will insure them to the severe weather at a later part of the season, and should early frost occur, much less moisture will be needed. The roof glass must be kept very clean, and especially if the house is near a smoky town the washings must be frequent.

PLEIONE LAGENARIA AND P. WALLICHIANA.—Plants about to finish flowering may be kept rather dry than moist for a week or two. *Calanthe Veitchii* and *C. vestita* will require a good deal of attention in watering whilst the flower spikes are rising, and the longer time the leaves can be retained the finer will be the flowers, and the longer the spike. Too much water should not be afforded, but just enough to keep the soil moist.

FRUITS UNDER GLASS.

By M. TEMPLE, *Gardener, Carron House, Falkirk, N.B.*

PINERY.—Plants from which the fruit is cut should be afforded water, in order that the suckers may grow to a good size before being taken off at the end of the year. Strong suckers may be readily grown into robust plants, but they always suffer by remaining on plants after healthy growth has ceased, and it is better to pull them off the old plants, and pot them firmly into well-drained 6 or 7-inch pots, putting a small quantity of pounded charcoal with the potting soil. They should be plunged into a bottom-heat of 75°, water being very carefully applied till roots form. A trifling amount of air may be let in by the upper lights or ventilators, and the pipes made warm enough to prevent moisture condensing on the woodwork and glass, but no more fire-heat should be used than is needed, and allowing the temperature to fall if the weather should become severe.

LATE VINES IN POTS.—It is not unusual for Vines in pots which have made fine canes, and showing signs of ripening by the bark becoming brown, to be placed against open walls and hedges; now I think that such treatment is not conducive to first-class fruiting. Let such Vines have a dry atmosphere with the lights opened more or less every day, and in the North some amount of fire-heat, affording just enough water at the roots to keep the roots in a healthy state. If the canes have not been stopped at the point at which they are to remain for fruiting, it should now be done, and the foliage well exposed to the sun till it begins to drop off. When buying Vines in pots for early fruiting, it is well to ascertain how they have been ripened off, if by a check from cold they are likely to be in a bad condition.

STRAWBERRIES.—As the ripening of the crowns is of great importance, and a sodden soil is not conducive to that end, the pots should be turned on their sides during heavy rains, and the plants stood wide apart at other times. Do not let them root into the gravel, coal-ashes, &c., on which the pots are standing, and if they are placed in glass structures at this season, there must be no coddling, but abundance of air afforded at all times when it does not freeze hard. Plants for early forcing should always have some kind of protection placed over them to throw off rain, and by inducing rest, by a rather drier treatment, they are better got in order for forcing gently in the beginning of the month of December, although little good results from forcing the plants before the end of that month. I have forced Black Prince into fruit to supply small gatherings at Christmas, but such efforts seemed

wasted labour. Plants which were planted early in the season in a good position, and which may be showing bloom, may be lifted, and brought on slowly under glass if fruit is required at the end of the year. It may here be stated that plants which were forced last season, if they have been kept in pots, can be easily fruited at the time indicated by placing them in a temperature of 50° to 60°.

TOMATOS.—Plants which may be fruiting in cool unheated houses may be relieved of all their fruits, when these are of fair size; complete ripening being brought about by putting them in a warm dry place. Young plants growing in warm houses should have as much air as can be safely afforded, and be freely exposed to the sun. Well-rooted cuttings or seedlings may be shifted into pots 2 inches wider than those in which they have rooted—not larger, or rank growth not favourably fruiting will be made; still, a starvation treatment is to be avoided.

THE FLOWER GARDEN.

By T. H. CRASP.

THE HERBACEOUS BORDER.—The weather being generally favourable for work out-of-doors, attention may be turned to the herbaceous border, the plants in which are much better for being divided and reduced in size every few years, and most of these plants enjoy a liberal dressing of manure, which cannot be very readily dug-in without a general overhauling of the plants, and such work may be done now rather than in the spring when there is so much to be done, moreover the plants are then better able to withstand frost and the drying winds of spring. In the first place, take up all the plants for a certain distance along the border and lay them in, so that frost cannot harm them, then dress the border liberally with decayed manure, and dig it deeply. Let it lie untouched till dry enough to tread upon, then level and tread it all over, raking it roughly. The roots should then be divided and sorted according to the height they attain, the colour of the flowers, and the variety. After planting, afford the border a mulching of partly-decayed leaves or stable litter to protect the plants from frost.

LAWNS.—These do not require much attention beyond sweeping and rolling, and a close mowing for the last time. Most lawns are benefited if at this season a slight dressing of some finely-sifted fertilising material be afforded. Do not allow tree-leaves to accumulate in corners of fences, or anywhere on the lawn, as much labour will be caused by the worms drawing them into the turf. Walks should be regularly rolled at this season once a week. In order to get the outdoor-work well in hand, Box-edgings may be planted; in fact, the work of laying may be more expeditiously done than in the spring, and the plants have a better chance of getting established. The pruning of many species of shrubs, which were not pruned after flowering, may be commenced, and all transplanting operations should be pushed on with in mild weather. Flower-beds may be cleared, and all planting of spring flowering plants and bulbs finished. The edges of the beds may be clipped, and beds that are to contain flowering plants should have a good dressing of decayed manure or leaf-soil dug in before planting them. Dahlias, Cannas, Gladiolus, Salvias, &c., should be dug up and stored away in a dry shed from which frost is excluded. Briar-stocks may now be collected and planted, first trimming them hard, and removing any rough shoulders or knots. They may be planted about 6 inches deep, 18 inches apart, with a 3-foot space between the rows.

FRUIT NOTE.

APPLE BALDWIN.—Trees of the above variety are seldom seen in this country, but calling at Orton Hall Gardens, near Peterborough, a few days since, I noticed a low standard Baldwin carrying a very heavy crop. Mr. Harding, the gardener, speaks very highly of its good-keeping, cropping, and generally useful properties. I have since heard that he gathered thirty-five stones of Apples from this tree, which was grafted by him only eleven years since on an old stump of a worthless variety. It has been grown without any shortening of the branches of late years, and has now a fine large head. The variety does not resent pruning, as two other trees at a short distance from it are kept in bush form, and these also bear heavy crops. *W. H. Divers, Ketton Hall Gardens, Stamford.*

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

TUESDAY,	Nov. 7	}	National Chrysanthemum Society, at the Royal Aquarium, Westminster (three days).
			King-ton and Surbiton Chrysanthemum (two days).
WEDNESDAY,	Nov. 8	}	Brighton and Sussex New Horticultural and Chrysanthemum.
			Southampton Chrysanthemum.
			Watford Chrysanthemum.
			Devizes Chrysanthemum.
			Bath Chrysanthemum (two days).
THURSDAY,	Nov. 9	}	Bournemouth and District Chrysanthemum (two days).
			Torquay Chrysanthemum.
FRIDAY,	Nov. 10	}	Croydon Chrysanthemum (2 days).
			Chichester and West Sussex Horticultural (two days).
FRIDAY,	Nov. 10	}	Tiverton Chrysanthemum.
			Windsor, Eton, and District Horticultural and Chrysanthemum.

SALES.

MONDAY,	Nov. 6	}	Dutch Bulbs, at Protheroe & Morris' Rooms.
			Plants from Belgium, Roses, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.
TUESDAY,	Nov. 7	}	Dutch Bulbs, Liliiums, &c., at Stevens' Rooms.
			Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY,	Nov. 8	}	Mr. T. S. Ware's Great Annual Sale of enormous quantities of Nursery Stock at the Hale Farm Nurseries, Tottenham, by Protheroe & Morris.
			Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	Nov. 10	}	Plants, Palms, Lilies, Narcissus, &c., at Protheroe & Morris' Rooms.
			Important Sale of Nursery Stock at The Nurseries, Toddington, Winchcomb, Glos., by Protheroe & Morris (two days).
SATURDAY,	Nov. 11	}	Roses, Plants, &c., at Stevens' Rooms.
			Dutch Bulbs, at Protheroe & Morris' Rooms.
SATURDAY,	Nov. 11	}	Orchids, at Protheroe & Morris' Rooms.
			Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—43° 9.

WE are now well into the great Chrysanthemum season, and in the course of another week will be held hundreds of exhibitions that this indispensable flower has called into existence. Our columns will be burdened with Chrysanthemum lore, and most gardeners, whether one meets them at home or abroad, will have but one main topic of conversation. It is marvellous the position of importance this flower has attained, and it cannot be explained by saying that it is merely the result of a fickle fashion, which may soon be transferred to another and altogether different kind of plant, although some of its success may no doubt be attributed to such a circumstance. The Chrysanthemum has, however, two very important and lasting points in its favour, which have been more responsible for its present position than any other reason. The first of these is the wonderful merit undoubtedly possessed by the plant itself, which could be easily illustrated by referring to its adaptability for decorative purposes, to its extreme floriferousness, or to the simple treatment that it requires when compared with many other plants which require shelter during the whole year. Nor would we forget the boon it is to the towns, for here is one of its chief recommendations; the displays that we have seen in our parks, nurseries, and in some private collections, almost in the centre, and certainly in some situations in London most inimical to plant-life, are truly wonderful.

Then the other great point in its favour is that it blooms when flowers of any kind are most appreciated. In the dreary month of November it creates a floral blaze such as we hardly see surpassed during any portion of the year. It is not so remarkable then, after all, that the Chrysanthemum should maintain the proud position to which it has attained.

At the present date, after seeing many of the best collections near London, and noting the interest and enthusiasm manifested by its patrons, it appears that the field over which it reigns is wider even than ever.

After such a remarkable summer as we have had, the question would naturally arise, "Has it been favourable or otherwise to the production of exhibition blooms?" The extreme hot and dry weather has been prejudicial in cases where the staff of labour has been rather under than over what it should have been, because the plants have suffered from too sparse attention in regard to watering, but where this has not been neglected, the season has apparently been favourable. It is likely that the show of the National Society and others to be held next week, will prove this to be one of the finest Chrysanthemum seasons ever experienced. The only complaint we have heard has been in reference to the incurred section, that in some cases the blooms are not so large or well-formed as usual, whilst in others where they are considered well up to average they are a little late, and will probably be just a little behind the great shows. However, this trouble will most likely heal itself as the days pass, and the lovers of this section may not be disappointed.

In regard to the different classes of flowers, it is obvious that the Japanese are still the most showy and the most popular. The incurred and perhaps stiffer-looking flowers are plainly dropping out of a great number of collections, and are hardly ever to be found in quantity, except where required for exhibition. The Anemone section seems rather neglected, and this is difficult of explanation, because the flowers are equally attractive, as are the Japanese, besides adding variety to the collection. Pompons are extremely popular with the general grower, and deservedly so, for their decorative qualities are unequalled.

Novelties are still produced in great quantity, and this year will see many very fine additions to the Japanese section particularly, and to the other sections in a minor degree. The American seedlings continue to give the most novelty, and a greater number of seedlings are raised by home-growers than was ever done before. Reference to many of the newer varieties will be made in another column. Improvement mostly occurs in colour and in refinement of bloom; but we must not forget that several of the American seedlings we have seen bid fair to rival the great Etoile de Lyon in size, but at the same time being very much better in form and finish.

The fruit crop and its results.

RECENT communications to be found in the "Correspondence" columns of this and other journals, as well as conversation with growers for market, point to the fact that a good many growers of fruit for the London market have found this to be a "minus" year, and try to saddle the blame on those who, in many instances, do not deserve it. Apples and Pears, of good, bad, or indifferent quality, have been put upon the metropolitan markets apparently without any consideration as to time place, or price; and because a good result for the grower has not been achieved, all the blame is

placed on the shoulders of the salesmen. It is no rare thing just now to find exposed on costermongers' barrows, at a penny a pound, fruit which a month hence could easily fetch, about treble the money. The salesman must part with his goods, but the grower would have done better by giving them to his pigs. By and by, the man who knows how to keep, and does keep, his fruit, will reap a good harvest—his "reckoning" will once more prove the value of common sense. Nor is it every grower who knows how to pack fruit for market; this work is often done in a disgraceful manner, making one cry "shame," at sight of fine samples, as it were, maltreated by the packer. Such growers and such packers should really be packed off out of the trade—they hurt everybody in it. Again, fruits from our Colonies and Possessions often come to hand in sorry plight; in the early part of the past season, as we noted at the time, many wrecked samples of Grapes were put upon the market at ruination prices, but they were worth no more; and Apples and Pears, mostly the former, came to hand as if they had been baked. We do not think any enterprising barrow-man was tempted to take them at a gift, as in former days was the case with a consignment of Italian Cauliflowers. A show at the Imperial Institute in early season days showed some of the "reasons why" of faulty consignments, noted at the time in our columns. True, since then, many splendid samples have been placed on the market, which may have had considerable influence in making up the final reckoning. It is astonishing to note how very much the errors of China prevail in Peru; how the Press at the Antipodes try to teach growers for export how and what to grow, how to pack and carry. In time, possibly, our colonial friends will have picked up all the wisdom necessary; if it be any comfort to them, they have the knowledge that there are people in the "old country" still "going to school" at a heavy expense.

We have said that the colonial press does its duty in the matter of teaching, as does the press at home. In days to come, perhaps district and parish councils will find most profitable work in directing the gathering of all sorts of horticultural and agricultural produce, and finding a paying market for the same—not necessarily always in London. We may anticipate a very large increase in the number of allotments taken up and cultivated by the labouring classes—the number would certainly be greatly increased by the action of a body akin to the proposed district councils; and much of what is now grown and marketed at a losing figure might be so "placed" as to satisfy the grower, and act as an encouragement to those who desire to carry surplus labour from town to country. Surely, then, after-harvest reckonings will be more in favour of denizens of the home land than of those separated from us by a strip of sea who load our markets with every possible kind of food products.

PAPHINIA GRANDIS (fig. 93, p. 561).—The Paphnias form a pretty genus, of which but few species are at present in cultivation. In *P. grandis*, the largest and most beautifully coloured of the forms of Paphinia cristata (which is also known as *Lycaste cristata* and *Maxillaria cristata*), we have a species with large flowers, whose petals and sepals are of a creamy-white colour, with intense blackish-purple spots; the column of a pale yellow, and spotted with purple; the lip white and fringed. The plant from which our figure was taken was shown by Messrs. LINDEN, L'Horticulture Internationale, Parc Leopold, Brussels, at the meeting of the Royal

Horticultural Society on the 24th of last month. Paphinias do best in the East India-house in pans or baskets filled with sphagnum moss, peat, and charcoal.

NATIONAL CHRYSANTHEMUM SOCIETY.—The annual dinner of the above society will take place at Anderton's Hotel, Fleet Street, E.C., on Thursday, November 30, at half-past six p.m. sharp. Sir

Windsor, in the rooms of the Horticultural Club, by kind permission of the members, on Saturday, October 28, MARTIN R. SMITH, Esq., President of the Society, in the chair. The President, Vice-Presidente, committee, and office-bearers, were re-elected. It was decided to hold the exhibition for 1894 under the auspices of the Royal Horticultural Society, on July 24, 1894. The following alterations were made

of the Society, and it was decided to offer prizes for the best seedlings raised from the seed so distributed in the year 1895. The statement made by the Treasurer showed that the Society was financially successful. The subscriptions as per list amounted to £154 9s. 6d. The amount received for special prizes was £18 17s. 6d.; prize-money distributed, £99 15s. 6d. The balance from last year was

FIG. 93.—PAPHINIA GRANDIS. (SEE P. 560.)

EDWIN SAUNDERS, President, will take the Chair. The Challenge Trophy, Holmes' Memorial Cups and Medals will be presented to the winners during the evening. Members are earnestly requested to make the dinner a success by an early application for tickets, and by disposing of the same to their friends. RICHARD DEAN, Hon. Secretary.

NATIONAL CARNATION AND PICOTEE SOCIETY (SOUTHERN SECTION).—The annual general meeting of the above Society was held at the Hotel

in the schedule:—Two new classes were added of twelve blooms and six blooms respectively, with a growth from the plant to each bloom, and without dressing. It was also proposed, and unanimously adopted, that the class for yellow ground Picotees be judged on the same principle as the white ground varieties; that is, a pure yellow ground with a margin the same as the white ground class, fancies excluded. A distribution of seed has been made to the members applying for it, saved from choice fertilised flowers grown in the garden of the President

£65 10s. 5d.; and the balance at present in the hands of the treasurer is £118 5s. 4d.

ANNUAL MEETING OF THE AURICULA AND PRIMULA SOCIETY.—Held on Saturday, Oct. 28, at the Hotel Windsor, Mr. HENRY CANNELL, of Swanley, presiding. The President, Vice-presidents, committee, office-bearers, &c., were re-elected, the name of J. T. BENNETT-POË being added to the list of Vice-presidents. It was decided to hold the exhibition for 1894 under the auspices of the Royal

Horticultural Society as heretofore, and to offer the same schedule of prizes as last year. The subscriptions, according to the list, amounted to £63; prizes paid, £60 16s.; other expenses brought the expenditure up to £74 1s. 6d., leaving a deficit upon last year's working of £8 16s. 6d., due to the treasurer. If all the members would pay up their subscriptions, this deficiency would be materially reduced, and, with a very little effort on the part of the members, there might easily be a handsome surplus.

A CHRYSANTHEMUM SHOW AT KETTON HALL.—By the kind permission of Mr. and Mrs. Hopwood, the gardens and hothouses at Ketton Hall, near Stamford, will be opened to the public on Thursdays, November 2, 9, and 16, at a charge of 6d., from 2 to 5 P.M., in aid of the Royal Gardeners Orphan Fund. The Chrysanthemums are now in flower, and more than 1000 large blooms in various stages of development are to be seen.

ORCHID CULTURE IN BELGIUM AND IN ENGLAND.—The *Journal des Orchidées* for October 15 contains an article by M. LUCIEN LINDEN, in which he compares the English and Belgian methods of growing Orchids. He says of us, that "Our neighbours are, as is well known, excellent growers of Orchids. The splendid specimens and the admirable show of bloom in the collections of the principal English amateurs afford sufficient proof of this. At the same time, I have been struck with certain differences from our methods of treatment, which I consider show the superiority of the Belgian method of cultivating Orchids. The chief difference seems to me to consist in the deficient supply of air and light, and to my mind this is of great importance. In the second place, the plants are usually too dry. Many Orchid-houses in England are half-span, consequently badly lighted and insufficiently ventilated, even those where *Odontoglossums* from the Cordilleras are grown, though these especially require free circulation of the air. The ventilators are too few, too small, and evidently are hardly ever opened. I have sometimes seen them formed of perforated zinc, through which hardly any air passes, and sometimes too little top air is afforded. Almost everywhere I noticed a most objectionable custom, that of covering the stages with a thick layer of coke or charcoal, instead of using open-work stages, which allow the air to circulate between the pots. I also observed an excessive temperature in many houses, especially in those devoted to *Odontoglossums* and *Masdevallias*. Many growers pay too little attention to the supply of light; their houses are darkened, frequently with a rather thick blind. Our lattice-work screens temper the light, and are much to be commended. English growers trust entirely to the resting-season to ripen their plants, and they attach so much importance to this period, that they keep their Orchids extremely dry even during their growth. In England there is not seen that vigorous growth which is shown in plants grown according to the Belgian methods. Orchids are less green, have fewer roots, and have much more slender floral stems. The Belgian cultivators water much more, and give a less long repose, but especially they give more air, and it is chiefly—as M. VAN IMSHOOT remarked before me to an English gardener—air which ripens our plants. M. CAUZAC has also recently drawn a comparison between the English and the Belgian gardener. The Belgian gardener is a more zealous worker, a most attentive observer of the thousand little matters of detail which the inexperienced would consider trifles, but which are really of great importance, he has more thought and interest, he varies his methods, has better taste, and he more readily adopts novelties, but he has not the patience, the trustworthiness (*solitude*), or the punctuality of the English gardener; the latter also knows the names of his plants better, has a better manner, is more particular in his dress and appearance; and is, in short, better educated."

THE GREAT YORKSHIRE GALA.—The annual balance-sheet for 1893 shows a steady increase of funds to the credit of the committee, there being a

reserve fund of £2000, with a further sum of £256 to their credit. The receipts at the gates for the three days amounted to £1850, and from other sources £524 10s. During this year, £250 was given to the York charities, £614 12s. paid in prizes and to judges, £115 12s. for bands, £340 for tents and other fittings, and over £300 in other amusements incidental to the exhibition.

THE GARDENERS' ORPHAN FUND.—A meeting of the committee took place at the Horticultural Club on the 27th ult., W. MARSHALL, Esq., in the chair. The minutes of the last meeting having been read, the secretary reported that the sub-committee appointed to act during the recess, had drawn a cheque for the quarterly allowances due to the children on the Fund, on October 1 last. The following special receipts were announced:—Mr. W. Elphinstone, The Gardens, Shipley Hall, Derby, opening the gardens during the summer months, £11 1s. 6d.; Mr. J. H. Vallance, local secretary, Bristol, legacy by a deceased lady, £3 3s.; Mrs. Bowerman, Hackwood Park, sale of flowers, £1 6s.; Mr. J. Plowman, Woodstock Gardens, Long Sutton, box, 10s.; Mr. G. Tubb, Minley Manor, Farnborough, box, £1 2s.; Miss Barron, Sutton Court Road, Turnham Green, box, £1 11s.; Mr. F. A. Burbury, Highbury, Birmingham, box, £1 16s.; Mr. J. B. Stevenson, Church Cottage, Bourne-mouth, box, 6s. 5d.; and Mr. C. Sutton, The Gardens, Chevening Park, Sevenoaks, 6s. 6d. The secretary reported the receipt of a cheque for £100 from Mr. N. Sherwood (Messrs. Hurst & Sons), as a jubilee celebration gift by the firm; and a hearty vote of thanks was passed to this generous supporter of the Fund. The chairman reported the death of Mr. Hugh Low, of Clapton, a member of the committee, and a resolution of condolence with Mrs. Low on the great loss she and the committee had sustained, was passed by acclamation. The proceedings closed with a vote of thanks to the chairman.

—What was correctly described in the programme as a grand concert was given at the Surbiton Assembly Rooms, on Wednesday evening of last week. There was a large attendance on the part of the public, and the programme so very admirably provided by Mr. W. FURZE of Teddington, was carried out in the most efficient way. During the evening a very handsome bouquet, most kindly sent for the purpose by the eminent florists of Forest Hill, Messrs. J. LAING & SONS, was by the Secretary, Mr. A. DEAN, presented to the Mayoress of Kingston, in recognition of the Mayor and Mayoress's kindness in giving their patronage to the concert. The large committee of gardeners of which Mr. OSNORN is chairman, and Mr. E. BENNETT vice-chairman, and Mr. FURZE is Treasurer, met on Saturday evening and found after paying all expenses that there was left the handsome sum of 21 guineas, to hand over to Mr. BARRON. The Duchess of ALBANY kindly sent a donation of 20s. to the Fund.

BRUSSELS BOTANIC GARDEN.—On the occasion of the recent visit of H.M. the King of the BELGIANS to the Brussels Botanic Garden, many very successful sculptural decorations were arranged by MM. CHARLES VANDER STAPPEN and CONSTANTIN MECIERIES. The statues, and many of the plants surrounding them, were symbolical, as well as merely ornamental; and, to add to the effect, the fountains, which had been re-arranged and much altered, were in the evening lighted by the electric light. The scheme was as well carried out as it was ingeniously and artistically conceived, and the result was an entire success.

A SECOND CROP OF PEAS IN SIX MONTHS.—A letter from a person residing at Beverley has been forwarded by Messrs. J. CARTER & Co., Seed Merchants, High Holborn, which contains the rather uncommon intelligence that the writer of the letter in question had gathered from plants, the seeds of which were sown in March, 1893, other seeds which were sown as soon as pulled, and these latter had produced plants from which excellent Peas were

gathered for the table during the last month. The variety was Carter's Lightning; and of the goodness of the Peas we can vouch, Messrs. CARTER having sent a sample to this office.

DEVON AND EXETER GARDENERS' ASSOCIATION.—At a meeting of this Association, held on the 25th ult., a paper, entitled, "Plant Names and their Associations," was read by Mr. ANDREW HOPE. In commencing, Mr. HOPE said that plants have histories and pedigrees that are interwoven with our daily life, our country's history, our customs, and our superstitions. Historic plants and national floral emblems were next described, and their traditional origins enumerated. After referring to symbolic plants, the origin of British plant names was considered, the lecturer declaring that many plants were now known by names the outcome of a graduated course of error and corruption. Local plant names, botanical names, Latin and Greek names, formed further interesting sections.

LEAVES DEVELOPED IN THE SUN AND IN THE SHADE.—Considerable differences are produced when leaves are developed in the shade instead of in the sun, other conditions, such as soil, moisture, &c., being the same. All the vital functions are carried on more energetically in those leaves which are produced in the sunlight. They transpire more abundantly than those produced in the shade, and contain relatively less water; but the circulation is more rapid, and they receive a larger quantity of nutritive substances. Besides these differences, leaves that are grown in the sun are thicker, and carry on a more active respiration, and since they contain a larger quantity of chlorophyll, their assimilation is also more active, and they fix a larger quantity of carbonaceous matter. *Rev. Gén. de Bot.*, iv., p. 481.

LIGHT AND FLOWERS.—The action of light on flowers has always been a fascinating study, and many experiments have been made by which plants have been grown under glass of various colours. Amongst the latest researches in this direction are those of M. C. DE CANDOLLE. He exposed specimens of *Tropaeolum majus* and *Lobelia erinus* to the action of light, which had previously passed through a solution of chinchonine sulphate, and had thus been deprived of all rays except the ultra-violet rays. He found that these ultra-violet rays have the effect of greatly stimulating the formation of flowers, but that they are not essential to their development. Further particulars of these experiments may be found in the *Arch. Sci. Phys. et Nat.*, xxviii., p. 265.

SYNANTHY IN ORCHIDS.—Congenital union of two or more flowers is of common occurrence when growth is rapid, and when the buds are very closely packed and pressed upon in the young stage. When this happens, the two flowers become welded into one, some of the flower-segments being usually squeezed out of existence, so that though there may be two flowers concerned, the number of parts present is less than would be the case in two separate flowers. We owe to the kindness of Sir TREVOR LAWRENCE a specimen of *Cypripedium* "conco-Laur x," in which there are three sepals, two upper, one lower; three petals, one median, two lateral; and two lips. The column also consists of two blended, and more or less distorted. The ovaries also show traces of fusion. A similar Composite flower of *Cattleya Bowringiana* shows traces of the union of three flowers, the whole forming a confused mass of segments, with three lips, and as many stamens.

REBUILDING OF CHERKLEY COURT, LEATHER-HEAD.—Cherkley Court, Leatherhead, the magnificent residence of Mr. ABRAHAM DIXON, which was recently destroyed by fire, is now being rebuilt as quickly as circumstances will allow, says the *Builder*. Cherkley Court was, before the disastrous fire which broke out in consequence of the house being struck by lightning, one of the finest residences in the south of England, and commanded a varied

and extensive view over the Mickleham, Box Hill, and Ranmore common. The main part of the house was utterly destroyed by the fire, and almost the only part saved was the fine conservatories, which were practically uninjured. The rebuilding has been commenced, and is now being rapidly pushed forward. The work has been entrusted to Messrs. HOLLANDS & HANNEN, of London. The plans for the restoration of the house have been prepared by Mr. CHAMBERS, architect. A careful examination of the burnt-out building revealed the fact that some of the walls of the house would have to be taken down, though a great part of them were uninjured by the fire. It is hoped that the work will be completed by the end of May. A large staff of men is working day and night to repair damages, the electric light, with which the house was fitted, being used for the night work.

IMMENSE HEADS OF CAULIFLOWER.—There were recently on view at Mr. T. WALMESLEY'S, the City Seed Stores, Lichfield, some very fine specimens of the above, one extraordinary specimen measuring 60 inches in circumference, the curd being very close, and pure in colour. The plants were grown by a Lichfield market gardener, and the variety is Autumn Giant.

HORTICULTURAL LECTURES IN S. WALES.—On Thursday, October 26, at Reynoldstone Gower, S. Wales, Mr. W. MILNER, gardener at Penrice Castle, read a paper on "Hardy Fruit." This is the first meeting of the kind which has been held in the district, and it was largely attended. Mr. MILNER, who is the Secretary of the Association, has arranged to give a series of lectures on matters connected with gardening throughout the district during the winter. The next lecture will be one on "Cottage Gardening," by Mr. T. H. CRASP, of Clyne Valley Nurseries, Swansea.

CHRYSANTHEMUMS ABOUT LONDON.

FINSBURY PARK is the most northern of any of the parks we have visited; and there can be no hesitation in advising an early visit, whilst the Chrysanthemums are at their very best. This display, whether judged on the whole, or in regard to the individual plants, can be placed second to none. The plants are not arranged so closely as is usual, and instead of the sloping bank, so universally common, the groups are much less formal, and their height varies along the whole length of the house—an advance towards a more natural arrangement. The groups each side are faced with a good belt composed of the Pompon varieties, and where pots might have appeared ugly, some Aucuba japonica had been used as a screen. The colouring too, had been studied closely in the arrangement, and the best results to be obtained from the "much-mixing" method was to be seen; but we confess to prefer the "grouping" system, where a few plants of one colour, or of one

variety preferably are placed together, and then the groups arranged with as much care as to harmonize or contrast as is used now. A good span-roofed house has been built since last season, good in many respects, though it might have been better had the gardener been allowed to design his own requirements, as he should be, instead of the whole being settled by the Architect Department at Spring Gardens. Its dimensions are 95 feet long, by 30 feet wide; and, as far as might be judged on the spot, about 25 feet high, very much higher than necessary or convenient for a house in which to bloom Chrysanthemums. In this house are about 2600 plants, embracing about 300 varieties, which include twenty-four new ones that have been added since last season. The plants are very well grown, thick, with good foliage, and the foliage well retained to the base. It is quite impossible to mention all the varieties that are worthy of note, as most of the flowers are quite exceptional in size and quality. Among the newer ones we noticed at their best are George W. Childs, a very rich purple-crimson Japanese; Beauty of Exmouth, large and rather flat blooms, white, with curiously crimped florets; W. A. Manda, and others will be better a week later. Val d'Andorre is very well done, and Florence Davis also will be capital in a few days; Miss Anna Hartshorn, white, and Mons. Tarin, pinky Heliotrope, are both among those much admired. The old white Elaine was as well done as any of them, and it and Eynsford White are not the least attractive of this section. Col. W. B. Smith is not quite as good as it might be, but Edwin Molyneux, Cæsar Costa, a fine purple-crimson; Louis Bohmer, and Duchess of Devonshire, the latter a large white Japanese tinged with rose upon each floret, were all good. The Anemone section is chiefly represented by Delaware, white with yellow disc; and Mrs. Judge Benedict very similar in colour, the disc being also very large and full. Those of the incurved section will be more prominent when these notes are printed, at present they are not quite at their best, and amongst the excellent flowers of Japanese do not make themselves particularly evident. Mr. Melville and his foreman deserve much commendation for their efforts, which have met with so marked success. Finsbury Park is the name of the nearest station, and by means of a tram running from thence, the visitor can ride directly up to the Chrysanthemum-house.

WATERLOW PARK.

From the pleasant position in which this is situate, and the undulating character of the ground upon which the park has been formed, a visit may be made with pleasure and interest. It is easily reached, either by taking an omnibus to the Archway Tavern, Holloway, or by proceeding to Upper Holloway station on the Midland. A short walk up Highgate Hill from these places will soon reveal the entrance to the park, which is almost upon the top. Beside the attractions noticed above, a very nice display of Chrysanthemums has been prepared, and is now exhibited in three lean-to vinerias, from which the fruit has been almost removed, though not entirely, and a small greenhouse. The superintendent (Mr. Curle) has not had quite the same conveniences for growing this collection as are enjoyed in some of the larger parks, and it would be unfair therefore to criticise the plants. Until the plants are placed out-of-doors in the spring, there appears to be no other place than under the Vines in which to keep them, and this is not by any means a suitable position. However, the spirit of emulation that is so manifestly noticeable among the growers of Chrysanthemums in the parks, has been quite sufficient in this case to induce the gardener to make the best of the advantages he has. There are some 2000 plants, and they are necessarily placed very closely together. Beauty of Exmouth, J. Shrimpton, and William Seward are among last year's acquisitions that have been secured, but these were not in the best form, and it was among the older varieties that were to be seen the largest and best blooms. Bouquet des Dames was one of these—the blooms were exceptionally good, large, and full. A

plant of Albéric Lunden also had three first-class blooms of capital colour. Alice Bird is a good decorative variety of golden-yellow, and Sunflower, that perfection of same colour, was also in fine condition; Avalanche, Vivand Morel, Edwin Molyneux, Lady Selborne, and Avalanche should also be included among the Japanese, quite worthy of notice. A very good variety of the Anemone section is Mons. Charles Lebosqz; the flower is of good size and form, colour orange-yellow. The incurved section was well represented, and perhaps we ought first to mention the two old varieties George Glenny and the golden variety of same, whilst Mr. Bunn and M. R. Bahuant were also to be seen giving good account of themselves.

CHRYSANTHEMUMS AT DOWNSIDE, LEATHERHEAD.

It was a fortunate circumstance that Mr. W. Lee's charming place at Downside, once so famous for its grand collection of Orchids, should have come into the possession of Mr. A. Tate, who has great fondness for flowers, and prizes a garden highly. Hence we may now see there a splendid collection of Roses grown in great numbers, and on a big area of grass in front of the house, an area that even now is being constantly added to. These are specially Mr. Tate's flowers, but all the same he has great liking for Chrysanthemums, and in that respect he is well seconded by his able gardener, Mr. Mease, who has become one of our best growers and exhibitors; and, indeed, is almost one of the oldest, for was he not a great Liverpool grower ere many others of to-day had got out of their teens. Just now there is a very fine show of bloom in a large span-house, where to enable the flowers to be seen to full advantage because they stand up near the glass, a raised pathway is formed all round the house. Of course, Japanese varieties constitute the earliest and most attractive elements in the collection. Later, the incurved forms will be in fine condition. Last year Mr. Mease had at Wimbledon what was admittedly one of the finest lots of these seen all the season. He is not just now quite so expectant with regard to those incurved as last year, for the flowers are both rather lighter in material and later, but it seems impossible that some ten days hence there will be wanting very fine and perfect flowers. Of course, a little pushing on in heat may be tried, but Mr. Mease realises that this is always done at the expense of colour, refinement, and finish in the flowers.

Of incurved forms, M. A. Bahuant is in grand form, so also is Robert Cannell, John Doughty, Lord Alcester, Violet Tomlin, Baron Hirsch, Miss Coleman, The Empress, and Princess Jaculier; indeed, all the best incurved grown are here in various stages of development. A very marked flower is Noel Praguel, really a striped Empress of India; the flaking is thin, and not particularly visible at a little distance, but there it is on every petal, and it suffices to make the variety very distinct; the flake colour is apparently reddish-purple.

But the Japanese are in grand form, some flowers being truly wonderful, not merely in size, but in substance. This does not assume that they are superior to other flowers, but they are at least very fine. Not nearly so large as some of the new ones, but a singularly perfect and beautiful flower is the new Japanese incurved Robert Owen; this is flattish in form, the outline complete, the colour a very rich gold, free from shading, and it is, indeed, a truly striking and attractive variety. But of spreading forms, Beauty of Exmouth bids fair to make one of the flowers of the season; it is large, full, pure white, and fully justifies Mr. Godfrey in his contention last season as to its great excellence. Charles Rey has broad flattish flowers, not unlike Louis Bohmer, minus the hairs. G. E. Schwabe bears out its reputation of last season for bulk; W. H. Lincoln is very large, and of such a glorious yellow; Lord Brooke is of the Robert Owen form, much less striking, but still a perfect golden-bronzy flower; Vice-President Darquier, reddish-pink; and Vice-President Audiguier, reflexed pink, seem to be sports one from the other, the new golden-

bronze Viviani Morel; Charles Davis is well represented here, indeed, it is rather of a reddish-bronze. All the same, it can hardly make so striking a flower as does its grand type. That is, of course, in abundance and finish. The new crimson, W. H. Seward, promises to be the finest of its telling colour, and we should like to see these dark hues increased, for the bronzes are becoming too numerous. Excelsior is a fine reflexed form, the petals magenta, with white reverse. Colonel W. B. Smith, Stanborough Dibben, Sunflower, Eynsford White, Stanstead White, Albéric Lunden, E. Molyneux, with many others of older date, are all in fine condition. A very rich yellow reflexed is Edwin Beckett, but it will only make a front-row flower. One of the biggest new flowers is Mrs. Harman Payne, blooms 10 inches across, petals rosy-magenta, with white reverse. Eda Prass is another monster, colour pale pink or peach. On one plant that got accidentally broken down in May last, and new growths had to be taken, there is now at just over 3 feet in height a couple of giant flowers. It seems evident that even the Etoile d'Yon form is likely to be eclipsed for dimensions this season, but with much better quality. Mr. Mease's first show effort will be made at Kingston on the 7th, when he will try his best to retain the Challenge Vase, which he now holds, and for which a severe fight is looked for from the three competitors, Messrs. Tate, Bryant, and Collis-Brown. Mr. Mease has in a frame one of the finest lots of double Chinese Primroses, some sixty plants in large 32-pots, and carrying grandest heads of bloom I have seen. He has also a brilliant lot of zonal Pelargoniums in bloom, a big collection of winter and Malmison Carnations, some fine Cliveias, and a big batch of seedlings, three years old, from a first-class stock, from which something good is looked for. *A. D.*

VICTORIA PARK.

One of the first of the London parks to offer to the public an annual display of Chrysanthemums, the show at Victoria is again worthy of praise. The plants are well grown, and many of them carry blooms which, if not exceptional, are quite up to the average both in colour and size. There are something like 2500 plants, including 300 varieties, and they are displayed in the large span-roofed house, which has been used for the same purpose for several years past. In grouping there has been no departure from the usual bank system, but in regard to the arrangement of the colours, much taste has been employed, and it was particularly noticeable that the general quality of the blooms, as well as the artistic disposition of the colours, was much appreciated by the visitors—always demonstrative of their enjoyment, and in language differing very much less in enthusiasm than in the degree of refinement manifested in its expression. In noticing those that were specially attractive a week ago, that fine cerise Japanese Gloire du Rocher is most fresh on the memory. It appeared here as well, if not better than we have seen it anywhere this season. Mrs. F. Jameson also was good, and Val d'Andorre on stiff starchy plants, particularly so. The blooms of William Tricker, one of the finest of the Japanese, were deep, and well-coloured; and Edwin Molyneux was represented by blooms of the first order. Col. W. B. Smith, though of good colour, was not quite up to proper size; but Peter the Great and Edouard Audiguier were very good, as were also Jeanne d'Arc, Gloria Mundi, and Queen of England.

The incurved section was also up to exhibition form, and rather earlier than in some other of the parks. Lord Wolseley, White Beverley, Mr. Bunn, Prince Alfred, and Mrs. George Rundle, were the most prominent. Mons. R. Bahuant was quite at its best—almost past it, but the blooms had been very good. Mr. Gibson and his grower, Mr. Large, have every cause to be satisfied with the result of their efforts. The show is quite at its best, and visitors should proceed to Cambridge Heath station, on the Great Eastern Railway, from which it is only distant a quarter of a mile.

HOME CORRESPONDENCE.

A ROSE-COLOURED CALLA (RICHARDIA "DE WAAL," HORT. KRELAGE).—In his interesting notes on *Richardia Lutwychei*, Mr. N. E. Brown mentions several new *Callas* not yet introduced into cultivation or unknown to practical gardeners. "I know," says Mr. Brown, "one that has the margins of the spathe more or less tinted with rose. This, I have reason to believe, is just introduced into cultivation, but I have not seen an actual specimen of it, unless it should prove to be *R. Lehmanni*, which was sent to the Cambridge Botanic Gardens some years ago as a rosy variety of *R. aethiopica*, although under the English climate no rosy colour was developed—at least, in the only specimen I have seen" (*Gardeners' Chronicle*, 1893, i., p. 568). Last June our firm received from South Africa a *Richardia*, said to be quite new, and producing flowers of a rosy-red colour. This *Richardia*, which a few days ago produced its flower, proves to be quite distinct from all species of *Calla* hitherto introduced. The leaves are not sagittate, with basal lobes as in all other *Callas*, but lanceolate, $11\frac{1}{2}$ to $15\frac{1}{2}$ inches long, and 2 to $2\frac{1}{2}$ inches broad, bright pale green, without spots. The petioles are $7\frac{1}{2}$ to $11\frac{1}{2}$ inches long; the scape measures $15\frac{1}{2}$ inches; the spathe is $4\frac{1}{2}$ inches long, and of a much more elegant shape than in *R. albo-maculata*; the colour of the spathe is white, tinted

FIG. 91.—RICHARDIA LEHMANNI? SPATHE ROSE-COLOURED.

with soft rose on both sides, but especially outside. The bud shows a well-marked rose colour, so that one expects to see a rose flower; when expanded, the colour proves to be changed into white with a pale rosy tint. The spadix, with the male and female parts, are nearly of the same structure as in *R. albo-maculata*. It is quite evident that the plant described above represents an entirely new type of *Calla*. The species in question, which was first brought under our notice by Mr. De Waal, from South Africa, is not so showy, perhaps, as the *R. albo-maculata* and the common *Calla*, but the introduction of this new species proves that there may be shortly expected a revolution in garden *Callas*, as most probably it is not the only species of the type with lanceolate leaves and rosy coloured spathes. *Ernst H. Krelage (E. H. Krelage & Son), Haarlem, October 26, 1893.* [Pending the botanical examination of the flower, we deem it better to call this plant De Waal's *Richardia*, and not to give the Latin termination till the botanical history is cleared up. Ed.]

THE GARDENERS' ORPHAN FUND.—If I am rightly informed, it was reported at the last meeting of the committee that the card collection among the gardeners of the United Kingdom had, up to the present time, realised something under £30, probably hardly covering the cost of issuing the cards. In the face of the large number of gardeners in the kingdom, the result must be most disheartening to the committee on whose shoulders falls the burden of the work, and who have to take upon themselves heavy responsibilities. It is not

creditable to the craft that such a miserable result should flow from several thousands of applications. A very large number of the gardeners of the United Kingdom are married men with families, and any one of them may be stricken down to-morrow, leaving a wife burdened with a family of children. There is not a widowed mother who is to-day in receipt of 5s. weekly for one of her children who does not bless the labours of those by whom she is in receipt of this sum, and yet it does appear that there is a great lack of sympathy on the part of the gardening profession with this most deserving charity. *One of the Founders.*

LIQUIDAMBAR STYRACIFLUA.—The present season has been a capital one for observing this deciduous half-tree in its true character. The rich colouring which the leaves assume in the autumn has been developed this year to the utmost, and when seen at its best this tree shows itself to be one of the finest hardy deciduous subjects we possess. Soil that is heavy in character does not induce an extra free growth; light loam or a sandy soil, even if it be peaty, are generally more the kind of soil to its liking. *E. M.*

BATAVIAN ENDIVE.—Under the name of *Endive Belges*, this can be obtained as a vegetable, cooked like *Seakale*, at the best restaurants in London. It is even finer as a (bitter) vegetable than raw, and it can be preserved. *D.*

LATE PEAS AND ROSES.—On casually looking into the volume of the *Gardeners' Chronicle* for the year 1852, in a notice of a meeting of the Horticultural Society of London, held in the society's rooms, Regent Street, Oct. 16, several things were observed to have been shown, which points to that year being as warm, at least the autumn season, as this year. There were six dishes of Peas shown, five being English, and one foreign. The English consisted of Knight's Marrow, in every respect excellent. Mr. Evershed, market gardener at Godalming, showed an equally excellent Long Jonquil, a first-rate but little-known Pea. Other Peas were Early Warwick and Great Britain, a large-podded variety. Knight's Marrow was furnished by Mr. Culverwell, gardener then as now at Thorpa Perrow, Yorkshire. As showing the mildness of the weather, Mr. Francis, nurseryman, Hertford, showed blooms of the following Roses, Bourbon Queen, Jacques Laite, Mrs. Bosanquet, La Reine, Devoniensis, Géant des Batailles, Bougère, Belle Allemand, Rambuteau, Elise Sauvage, Dr. Marx, Marquis of Ailsa, Safranot, Comte de Paris, Souvenir de la Malmaison, Baron Prevost, Standard of Marengo, Marquis Bocella, Cloth of Gold, and Dupetit Thouars. Good Roses, all of them, but including some that have had to make room for their betters in the forty-one years that have elapsed since 1852. Of the Peas named above, Early Warwick alone remains in seedsmen's list, and that variety will soon be superseded by better ones. *Looking Backwards.*

HEAVY PEARS.—I have just taken the crop of Uvedale's St. Germain Pears from an old horizontally-trained tree on a south-west wall. The weight of six of the largest fruit individually and in the aggregate is worth recording, viz.:—No. 1 fruit, 2 lb. 3½ oz.; No. 2 fruit, 1 lb. 12 oz.; No. 3 fruit, 1 lb. 11½ oz.; No. 4 fruit, 1 lb. 7½ oz.; No. 5 fruit, 1 lb. 3½ oz.; No. 6 fruit, 1 lb. 2½ oz.—Total, 9 lb. 8½ oz. The tree had not borne any fruit for many years, and the present crop is not a large one, but the fruit is very fine and clean. Raspberries were picked here last week (both for tarts and dessert) wonderfully clean and good. Truly an extraordinary season. *J. Lawrie, The Gardens, Maristow.*

AUTUMNAL TINTED TREES.—The autumnal tints this year are strongly marked, and some charming shades of colour, and contrasts as well, are to be met with now in so many of our ornamental trees. I am particularly struck with the rich beauty of the foliage just now of a fine specimen of the deciduous Cypress (*Taxodium distichum*) on a lawn, with its rich brown-coloured foliage, a conspicuous object amongst other foliage in decay. *Liquidambar styraciflua* is very ornamental at this season, with its crimson foliage. There is great beauty in some of the Thorns at this time of the year, when the trees are loaded with fruits, and the foliage is dying, and Oaks, Elms, Limes, and Ash have striking tints, as have *Rhus cotinus*, *R. xtyphina*, *Spiraea arifolia*, *Zizyphus paliurus* (the Christ's Thorn), and the bright-wooded *Cornus* (*Dog-woods*). *H. D.*

GOLDEN QUEEN AND MRS. PEARSON GRAPES.—Owing to the long period of heat and sunshine which prevailed this year, fruit has been of an unusually high colour, and especially white Grapes; the berries of Golden Queen and Muscat of Alexandria acquiring an amber colour before the month of August expired, Mrs. Pearson taking on the same colour a little later. Golden Queen, when well-grown, is a beautiful Grape, and of fairly good quality. The finest bunches that I have seen of it were staged at the Edinburgh Show in September, 1885, by Mr. David Murray, gardener at Culzean Castle, Maybole, Ayrshire; and Mr. J. Hammond, gardener to Sir Wilfred Lawson, at Brayton, near Carlisle. The bunches shown by Mr. Murray, were long and solid. The oval-shaped berries of fine size and finely coloured. The Brayton specimens were not quite so large in bunch, but in every other respect they were the equals of the Culzean Grapes. The same autumn Mr. Murray kindly sent me a shoot of Golden Queen Grape, which I grafted on a young Vine of Muscat of Alexandria at the east-end of the Muscat-house, thereby effecting an improvement in the flavour of Golden Queen—an improvement which, in my opinion, is sure to follow in the produce of all Vines (not Muscats) worked on the Muscat of Alexandria. Golden Queen is a strong grower, a good bearer, and a free setter, doing well under the treatment bestowed upon Muscats, and requiring the berries to be thinned-out well. Sometimes the golden transparency which characterise all well-ripened bunches of this Grape become slightly clouded a week or two after the berries have acquired the much-desired colour, thereby detracting somewhat from the appearance of the bunches. This clouding of the berries, however, may be averted for a few weeks, if not altogether, by a warmish, well-ventilated air in theinery. Good examples of Golden Queen find a ready sale in the shops, being asked for by customers in preference to Buckland's Sweetwater and Foster's Seedling. Mrs. Pearson, like Golden Queen, was raised by Mr. Pearson from Black Alicante, crossed with Ferdinand de Lesseps, and he obtained First-class Certificates for both varieties—Mrs. Pearson in 1873, and Golden Queen the following year. It is certainly the best flavoured late white Grape with which I am acquainted, partaking strongly of the flavour of Muscat of Alexandria. It is a free-growing variety, the bunch is well-shouldered and tapering, from 12 to 14 inches long, and from 6 to 8 inches in width at the shoulders. The berries are of a yellow colour, and measure nearly 3 inches in circumference; the skin being somewhat thick, the berries keep in good condition for a longer time than other white or amber-coloured Grapes. In point of flavour it is but slightly inferior to that of the Muscat of Alexandria. I intend to grow more of these two varieties by engrafting them on established Vines. *H. W. Ward, Longford Castle.*

A RECIPE FOR A WINTER DRESSING.—Vines and Peaches, Plums and Cherry trees, may be dressed with the following:—1 lb. of sulphur, 1 lb. of tobacco-powder, 1 lb. of soot, 2 lb. of clay or stiff loam, 1 lb. of paraffin-soap, and 3 oz. of nux-vomica powder, put into a pail, and well mixed together, then put boiling water with these sufficient to make it about the thickness of ordinary paint, covering it over for twenty-four hours. It can be used on the stems and shoots of Vines and fruit-trees against insects of all kinds, and as a preventive of mildew. *W. Smythe.*

NURSERY NOTES.

THE "OLD" NURSERIES, MAIDSTONE.

AFTER travelling some 400 miles to attend the Great Fruit Show in the Agricultural Hall at Islington on August 29, for which ample reward was had in viewing the magnificent and instructive display set before the public on that occasion by the Royal Horticultural Society, resolved to find a day before returning home to carry out a long-cherished wish to visit the Fruit Tree Nurseries of Messrs. George Bunyard & Co. at Maidstone. I wished to learn all I could about the treatment the trees received to produce such grand specimens of large, handsome, high-coloured, and perfectly-finished Apples and Pears.

Passing through the wide villa zone which skirts the metropolis on this side, the country assumes a more charming aspect, and in many of the pleasant

retreats that so thickly stud the Beckenham district of Kent, and for miles onwards, the inhabitants may quietly dream they are a thousand miles away from the busy stir of city life. The rural aspect of the country increases as Bickley and St. Mary Cray stations are passed without stopping; and on the way to Sevenoaks we can leisurely note the condition of the farm and garden crops, and observe with regret their parched and miserable condition, from the long and severe drought of the past summer. The meadows seemed as hare and brown as a turnpike road, and grain and root crops were of the most wretched description, the Potato fields being the only fair exception, but they were too few to go far to redeem the great loss the farmers must suffer by the failure of their other field crops. It was, however, a pleasing feature to notice how well the fruit trees in gardens and orchards were thriving and bearing splendid crops, in the midst of all the disasters to other crops around them, arising no doubt from the depth of their roots in the soil, which renders them much less liable to suffer from want of rain and a parching atmosphere. Leaving Sevenoaks, we soon begin to observe that the orchards in "the Garden of England" are receiving more care and attention from their owners than what was apparently customary in bygone times. Old orchards are being cleared of small and worthless varieties of fruit, and the best and most productive of new kinds are being planted to replace them. A considerable extent of fresh land has been recently planted with thrifty young fruit trees in the famed Hop country around Malling, and it was interesting to notice how well both orchards and Hop-gardens were thriving in the hands of skilful and competent men, and producing crops of the finest quality in the greatest abundance; while on the other side of the hedge, where *laissez faire* was apparently the watchword, the dilapidated and exhausted condition of the orchards, starved Hop-gardens, and all-round wretchedness, bespoke a want of intelligent enterprise to march with the times, which is certain to end in great loss and poverty to those concerned. As we approach Maidstone, orchards and fruit gardens, both renovated and new, seem to increase and flourish more and more, till we arrive in the rich valley of the Medway, which at the present day may be deemed the English fruit grower's paradise, since from one part or another of it, and especially from near Maidstone, have come the grandest samples of hardy fruits which have adorned the exhibition tables throughout the country for the last decade.

Here, then, in the very centre of this rich fruit country, Mr. George Bunyard, the sole partner in the business, has, by untiring enterprise and skill, raised up the immense fruit tree establishment which has made the name of "Bunyard of Maidstone" a household word. A careful student of Nature, and a most skilful pomologist, Mr. Bunyard takes the keenest interest in the cultivation and correct nomenclature of his stock of fruit trees, growing at Allington on over 100 acres of ground. This nursery lies about 2 miles north-west of Maidstone, and adjacent to Barming station on the L. C. & D. Railway, where visitors to the fruit tree nursery should alight, to save the long walk or drive from Maidstone. The fruit trees being the object of my visit, no time was lost in driving out to Allington, where I was accompanied by Mr. Bunyard over the whole of the vast collection of fruit trees. The site of the nursery is open and exposed, lying high above the valley of the Medway, and the north-easterly gales from the German Ocean are often severely felt in winter and early spring, so that the hardiness of everything grown here is thoroughly tested, and may be depended upon in any moderate climate. The soil is of a light loamy nature, freely mixed with gravel, and by no means appears to be specially adapted to successful fruit growing; but being of considerable depth, and highly amenable to good cultivation, the result of skilful management is really astonishing to those accustomed to deal with soils of a different staple and more body. Mr. Bunyard has a firm and well-founded belief in a

thorough cultivation of the soil, and due attention to every detail which tends to insure a healthy and vigorous growth, in all of which he is ably seconded by his foreman, Mr. Bush.

Starting for a tour of the fruit-tree quarters, I was immediately struck by the health and vigour of the stock, on which it is difficult to find any signs of disease or insect attack. Neither are weeds or filth of any kind allowed to encumber the ground, to the detriment of the crops, but everything is as clean, and in as well-kept order as in the best private garden in the country. The trees have all sufficient space allowed them in the rows to make vigorous growth, while between the rows the width is three feet or more, to allow air to pass freely, and for the convenience of getting at every plant to attend to its wants at the proper time. The wide space between the rows is deeply stirred and kept clean by pony or horse power, which economizes labour, and keeps the soil in the most perfect state of tilth, so much so, that in walking along between the rows the foot sinks deeply in the pulverized soil, and on repeated trials in various places, we easily drove our boot clean out of sight in the friable, mellow soil, in which everything appears to grow luxuriantly. To this thorough tillage and free circulation of air, more than to stimulating manures, Mr. Bunyard ascribes the remarkably sturdy vigour of his stock.

Large quarters of maiden and trained Peaches and Nectarines were seen, comprising hundreds of fine-trained trees of all the popular varieties, as well as quantities of new or less-known varieties, all growing in the most perfect condition. Apricots were equally healthy-looking, clean-grown, and well-trained; in prime condition for planters when the season came round. Plums and Cherries are grown in immense numbers, on all manner of stocks suitable for different soils and purposes, and all in vigorous health and perfectly clean.

Among Plums, the ever-popular Victoria is grown in greatest numbers, but Jefferson, Coe's Golden Drop, Pond's Early Prolific, Kirke's, and many other of the older kinds, are also extensively grown, as well as several varieties of Damsons, especially the Farleigh variety, which originated in the district. Nor are the newer Plums omitted, as every variety worth cultivating in Britain is more or less numerously represented, according to its merits and the demand for it. Large numbers are specially grown for orchard standards on 6-foot stems, among which the Kentish Diamond is a local favourite, from its vigorous habit and free-bearing qualities in the county of Kent. Cherries are a specialty in Kentish orchards, and the demands of growers are amply provided for in the large extent of stock of all suitable kinds, which are so well grown here. The fruit on both Plums and Cherries was nearly over at the time of my visit, but what was left showed the prolific nature of the young trees, and the high quality of the fruit. It is astonishing how fruitful the young trees are in this nursery, and the revenue from the fruit alone must be a considerable item in the annual returns from a large proportion of the ground occupied by the two and three-year old fruit trees, which form probably two-thirds of the whole stock, youth, vigour, and fertility being its chief characteristics.

It is, however, among the Pears and Apples, occupying scores of acres of land, that the precocious fruitfulness of the stock was most evident at the date of my visit. Quarter after quarter, with thousands of trees in vigorous health growing upon them, was passed in review, in which the splendid crop of the finest fruit was the most conspicuous feature. Among Pears, Pitmaston Duchess, Williams' Bon Chrétien (nearly past), Dr. Jules Guyot (larger and finer than Williams' Bon Chrétien, to which it bears considerable resemblance), Souvenir du Congrès, Doyenné du Comice, Beurré Clairgean, Beurré Hardy, Beurré Diel, Beurré Bosc, Durondeau, Conference, Marie Louise, Louise Bonne of Jersey, and numerous other well-known varieties, were hanging on cordons, bushes, and pyramids, like strings of the largest Tripoli Onions, the size, colour

and quality being of the best. Among the newer Pears bearing fruit, Mr. Bunyard specially mentioned Dr. Jules Guyot, Marguerite Marrillat, Fondante de Thirriott, and Beurré Mortillet, as superior varieties that are likely to prove valuable additions to the choicest collections.

In the Apple quarters, which may truly be said to form the chief feature in the nursery, as they are spread over the entire length and breadth of it, the vigour and fertility of the young trees reached its climax. Whatever the cause, high culture, climate, soil, site, manure, or favourable season, or all combined, the quantity, size, and quality of the produce was a marvel of success. Numerous quarters of the choicest varieties, Cox's Orange Pippin, Ribston Pippin, Worcester Pearmain, King of the Pippins, The Queen, Lane's Prince Albert, Blenheim Pippin, Ecklinville, Gascoyne's Scarlet, Duchess of Oldenburg, Golden Spire, Cox's Pomona, Cardinal, Lady Sudeley (about over, but brilliantly coloured), Potts' Seedling, Wellington, Lord Suffield, Lord Grosvenor (more vigorous than the preceding and equally prolific), Bismarck, Cellini, Royal Jubilee (a handsome and promising variety), Warner's King, Winter Hawthornden, Stirling Castle, Frogmore Prolific, Baumann's Red Reinette, Queen Caroline, Mère de Ménage, Beauty of Kent, and a host of other excellent varieties too numerous to note, were heavily laden with splendid fruit, on trees of all shapes and sizes, from two to four years old, and many of the older bush trees were literally borne to the ground with the load they carried, although they had all been thinned to allow the fruit to attain its full size. Nor did the trees seem in the least distressed by the loads they were carrying, as they were all in robust health, and had made a free vigorous growth, well ripened, and thickly set with fruit-buds, giving promise of as great an abundance next season.

Mr. Bunyard mentioned that next to Worcester Pearmain, which at present is the Apple greatest in demand by planters, Golden Spire was being most asked for, it having proved a remarkable free-bearer everywhere, and a favourite market Apple.

A considerable space has been set aside in the highest part of the nursery, on which Mr. Bunyard is forming a permanent collection of all the best varieties of Apples, worked on all the different kinds of stocks, to be grown as bush trees, to fully test their durability and continued fertility. The collection was only begun to be formed about two years ago, but the success which it has already achieved, promises to add greater interest to it year by year as the trees develop their merits and peculiarities, and arrive at a state of full maturity. All the varieties already mentioned, and many others, are here seen on their trial, and the merits and demerits can be readily compared and noted by those anxious to acquire information. Such prolific varieties as Cox's Orange Pippin, here one of the most fertile and unrivalled in quality among dessert Apples; King of the Pippins, Worcester Pearmain, Lane's Prince Albert, Stirling Castle, Yellow Ingestrie, Golden Spire, Lord Suffield, Cellini, Red Reinette, Frogmore Prolific, Grenadier, and other free-bearing kinds, are already paying well for the ground they occupy, and they form a most interesting "object lesson" to the aspirant in hardy fruit culture. It is evident to the most ordinary capacity that well-directed skill, based on sound knowledge, has had much more to do with the excellence of the fruit grown and exhibited by Mr. Bunyard at the fruit shows in the country in recent years, than any natural surroundings or advantages of soil or climate, although these are undoubted factors in the successful cultivation of hardy fruit.

With such a soil and climate as prevail in the valley of the Medway, orchard-houses are at a discount, and Mr. Bunyard's finest fruits are the produce of skilful cultivation in the open air.

The few glass-houses in the Allington Nursery are devoted to the growth of new and rare kinds of fruit of a tender nature; and to a well-grown collection of the best Figs, Peaches, and Nectarines, part grown in pots, and the remainder planted out.

I cast a hurried glance over the wide breadths of

vigorous and clean stocks for the various kinds of fruit trees, and the lately-budded quarters, all done by "piece-work," in the neatest and most business-like manner, to the extent of how many "hundreds of thousands" few people can have any idea of, and scanned acre after acre of one-year-old trees, all growing at the regulation distance of 3 feet between the rows, clean and vigorous in growth, and of such a robust and well-furnished character, and so straight in the lines as to present the appearance on looking along the rows of so many neatly-kept hedges, from 4 to 5 feet in height. The skill and pomological knowledge of Mr. Bunyard were evident at every step, and I was not surprised when told that he personally inspects every fruit tree in every row in this extensive nursery twice a year at least, to detect "rogues," if any, and to make sure that every variety is in its best form, and true to name. The first inspection is made in the early summer, when the growth and foliage are fresh, and fully developed, and exhibit the natural characteristics by which so many of them are easily distinguished by the well-trained eye; and the second in the autumn, when the fruit has about reached its full-size and maturity, when every variety is carefully examined, and its merits or demerits as carefully noted for future use. *M.*

ECKFORD'S NEW PEAS.

I had heard so much about the great breadth of ground for Peas at Wem as to be somewhat sceptical as to the truth of the statement, but I took a journey to Wem some little time since, and found 5 acres devoted to the sweet and culinary Peas already sent out and to be sent out.

Of the culinary Peas, a variety named Wem will make a reputation, for it is in every way a very fine Pea, of moderate height, with a long well-filled pod, and a plentiful cropper. Critic is another first-class Pea, 5 feet in height, early, and most prolific. Aston Gem is a Pea of the very first quality, about 3 feet high, and a great cropper—a Pea that will make its way. Rex and Armorial are two other high-class Peas, and so also is Chieftain. Mr. Eckford has made Ne Plus Ultra and its progeny the pollen-bearing parents, with a view to secure square-ended pods of large size, and of Ne Plus Ultra quality, and so far as can be judged of a batch of seedlings under trial, and to go through further ones, very early Peas of Ne Plus Ultra quality were being secured. Thin sowing is adopted here, and in the Wem Peas a branching habit has been aimed at, together with obtaining pods in pairs instead of singly, and it was surprising to see the large numbers of full-sized pods on a single plant. Of varieties already sent out I specially noticed as first-class, Epicure, Censor, Superabundant, and Consummate.

It was on a hot day that I had a run through the Peas, and the great variety seen there was somewhat bewildering, for the character of each variety was well shown in the long rows and masses of colour, and with these, as with culinary Peas, thin sowing, or rather planting, is the rule. Foremost amongst new kinds to be introduced are Duchess of York, white, striped with pink; Duke of York, bright rosy-pink, the entire flower being suffused with a primrose tint; Meteor, bright orange, tinted pink, with a purple flush suffused over the flower; Eliza Eckford, blush, with a rosy-purple stripe, and pink margin; and The Belle, a very pretty variety. These are all acquisitions, the flowers of good size and improved form; and in these, and the newer varieties sent out lately, the flowers are more numerous on the stalks than on the old kinds. Of the more recently-introduced kinds, the following struck me as exceptionally good, viz., Stanley, Lady Penzance, Blushing Beauty, Peach Blossom, Venus, Emily Eckford, Ovid, Royal Robe, and Firefly; and of still older and better-known varieties, the following were very fine, viz., Mrs. Sankey, Apple Blossom, Orange Prince, Mrs. Eckford, Lemon Queen, Senator, Dorothy Tennant, Mr. Gladstone, Monarch, Cardinal, The Queen, and Imperial Blue. *Commercial.*

ORCHIDS AT MESSRS. JAS. VEITCH & SONS.

Clean, healthy, and well-rooted specimens of all the best Orchids are always to be found at the Royal Exotic Nursery, King's Road, Chelsea, and with the never-failing show of flowers in the Orchid-houses, some rare species or hybrids are always to be met with. The very warm and long summer was of great benefit to the Orchids, and strangely enough Odontoglossums, and more especially to *O. trinymphans* and *O. crispum*, which Mr. Canham—who has had the cultivation of the Orchids under his care—says that during the twenty-three years he has had charge of them the plants have not made such progress in any like period as during the last six months.

In the Cattleya-house all the larger-growing species of Cattleyas and *Lælia* promise well for bloom; and at the present time a beautiful display is made by numerous selected fine varieties of *Cattleya labiata*, some of the dark forms of which have rich purplish labellums, the colour extending over the side-lobes; the light-coloured varieties are likewise very pretty. *Cattleya Bowringiana* does well here, and the forms now in bloom vary in hue from lilac to purplish-crimson. The possibilities of its usefulness to the cross-breeder were shown in the beautiful *Cattleya* × *chloris* raised and flowered by Messrs. Veitch, and illustrated in the *Gardeners' Chronicle*, October 28. The beautiful new *Lælio-Cattleya* × *Pisandra* (*Lælia crispa* × *C. Eldorado*), *L. c.* × *Cassiope* (*L. præstans* × *L. c.* × *exoniensis*), and the beautiful *Cattleya* × *Harrisii* (*Leopoldi* × *Mendeli*), are also in bloom, the last-named proving to be one of the finest of garden hybrids yet raised; its delicately pink-veined sepals and petals and large carmine-crimson labellum, constituting a noble flower.

Other noteworthy plants in the large Cattleya-house were *Lælia Dormaniana* with many flowers, *Lælia* × *elegans*, *L. autumnalis*, and *Lycaste Skinneri alba*. A fine lot of the white varieties of *Lælia anceps* will soon come into bloom. The Orchid rockery-house is bright as ever, the rock, clad as it is with *Ficus minima*, and planted with Ferns, being not only effective but having a beneficial effect on Orchids. At the present time there are many spikes of graceful forms of *Oncidium Forbesii*, *O. pratextum*, *O. varicosum*, *O. pulvinatum*, *O. cheiroporum*, *O. aurosom*, *O. tigrinum*, and other *Oncidiums*; indeed the show may be said to be of *Oncidiums*, though there are in bloom plants of *Lycaste Skinneri*, a *Cologyne barbata* with fifteen spikes, *Odontoglossum Lindenii*, *Cymbidium* (*Cyperorchis*) *elegans*, *C. Mastersii*, &c., arranged with them. Passing through the houses where are the *Vandas* and *Acrides*, the excellent condition of which is remarked, we come to a house in which a very handsome display of flowers is noted, chiefly of *Dendrobium Phalaenopsis Statterianum* and *D. P. Schroderianum*; and scattered amongst them were flowering plants of *D. Dearei*, *D. album* (aqueum), *D. bigibbum*, some very fine *D. superbiens*, *D. undulatum*, some grand ones of *D. formosum giganteum*, *Miltonia Roelzii*, *M. R. alba*, *M. Bluntii* var. *Lubbersiana*, and the most beautiful form of *Phalaenopsis Esmeralda* we have ever seen. The lower halves of the sepals are bright yellow, the rest of the segments lilac; the lip is purplish-crimson at the tip, the base white, and the side-lobes reddish-brown, altogether a novel and striking contrast of colours, and far removing this particular specimen from the imputation of insignificance under which most of this species suffer.

Among the *Cypripediums* in bloom we found *C. × T. B. Haywood*, always a fine flower; *C. × Ianthe*, a noble hybrid of *C. villosum*; *C. × Arthurianum pulchellum*, a far more beautiful flower than the old form; *C. × cœnanthum superbum*, still a favourite; *C. × Charles Canham* and *C. × Mrs. Canham*, two of the most stately of hybrid *Cypripediums*; the pretty white *C. × Cleola*; and the still more charming wax-like *C. × Clonius* (*conchiferum* × ♀, *caudatum Wallisii* ♂), which obtained a First-class Certificate at the last meeting of the Royal Horticultural Society. With these were the usual forms of *C. insigne*, *C. × Swainianum*, *C. ×*

cardinale, and a number of others of the C. × Sedeni type; C. × Ashburtonia majus, C. × macrochilum, C. Godefroyæ, and a fine batch of C. Spicerianum, one of the varieties being a very fine and distinct form.

Among good examples of other things in flower were *Maxillaria grandiflora*, *Trichosma suavis*, with many spikes of its fragrant white and purple flowers; *Masdevallia bella*, *Aërides Lawreuceanum*, *Cœlogyne Massangeana*, *Oncidium ornithorhynchum*, and many plants of botanical interest.

FLORISTS' FLOWERS.

CHRYSANTHEMUM SPORTS.

WHETHER we shall ever know the reason why the *Chrysanthemum* sports, and be able to control them, is not the question which I purpose taking up in this paper. Much has been written on the subject, but I cannot see that we are very much nearer a solution than was the case twenty years ago. My object is to place in a concise manner the names of the principal varieties and their origin, so that readers of the *Gardeners' Chronicle* may see at a glance whence those varieties came.

From conversation with several enthusiastic cultivators of the *Chrysanthemum*, it is easy to learn, that in spite of all that has been written on the subject of the introduction of varieties, there still exists a considerable amount of ignorance of the facts and history of certain varieties. The only distinction which I know to be found in sports of one group of *Chrysanthemums* (with two exceptions) is in the colour of the flowers. The same habit of growth, and, I might also say, a similarity of bloom as those of the parent, exists in all sports. It is most difficult indeed to distinguish one variety from another by the stems or the leaves, when both belong to one group—in fact, I think it is impossible so to do; not, however, is it difficult to distinguish one group from another group, this being a very easy matter to anyone with only a slight knowledge of the *Chrysanthemum* under cultivation. The two exceptions, and they are notable ones, where there exists a difference in the formation of the flower from that of the parent, is in the case of Mrs. Horril from George Glenny, obtained some years ago. The latter variety is, as nearly everyone knows, a primrose sport from Mrs. G. Rundie. Mrs. Horril is a distinct reflexed flower sprung from an incurved flower. It is also remarkable that the colour is the same in both parent and sport. These are combinations of freaks certainly. Mrs. Horril is one of the best varieties in existence as a decorative *Chrysanthemum*. The other remarkable instance where the sort is unlike, is that of John Bradner, an incurved, which is the result of a sport from the reflexed variety. Mrs. Forsythe, which originated perhaps a dozen years ago, and has since been lost sight of; it was a variety never much in request, not being in any way a perfect flower. I mention these two instances to show the large range of variability that may exist in *Chrysanthemum* sports. The freak appears to be more prevalent in the incurved section than in any other, and perhaps it is fortunate that it is so, as this section receives so few additions by any other means. With the exception of the original varieties in each family, all the best flowers have originated as sports in the incurved section. Many varieties have been raised from seed, but with few exceptions, and these are recent; the seedlings are not equal to the sports—at least, not according to the English standard. It likewise seems strange that the oldest of the present cultivated varieties (*Nonpareil*) does not give us a sport, although this was introduced fifty-five years since.

Up to the present time I am not aware of any variety that has been raised from this one. Some varieties that we know of originated as seedlings, are now affording others by means of sporting. For instance, *Jeanne d'Arc*, which was sent out in 1881 by Lacroix, has sported once, giving us *Brookfield Gem*, a deep lilac flower, contrasting well with the

purple-tipped blush-white of the parent. Some families have increased in numbers rapidly, too much so in some cases; there being apparent a desire to increase them too fast by sending out varieties which are not sufficiently distinct to warrant their being given a separate name. Some persons may think that there is no harm in giving a variety a name, because it has some imaginary difference, but there is a good deal of harm done by the confusion it causes, and sometimes something more serious; and no flower which is not thoroughly distinct is worthy of a name.

The desire for novelty is so strong that any supposed variety is eagerly brought out, and often before it has been proved to possess distinctness. Although the Japanese varieties greatly outnumber those of the incurved flowers, they are mainly seedlings; there are fewer Japanese sports which possess that degree of perfection demanded at the present day, and insisted on in the case of the incurved. Among the latter, *Queen of England* is not only more productive of sports than any other, but it is also the most popular group. This variety was introduced by J. Salter, as far back as 1847, and nine years later it gave the sport *Alfred Salter*; and thirty-two years elapsed before this scion of *The Queen* sported in Mr. R. Mudie. By some growers this variety is considered to be superior to *John Doughty*, with which it is classed as being identical, but it does seem strange that the one should be from *Alfred Salter*, a sport of a sport, and the other from *The Queen* direct. This is but another instance of the peculiar manner in which these sports occur, and one was obtained in Scotland and the other in Kent, the former the first in point of seniority, but as it was not made widely known, it was lost for a year. *Golden Queen of England* was the next sport obtained from *The Queen*; this was in 1859. This variety has perhaps been the subject of many mistakes as to its origin. However, the type is still highly valued as furnishing a desirable colour.

During 1861, *Empress of India* was sent out; this pure white sport also came from *Queen of England*, and is highly prized as an exhibition variety. Sixteen years later saw the advent of a clear golden-yellow sport, *Golden Empress*, from the white *Queen of England*. Five years afterwards came the best of all, *Lord Alcester*, a grand variety, which originated from a plant belonging to a policeman in Somersetshire, where it had existed for two or three years before coming into commerce. As recently as 1891, Mr. Robinson King, a sport from *Golden Empress*, was brought into prominence. Another sport is in existence from the original, which has faint pink stripes in the pure white petals, but I fear it is not distinct enough for exhibition purposes.

The next in importance is the *Princess of Wales* group; notwithstanding the fact that the original was not introduced until 1864, no less than four sterling varieties have come from it in that time, viz., Mrs. Heales in 1867, the next year Miss M. A. Haggas—from Mrs. Heales, and *Violet Tomlin*—coming from the type variety. Several others have sported, but as they are not looked upon very favourably, I will not name them here, as it might introduce confusion, which is most undesirable. The group known as *Princess Teck* is worthily represented by six varieties: the original sent over by Pethers in 1868; then six years later we got *Hero of Stoke Newington*, Mrs. Norman Davis following in 1886, and *Lord Eversley* one year later; in the year 1886 *Lady Dorothy* and *Charles Gibson* came out, the latter a sport from Mrs. Norman Davis, and the white-flowered *Lady Dorothy* emanated from the *Hero of Stoke Newington*, *Lord Eversley* being a pure white counterpart of its parent, *Princess Teck*. *Jardin des Plantes* is still unrivalled in colour; it was brought out as long ago as 1859, and *Novelty*, a bronze form of it, came out eleven years afterwards, and in 1888 it sported, giving us *Alfred Lyne*. *Barbara*, one of the 1869 introductions, has recently provided us with an almost pure yellow form. *Beverley*, introduced by Smith in 1863, gave a golden form three years later, and

again sported to a bronze form, *H. Shoemith*. *Lady Slade*, one of the neatest, but now almost obsolete, came out in 1864, and no doubt was highly prized; twenty-three years later *Angelic* came as a sport from it. *Prince Alfred* was one of *Davis's* flowers of 1863, and, strange to say, it sported in two parts of the country almost twenty years later, since which time seedlings have been raised from the sports, the only English-raised seedling obtained direct that I am acquainted with. In 1861 *Lady Hardinge* came forward, and sporting in 1878, brought out Mrs. W. Shipman. *Princess Beatrice* was first seen as far back as 1868, which last year sported a bronze-coloured bloom, *G. Cockburn*. Pethers brought out *Empress Eugénie* in 1865, which in 1889 sported while being grown in New Zealand, resulting in the introduction next year of Mrs. Mitchell.

Much might be said regarding the Japanese families, but sported varieties of these do not seem so long-lived as the incurveds, and as they are so readily obtained from seed, sports are not nearly so valuable as the latter. Very few of the present-day Japanese grown for exhibition are known to be the result of sporting, which is a proof that they are not numerous. Last year I saw a somewhat strange freak in blooms of C. H. Simmons, a sport from *La Triomphante*, which were distinctly striped two or three times, the whole length of the florets, with primrose, on the rosy lilac of the parent, was a novel combination.

Sporting is not confined to any one section. The reflexed have been added to in the same way; and so have the *Anemone* varieties, not forgetting *Pompon*, and *Pompon Anemone* kinds. All have displayed the same freak, but in a lesser degree than the incurved section, and, fortunately so, or it would have been extremely difficult to have found a place for all. *E. Molyneux*.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

OCTOBER 24.—Present: Dr. Russell, F.R.S., in the chair; Mr. Blandford, Rev. W. Wilks, Professor Farmer, and Rev. G. Henslow, Hon. Sec.

Galls on Oak.—With reference to the galls exhibited at the last meeting, and recognised as those of *Cynips calycis*, Mr. Blandford observed that they are used for procuring tannic acid on the continent, as well as the more common form, on *Quercus infectoria*, which contain 50 per cent.

Dafodils and Mice.—Rev. W. Wilks exhibited several bulbs which had been attacked by *Merodon*; but subsequently the mice had eaten into the bulbs, apparently in order to extract the grub, as no perfect bulb was ever touched. Mr. Wilks intends, and suggests as a means of selection, to spread out bulbs supposed to be affected where mice can have access to them, as the sound bulbs will be left untouched.

Dafodil Decaying.—He also showed a bulb which had decayed up the middle, while the base of the stem was detached together with the roots. It was referred to Kew for examination.

Onions Diseased.—Some large flattish Onions were exhibited, which had become completely rotten in the middle at the base of the stem. Two-thirds of a crop were said to have been lost. They were also referred to Kew.

Injured Timber, Photograph.—Prof. Farmer showed photographs of sections of an ancient Elm, lately cut down at Oxford. They showed a separation, for three parts of a circle, deeply seated within the stem. As the subsequent annual rings were at first discontinuous over the middle point, but gradually closed over it, the interpretation seemed to be that the tree had been partially decorticated, the wound being subsequently completely concealed.

Proliferous Fern.—Mr. Veitch forwarded a plant of *Adiantum* (which appeared among *A. capillus-veueris*, but had broader pinnules), having minute fronds starting from the situation of the sori, apparently being aposporous, and developing new fronds in the place of sporangia. Mr. Veitch remarks that this is the first time that he has seen this occurrence on an *Adiantum*.

Diseased Pears.—With reference to the Pears sent to the last meeting, Mr. Massee reports that "the fungus is *Gleosporium fructigenum*, Berk. There is no possibility of arresting the disease in the mature state of the fruit, but this can be done by using the proper remedy during the development of the fruit." The remedy suggested for the same fungus in Peaches was "two or three sprayings of potassic sulphide ($\frac{1}{2}$ ounce to a gallon of water)."

HAVANT CHRYSANTHEMUM.

OCTOBER 27, 28.—The tenth autumn exhibition of the above society was held in the Town Hall on Friday and Saturday last. Cut blooms of Chrysanthemums receive from the local growers the most encouragement, and a fine display was the result. The principal class was one for thirty-six blooms, half of which were to be incurved and half Japanese varieties. The 1st prize fell to Mr. Penfold, Sir F. FitzWygram's gardener, Leigh Park, Havant, who was just able to squeeze in; his blooms were, of course, good ones, the Japanese large, bright, and fresh-looking, and containing several novelties, but the incurveds were rather small. Mr. Agate, Havant, was 2nd.

In the class for eighteen, in nine varieties of Japanese and incurveds, Mr. Steptoe, gr. to G. Gale, Esq., Horndean, was 1st, with an even lot of blooms; Mr. J. Suter, gr. to J. Lascelles, Esq., Havant, was 2nd.

Incurved blooms in twelve varieties were best shown by Mr. Penfold; Mr. Agate 2nd. These two exhibitors maintained the same order in the competition for the best twelve Japanese, both staging blooms that were well-developed and leading varieties.

Anemone-flowered kinds were capitally exhibited by those veteran growers, Messrs. Penfold and Agate, as were reflexed varieties by Messrs. Penfold and Steptoe.

Pompon and single-flowered kinds are generally seen in good form at the Havant show, and Mr. Agate won with the former; and Mr. H. Brown, gr. to J. Taplin, Esq., with the latter, his collection being excellent.

Mr. Penfold showed both the premier incurved blooms, one of Madame Darrier and the Japanese variety, Colonel B. Smith.

Ladies had a class to themselves, for table decorations with Chrysanthemums, &c., and a very interesting feature it proved, the prizes for the best tables being awarded to Miss Newman and Mrs. A. Stubbs.

Several groups of Chrysanthemums were effectively arranged by Mr. Agate and Mr. Suter.

Table plants and Primulas were well shown, and the fruit was of good quality, if small in quantity, Mr. Penfold showing the best black and white Grapes; and Mr. Maniver, gr. to Lieut.-Col. Thistlethwayte, Drayton, Apples and Pears.

PORTSMOUTH CHRYSANTHEMUM.

OCTOBER 31, AND NOVEMBER 1, 2.—This was another fine exhibition to be added to those already held by the Portsmouth Chrysanthemum Society. The event took place in the Drill Hall, a commodious and suitable building. If the entries were rather fewer in number than usual, the quality of the flowers and plants was excellent for the season, which has not been everything that a grower could wish.

Cut blooms were the most part of the show, and the principal class was that for forty-eight, divided between the incurved and the Japanese varieties. Seven competed, Messrs. W. & G. Drover, The Nurseries, Fareham, taking the 1st place. It may be said of the flowers that the Japanese were fresh and good, but the incurveds were scarcely up to the mark; 2nd, Mr. N. Molyneux, gr. to J. C. Garnier, Esq., Rooksbury Park, Fareham, with good blooms.

For twenty-four distinct, to be equally divided between Japanese and incurved kinds, Mr. Inglefield, gr. to Sir J. Kelk, Bart., Tedworth, Marlborough, was an excellent 1st, having fine blooms of both kinds; Mr. H. J. Parrott, gr. to Mrs. Kiunaird Smith, Wood End, Chichester, being the winner of the 2nd place. There were six competitors in the class for twelve Japanese, distinct, and the blooms were in each stand of good quality; Mr. C. H. Holloway, gr. to F. W. C. Read, Esq., The Wakes, Selborne, was 1st with blooms that were fine, an easy victory; 2nd, Mr. Parrott.

Mr. Penfold, gr. to Sir F. FitzWygram, easily won the highest prize for twelve incurved, and for

twelve reflexed blooms; and Mr. Steptoe, gr. to G. Gale, Esq., Horndean, the 2nd one.

The competition in the Anemone class was well contested, and excellent stands were staged; 1st, Mr. Agate, Havant; 2nd, Mr. Hatch, gr. at Victoria Park.

Pompons made a good display. For twelve bunches, Mr. H. Lee, Moreland's Road, Gosport, was 1st, and Mr. Hatch 2nd, the last-named staging one of the most interesting stands of blooms in the show in the class for fringed flowers.

Single-flowered varieties are always well shown here, and for the best twelve bunches of three blooms each, with foliage attached, Mr. H. Brown, gr. to J. Taplin, Esq., Havant, was placed 1st.

For six blooms of any one Japanese variety, there were several competitors, and Mr. Holloway exhibited well-developed blooms of *E. Molyneux*, winning the 1st prize; and Mr. J. Hughes, gr. to W. Baring, Esq., Norman Court, Salisbury, was 2nd, with *Avalanche*.

Mrs. Singlefield, in incurveds, showed *Jeanne d'Arc*, and took the 1st place with it, and very excellent they were.

Messrs. Perkins & Son, Coventry, won first prize for a bouquet of Chrysanthemums. Mrs. Conway, Havant, was successful in the classes for the best decorated epaigne, with Chrysanthemums, and with autumn foliage and berries, as well as for the best arranged table. In all classes considerable merit was displayed. Plants were successfully staged. The best group of Chrysanthemums only, was one shown by Mr. Hatch, which consisted of plants having fully developed blooms, and it was not too formal.

Mr. Rooke, gr. to Messrs. Brickwood & Co., Southsea, was the most successful in the class for a group of miscellaneous plants.

Specimens plants of Chrysanthemums were well staged by Mr. Penfold and Mr. G. Lambert, Bognor, the former winning for large-flowered varieties, and the latter for Pompons; in no case was the training too formal.

Plants for table decoration such as Primulas and Solanums were capitally represented.

Fruit of the bardy section has never been seen in Portsmouth in such quantity and of such good quality before.

Mr. H. J. Jones, Ryecroft Nursery, Hither Green, Lewisham, had eleven dozen blooms of Japanese Chrysanthemums, staged in threes of each kind, "not for competition," which made a good display.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

FROST IN NOVEMBER.—Can any fellow-reader inform me where I can find the record of Sir Robert Christison's observation that a frost in the first week of November is always or usually followed by a mild winter? Here, in Gloucestershire, we had 7° of frost on the night of the 30th. H. E.

EPILOBIUM LATIFOLIUM.—Can any reader of the *Gardeners' Chronicle* tell "E. B. B." whether *Epilobium latifolium* is in cultivation in England? At one time it was not uncommon, and Wheeler of Warminster always kept it in stock. As a low-growing creeping plant it was useful and pretty, but he has not seen it for many years.

MARKETS.

COVENT GARDEN, November 2.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, &c.]

PRICES RISE AS LAST WEEK.

POTATOS.

Arrivals are not quite so heavy, and a better demand for good samples. Prices about same as last quoted, except for ordinary kinds, which are a drug on the market. J. B. Thomas.

SEEDS.

LONDON: Nov. 1.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market idle. Clover seeds for the moment met with scarcely any attention whatever. Orders still come to hand for Winter Tares; the supply seems very nearly exhausted. Seed Rye is firm. No change this week in either Mustard or Rape seed. Canary seed, with a greatly improved consumptive demand, hardens in value. Hemp seed, however, is cheaper. Peas and Haricots, owing to the colder weather, move off more freely.

FRUITS AND VEGETABLES.

BOROUGH: October 31.—Quotations:—Cabbages, 3s. to 6s.; Savoys, 4s. to 6s.; Cauliflowers, 5s. per tally; Turairs, 1s. 6d. to 2s.; Carrots, 2s. to 3s.; Parsley, 2s. to 3s. 6d. per dozen bunches; Onions, 5s. to 6s. per bag; Apples, 2s. to 8s. per bushel.

SPITALFIELDS: October 31.—Quotations:—Cabbages, 3s. to 6s.; Savoys, 4s. to 6s.; Cauliflowers, 5s. per tally; Turnips, 1s. 6d. to 2s.; Carrots, 2s. to 3s.; Parsley, 2s. to 3s. 6d. per dozen bunches; Onions, 5s. to 6s. per bag; Apples, 2s. to 8s. per bushel.

FARRINGTON: Nov. 2.—Quotations:—Sprouts, 1s. 6d. p r half-bushel; 6 peck cases, 6s. to 6s. 6d.; Carrots, 3s. 6d. per sack; Beans, 2s. per bushel; Cauliflowers, 1s. 6d. per dozen; Cabbages, 9d. to 1s. do.; Apples, cooking, 2s. 6d. to 3s. 6d. per bushel; do. Ribston, 4s. 6d. per bushel; do., King Pippins, 4s. 6d. per bushel; Grapes, barrels, 10s. to 11s. 6d. per barrel; do., hot-house, 10d. per lb.

STRATFORD: Oct. 31.—There has been a good supply of all kinds of produce at the above market during the past week, and a brisk trade was done at the undermentioned prices:—Cabbages, 1s. 6d. to 3s. 6d. per tally; Savoys, 2s. to 5s. 6d. per tally; Cauliflowers, 6d. to 1s. 6d. per dozen; do., 2s. 6d. to 7s. 6d. per tally; Turnips, 1s. 3d. to 1s. 9d. per dozen bunches; do., 30s. to 40s. per ton; Carrots, household, 45s. to 52s. 6d. per ton; do., cattle-feeding, 27s. 6d. to 35s. per ton; Parsnips, 6d. to 1s. per score; Mangels, 2s. to 27s. per ton; Swedes, 25s. to 28s. per ton; Onions, English, 15s. to 180s. per ton; do. Dutch, 6s. to 6s. 6d. per bag; Apples, English, 2s. 3d. to 4s. 6d. per bushel; Brussels Sprouts, 1s. 3d. to 1s. 9d. per half-sieve; Celery, 9d. to 1s. 3d. per roll; Horseradish, 1s. 4d. to 1s. 8d. per bundle.

POTATOS.

BOROUGH AND SPITALFIELDS: October 31.—Quotations ranged between 40s. and 110s. per ton.

STRATFORD: Oct. 31.—Quotations:—Magnums, dark-land 40s. to 45s.; do., upland, 45s. to 60s.; Sutton's Abundance, 70s. to 75s.; Bruce, 50s. to 70s. per ton.

FARRINGTON: Nov. 2.—Quotations:—Sutton's Abundance, 70s. to 75s.; Main Crop, 70s. to 80s.; Bruce, 55s. to 60s.; Magnums, 45s. to 55s. per ton.

LONDON AVERAGES: Nov. 1.—Hebrons, 80s. to 100s.; Regents, 60s. to 80s.; Magnums, 40s. to 65s.; other kinds, 40s. to 60s. per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 140s. to 155s.; new, do., 125s. to 145s.; inferior, do., 100s. to 120s.; Hay, best, 145s. to 170s.; inferior, do., 90s. to 100s. New Mixture, 115s. to 130s.; and Straw, 35s. to 58s. per load.

THE WEATHER.

(By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

DISTRICTS.	TEMPERATURE.				RAINFALL.	BRIGHT SUN.			
	ACCUMULATED.								
	Above 42° for the week ending October 28.	Above 42° for the Week.	Below 42° for the Week.	Above 42° difference from Mean since January 1, 1893.

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, R.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending October 28, is furnished from the Meteorological Office:—

"The weather during this period was very wet in the extreme north and north-west, heavy rain falling almost daily; in the more southern and eastern districts, however, the rainfall was slight and infrequent, and several fine and dry intervals were experienced.

"The temperature continued above the mean in all districts, the excess ranging from 1° in England, E. and Ireland, S., to 2° or 3° elsewhere. The highest of the maxima were recorded, as a rule, either on the first or last day of the week, when the thermometer rose to 66° in England, N.W., to 61° in England, N.E. and the Channel Islands, and to between 57° and 60° in all other districts, excepting Scotland, N., where the highest reading was 55°. The lowest of the minima occurred on the 27th, and ranged from 31° in England, N.W., and 32° in Scotland, N. and Ireland, S., to 30° in England, N.W., and to 41° in the Channel Islands."

"The rainfall greatly exceeded the mean in Scotland, N. and W., and slightly in Ireland, N., in Scotland, E. the fall was just equal to the normal, while in all the other districts there was a large deficit. Some of the falls experienced in the north and west of Scotland were unusually large; thus, on the 24th, as much as 3.38 inches was measured at Glencarroo, 3.25 inches at Fort William, and 2.32 inches at Fort Augustus.

"The bright sunshine was more prevalent generally than it was during the preceding week; it exceeded the mean in most of the 'wheat producing' districts, and showed a deficit in nearly all the 'grazing districts.' The percentage of the possible amount of duration ranged from 41 in England, N.E., to 32 in Scotland, E., England, S., and the Channel Islands, to 17 in Ireland, N., and to 11 in Scotland, N."

NOTICES TO CORRESPONDENTS.

(Published by Blackie & Sons, Edinburgh.) *Manual of Orchidaceous Plants*, still being issued. (J. H. Veitch, Royal Exotic Nursery, Chelsea, S.W. Sold at same place.) *Choicer Stove and Greenhouse Flowering Plants*, 3rd edition, by B. S. Williams, Victoria and Paradise Nurseries, Holloway. (Sold and published by the same.) *The Orchid Growers' Manual*, 6th edition, by B. S. Williams, Holloway. (Sold and published by the same.) *Select Ferns and Lycopods*, 2nd edition, by B. S. Williams, as above. *Thomson's Handy-book of the Flower Garden*, 4th edition (Blackwood & Sons, Edinburgh and London). *My Gardener*, by H. W. Ward. (Published by Eyre and Spottiswoode, East Harding Street, London, E.C.) *The Fruit Manual*, by Dr. R. Hogg, 5th edition. (Published and sold at 171 Fleet Street.) *How to Lay-out a Garden*, by E. Kemp. *Alpine Plants*, by David Wooster. (Published by G. Bell & Co., York Street, Covent Garden, W.C.) *Manual of Forestry*, by Dr. Selchik (Bradbury & Co.). *Vines and Vine Culture*, by A. F. Barron, and to be obtained from him at the Royal Horticultural Society's Garden, Chiswick). *A Manual of Conifers*, by H. J. Veitch, Royal Exotic Nursery, Chelsea, S.W.—*Hertsfordshire*. There are not, so far as we are aware, any books that treat of the dressing of farm and garden seeds. It is a business of itself, which must be learned in the usual way.

CELERY: *C. B.* The head of Celery, the heart of which was decayed, and the base surrounded by a crop of strong suckers, swarmed with insects in variety, and wire-worms and other worms. Most of them are such as abound in manure and heavily-manured ground, but, with the exception of wire-worms, we cannot say that they are injurious to Celery, although they might, with their burrowings and excrement, render the soil sour and more unhealthy than it is. Having grown Celery in the same trenches for three years would of itself account for the state of the soil, without taking into account the layer of dung 10 inches deep that was yearly put into the trenches, and the Clay's Maure, and the cow-shed drainage, &c. Good gardeners do not grow wholesome vegetables in this fashion. You should find a fresh place another year for your Celery, and be content with a 5 inch layer of manure, which should be covered with 4 or 5 inches of mould, shovelled down from the sides of the trench, not dug up from below. To get rid of the worms, insects, &c., you could try the effect of clear lime-water.

CHRYSANTHEMUMS: *A Constant Reader*. Six varieties for cut flowers:—Ebine, Madame C. Audiguier, Gloriosum, Edwin Molyneux, amongst Japanese; Mrs. Rundle and Queen of England amongst incurved varieties. Six varieties to grow in pots:—Val d'Andorre, Criterion, Thunberg, Baron de Prailly, Lord Alcester, and Jardin des Plantes.

GARDENERS' CHRONICLE FOR SEVEN YEARS: *C. F.* You might perhaps obtain £3 for them, unbound; or, at another time, only the price of waste paper. It will be better if you advertise them.

DENDROBIUM NOBILE: *K. F. G.* The plant having completed its pseudobulbs or stems for the season, should be gradually brought to rest by removing it to a less warm house, and withholding water, also gradually. It may be rested in a dry state, in a temperature of 50° to 55°. If the plant gets no rest and you keep it in heat, it will flower very early and weakly, probably.

INSECTS: *Beetle*. The weevil on imported Phalaenopsis Schroderi is Baridius aterrimus, C. Waterhouse, originally described from specimens sent from Singapore, where they were most destructive to Phalaenopsis and other Orchids. The other insect is one of the "Diamond Beetles," and is known as Entonus imperialis, R. McL.

MARKET GARDENERS' ACT, 1893: *J. B.* Sold by Messrs. Eyre and Spottiswoode, Government Printers, London.

NAMES OF FRUITS: *J. Mc. F.* 1, rotten; 2, Duchesse d'Angoulême; 3, Comte de Lamy; 4, Beurré d'Aremberg; 5, Passe Colmar; 6, Josephine de Malines.—*J. F.* 1, Verulam; 2, Glou Morceau; 3, Comte Pendu Plat; 4, King of the Pippins; 5, Rymer; 6, King of the Pippins.—*T. O.* 1, Berga-

motte d'Esperen; 2, Glou Morceau; 3, Cornish Gilliflower; 4, Sops in Wine.—*H. T. Reader*. 7, Dutch Mignonne; 8, Scarlet Nonpareil; 9, Early Nonpareil; 10, Alfriston (?); 11, Holland Pippin; 12, Bedfordshire Foundling.—*F. W. Vokes*. 8, Cellini; 9, Hawthornden; 10 and 12, Royal Somerset; 11, Cornish Gilliflower; 13, Golden Noble.—*O. Harvey*. 1, Beurré de Jonghe; 2, Glou Morceau; 3, Royal Somerset; 4, King of the Pippins; 5, Reioette van Mons; 6, Five Crown Pippin (?).—*Rev. C. C.* The yellow Pear, Maréchal de la Cour; the green, Triomphe de Jodoigne, very large.—*J. R. G.* 1, Haawell Souring; 2, Tibbet's Pearmain; 3, Golden Noble; 4, Dutch Mignonne; 6, Kentish Codlin; 5, not recognised.—*J. Wood*. 1, overripe; 2, Duchesse d'Angoulême; 3, Gloria Mundi; 4, Claygate Pearmain; 5, Blenheim Orange; 6, Rymer; 9, Norfolk Beefing—*S. P.* 1, Marie Louise d'Uccle; 2, Broom Park; 3, Doyenné du Comice; 5, Marie Louise; 6, Ne plus Meuris; 7, Winter Nelis; 8, Duchesse d'Angoulême.—*J. W.* 1, 2, Emperor Alexander; 3, Court of Wick; 4, Duchesse d'Angoulême; 5, Bergamotte d'Esperen; 6, Josephine de Malines; 7, Napoléon.—*G. M., Wantage*. 1, Pear, Passe Colmar; 2, Beurré Rance; 3, Bishop's Thumb; 4, Soldat d'Esperen; 5, King of the Pippins Apple.—*S. R.* Pear very much rubbed and bruised, not recognised.—*N. C., Headingley*. Grape, Madresfield Court.

NAMES OF PLANTS: *E. W. P.* The hard brown seed, Staphylea pinnata. The other is insufficient for identification.—*Bridget*. Aster N. A. pulchellus.—*A. J. Z.* Asters: 1, Tradescanti; 2, N. B. Flora; 3, N. A. roseus. 4, received in poor condition; probably Chrysogonum heterophyllum.—*Thyne & Paton*. Asters: 1, ericoideis; 2, vimineus; 3, acris; 4, N. A. pulchellus; 5, N. B. Robert Parker; 6, N. A. roseus.—*T. H. Hill*. The pink flower is Habrothamnus fasciculatus, the small unflowered shoot, Diplacus glutinosus; the other a species of Bignonia, but we cannot say which one without flowers.—*C. F. Osmanthus Aquifolium* var. myrtifolius.—*J. B. & Son*. Reineckia carnea variegata.—*Correspondent*. Passiflora alata.—*G. M. C.* 1, Bulbophyllum imbricatum; 2, Maxillaria picta; 3, Saccolabium bellinum.—*H. M.* 1, Adiantum hispidulum; 2, Adiantum concinnum; 3, Adiantum decorum; 4, a form of Adiantum cuneatum; 5, Davallia bullata; 6, Davallia tenuifolia; 7, Pteris serrulata major; 8, Pteris cretica cristata; 9, Davallia platyphylla; 10, Pteris crenata; 11, Pteris adiantoides.—*No Name*. 1, Eulalia japonica; 2, Eryngium amethystinum; 3, Carex variegata; 4, Hedera Reigneriana; 5, Hedera Helix argentea marginata.—*W. S. A., Havick*. 1, Hedera Helix aurea; 2, Probably the arborescent form of 3, which is known in gardens as Hedera chrysoarpa.—*T. S., Rochdale*. The specimens sent are all immature examples of Crotons, Dracæas, &c., which cannot be determined.—*C. F., Runcorn*. A form of Adiantum capillus-veneris magnificum.—*J. Johnson*. Cypridium Rothschildianum.—*M. K. G.* 1, Adiantum æthiopicum; 2, Adiantum elegans; 3, Erica melanthra; 4, Asplenium bifforme; 5, Adiantum capillus-veneris magnificum; 6, Pteris cretica Mayii; 7, Pteris cretica.—*Rev. S. N. T. Yea*; your plant is commonly known as the Moon-flower. Its proper name is Ipomœa Bona Nox.—*E. Lazenby*. Cassia corymbosa.—*T. D.* 2, Sansiviera zeylanica; 3, Reineckia carnea variegata; 4, Eucharisa sps. send when in flower; 5, Sparmannia africana; Begonias cannot be named from leaves only.—*J. L.* Passiflora alata.

OLEANDER: *G. H.* Cuttings may be taken of mature leading shoots, and struck in warmth under a bell-glass, or they may be rooted in bottles half-filled with water and hung up in a warm place—the first is the better way. The tree may be kept in a partially-lighted cellar, if it be cool and dry, or under the greenhouse stage provided it can be kept dry. The plants require but little water during the winter, but they must not be allowed to become parched, and if the young shoots become shrivelled, the ball should receive a good watering. Start the plant into growth in April, and keep it in a well exposed part of the greenhouse till the middle of June, when it may be placed out-of-doors in the full sun. It must be well watered when in full growth, and fed either with a mulch of sheep-droppings, decayed pigeon-dung, or manure-water. The chief things to be observed are to get good long shoots, to well ripen these, to keep the plant out of the reach of the frost during the winter, and afford it but little water at that season. You should not have potted the plant at

this late date, but just when growth recommences. However, if the potting was very firmly done, no harm may arise, provided you carry out the above directions.

SHRUBS FOR AN AVENUE IN THE MIDLANDS: *J. B.* *Flowering Deciduous:* Lilac in many varieties, Philadelphus (Mock Orange), Coronarius microphyllus, &c.; the Quince, two varieties; Siberian Crabs, many varieties; Pavia macrostachya, the Medlar, Iibiacus, Laburnums in variety, Colutea arborescens, Common and Spanish Broom, Viburnum opulus (Snowball Tree), V. lantana, V. macrocarpa, Pterocarya caucasica, Sea Buckthorn, Berberis communis, Hamamelis virginica, Haleaia, Cornus mas (Cornelian Cherry), Cerasus padus (the bird Cherry), Amelanchier canadensis, Thorns of all kinds. The above are not expensive, and they are procurable in any good nursery. *Evergreens* might consist of the Colchic and round-leaved Laurels; Portugal Laurel, Hollies, green, gold, and silver varieties; Rhododendrons, ponticum and hybridum; Andromeda, Kalmias, Ledums, Menziesias, Ericas, Berberis Aquifolium, Garrya elliptica, Chinese Privet, Spurge Laurel, Arbutus Unedo, Phillyrea, Laurustinus, Juniperus tamariscifolia, J. prostrata, Retinospora in variety, Osmanthus ilicifolius, and many more.

STOCKS FOR THE MORELLO CHERRY: *P. S.* The Mahaleb having failed as a stock in your clayey soil, although a heavy soil suits that stock, you might try the Sweet Cherry stock instead. Is your land well drained? the appearance of the foliage pointing to a water-logged soil.

SWEET WILLIAMS AND FUNGUS DISEASE: *C. S.* It is the ordinary Puccinia arenaria, known at one time as Puccinia lychnidearum. There is no certain cure except by rooting up the infected plants and burning them. *M. C. C.*

TREE GUARD AGAINST STOCK, HARES, AND RABBITS—Several correspondents having desired information regarding the protection of fruit trees in orchards, shrubberies, and other places not secured

FIG. 95.—FREE GUARD.

a, the tree; b, the rods; c, the blocks between the rods.

against the entry of animals, we append a cut (fig. 95), of a neat and effective guard suitable for standard and half-standard trees. The rods used should be of dried Ash, Hazel, or Chestnut, with the bark left on. See also *Gard. Chron.* for Oct. 28, p. 539.

CANNELL'S CHRYSANTHEMUMS.

Our Collection and Stock are much the largest and best kept in the world—400 New and 1000 Old Varieties now ready to be sent to all parts in the finest possible condition. We never grow for competition, all energy is devoted to stock, consequently the successes of our Customers are unprecedented.

The following speak volumes:
 Mr. H. S. JAMES, Curator, Hamilton Botanical Gardens Victoria, Australia. Sept. 20, 1893.
 "Your Chrysanthemums helped me splendidly at our chief show, beating hitherto the best growers here."
 Tasmania Horticultural Society, Hobart Town. May 4, 1893.

"W. Fildecope, Esq., has for the fifth time in succession, carried off the Gold Medal for plants supplied to him direct from us. This we believe to be totally unprecedented in exporting plants."

"Mr. Kerslake, gardener to William Von der Heyde, Esq., who carried off all the most valuable prizes, including the Cup, at the Sydney Chrysanthemum Exhibition, held in May, 1893, the competition being much keener than on previous occasions."

The above simply shows that those in Europe will be equally as successful with our Plants and Cuttings. Send for ours, the best Illustrated and Descriptive Catalogue, post free.

H. CANNELL & SONS,
SWANLEY, KENT.

FERNS A SPECIALITY.

Our Stock is immense, consisting of over 1000 different kinds of Stove and Greenhouse Ferns, and over 400 kinds of Hardy Ferns. THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered

HOT-WATER BOILERS,

Others with TUBES, SHELVES, & HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

— FRONT ELEVATION —

— LONGITUDINAL SECTION —

— SECTIONAL PLAN —

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped hack. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

PRUNING MADE SAFE AND EASY!—**THE STANDARD MANUFACTURING CO., DERBY,** beg to announce that they have just completed several valuable improvements and additions to their already world-renowned series of Pruning and Horticultural Appliances. One is styled the "EULCRA" Tree Pruner, which is capable of cutting a branch midway between the sizes that the "Standard" and Giant Tree Pruners will cut, and with the same ease and efficiency. Another is arranged to work with a spring and cord, enabling it to be in jointed sections any reasonable length. It can also be supplied without pole, an advantage if required for export. Our new Patent Combined Branch and Vine Pruner and Trimmer and Fruit Gatherer commends itself for being instantly adjustable for the double purpose. Also the new Patent "Easy" Weed Destroyer, for applying weed-killing compounds without stooping or soiling the hands. Illustrated Price Lists of the above, and our other well-known Specialties in Pruning and Gardening Appliances, will be sent post-free by us or our Agents—The Principal Ironmongers and Seedsmen, the leading Stores, and kindred trades at home and abroad.

 ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.
 Dear Sirs,—It affords me much pleasure to inform you the
 25 ft. Annular Sail Windmill, on 40 feet timbers, working a
 set of 3 in. x 9 in. stroke treble pumps, that you fixed here
 for Baron Schröder, is giving very great satisfaction, pumping
 the water through 4,224 feet of pipe, to a vertical height of
 about 80 feet. I must also express my thorough appreciation
 of the manner in which the whole of the work has been so suc-
 cessfully carried out.—Yours faithfully,
 H. BALLANTINE, Head Gardener to Baron Schröder.
 We have a similar Mill and set of Pumps in hand for Lord
 Northbourne.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—**F. SANDER AND CO.**, St. Albans.

E. P. DIXON AND SONS, Hull, will be pleased to recommend as GARDENER, or GARDENER and BAILIFF, to any Lady or Gentleman requiring such, a really first-class Man, and one of the best Growers in the county. He is in the prime of life, and of most reliable character, &c.

GARDENER (HEAD), where two or more are kept; age 30.—**Mr. WILLIAMS**, Wessington Court, will be pleased to recommend his late Foreman—**J. DEAN**, Manor House, Eaton Bishop.

GARDENER (HEAD).—Age 37; Scotch.—Twenty years' practical experience in good establishments, including Orchids, Stove and Greenhouse Plants, Fruit, and Vegetables. Energetic and persevering. Twelve years Head. Good references.—**G. S. S.**, Drummond's, 58, Dawson Street, Dublin.

GARDENER (HEAD).—The Trustees of the late Alderman Sidney can strongly recommend his Gardener, who lived with him fourteen years. Thoroughly experienced, trustworthy, and reliable. Land and Stock if required.—**W. WILSON**, Bowes Manor, Palmer's Green, N.

GARDENER (HEAD WORKING), where four or more are kept.—Age 40; twenty-six years' practical experience Inside and Out. Eighteen years in last situation.—**G. BARTLE**, 18, Brown Lane South, Beeston, Notts.

GARDENER (HEAD WORKING), or good SINGLE-HANDED.—Age 39, married, no family; experienced in all branches.—**GAY**, 53, Foreign Street, Loughborough, Camberwell, S.E.

GARDENER (HEAD WORKING), where two or three are kept.—Married; twenty-five years' experience. Fifteen years in present situation; highly recommended.—**GARDENER**, Tollerton Manor, Nottingham.

GARDENER (HEAD WORKING).—Age 27; Mrs. F. M. NELSON, Hangerhill House, Ealing, W., will be pleased to recommend Arthur Pentney, who has served in these gardens as Foreman three and a-half years, and now seeks an engagement as above.

GARDENER (HEAD WORKING).—Age 42, married, one boy 15 years; life experience. Fifteen years as Head. Twenty years' first-class reference. Special in Ferns, good at Wreath, Spray, and Button-hole Making, and a good all-round man.—**J. D.**, 8, Howley Street, Lambeth, S.E.

GARDENER (HEAD WORKING).—Married, no family; thoroughly experienced in all branches, Inside and Out.—**E. MONTAGUE**, 21, Flask Walk, Hampstead, N.W.

GARDENER (HEAD WORKING); age 36.—Mrs. BAGOT LANE will be pleased to recommend her late Head Gardener; twenty-two years' experience, eight years in last situation. Good references.—**J. L.**, Mr. Barratt, Lower Leigh, Stoke-on-Trent.

GARDENER (HEAD WORKING).—Age 42, married, no family; practical experience in all branches of Lady or Gentleman's establishment. Life experience.—**F. WELLBELOVE**, Bodicote Grange, Banbury, Oxon.

GARDENER (HEAD WORKING).—Age 32; married, three children; experienced with Vines, Peaches, Stove and Greenhouse Plants, Flower and Kitchen Gardens.—**VERNON**, Purbright, Chipstead, Surrey.

GARDENER (HEAD WORKING).—Age 30, married when suited; thoroughly experienced in Vines, Melons, Stove and Greenhouse Plants, Orchids, Flower and Kitchen Garden. Good testimonial.—**H. L.**, The Gardens, Ampfield House, Romsey, Hants.

GARDENER (HEAD WORKING).—Age 31. Experienced in Vines, Melons, Cucumbers, Tomatos, &c., Stove and Greenhouse Plants, Flower and Kitchen Gardens; good References.—**A. BOOKER**, Mr. Cole, The Vineyard, Feltham, Middlesex.

GARDENER (HEAD WORKING).—Age 40, married, two daughters. Thoroughly experienced; four years Head in present Gardens, six previous. Land and Stock. Good references from present and previous employers.—**J. I. BARLEYCORN**, Fowley, Liphook, Hants.

GARDENER (HEAD WORKING); age 30.—**Mr. McCULLOCH**, Head Gardener and Forester to Sir Alexander Acland Hood, Bart., M.P., St. Andries, Bridgewater, wishes to recommend his General Foreman, Ernest Williams, as above, who has been with him seven years, as a good all-round Man, well up in his duties; excellent character from employer. Reference as above.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 31, married, one child (age 3). Thoroughly experienced; good character.—**GARDENER**, 6, Caird Street, Queen's Park, London, W.

GARDENER (good SINGLE-HANDED).—Age 24, married; eleven years' experience in all branches. A gentleman wishes to recommend the above.—**GARDENER**, Mr. James Poulter, Great Sheiford, Cambridge.

GARDENER (SINGLE-HANDED).—Age 29, married, no children; three years' good references. Ten years' experience. Leaving through establishment being reduced.—**T. EARWICKER**, 13, Devon Villas, Gillingham, Kent.

GARDENER (SINGLE-HANDED, or good SECOND).—Age 25, single. Ten years' practical experience. Well recommended.—**F. NOWELL**, 333, Upland Road, Dulwich, S.E.

GARDENER.—Age 30, married; enthusiastic and successful cultivator of Fruit, Flowers, and Orchids. Fourteen years' good practical experience in all-round Gardening. Abstainer.—**SAUNDERS**, 48, Campsbourne Road, Hornsey, N.

GARDENER.—A GENTLEMAN wishes to hear of situation for his Gardener, who has been with him three years. Understands Glass-houses, very industrious, and a thoroughly handy man.—Apply, **F. C. HOLLAND**, The Rectory, Petworth.

GARDENER (SECOND, or SINGLE-HANDED).—Age 23, married, no children; nine years' experience Inside and Out. Good references.—**A. G.**, The Gardens, Grove-lands, Southgate, N.

GARDENER, FOREMAN, or good SECOND.—Age 27; two years as Foreman in last place. Highly recommended.—**T. WINSLADE**, 11, Corbyn Street, Horsesey Road, Finsbury Park.

GARDENER (good SECOND); age 26; thoroughly experienced, Inside and Out.—**Mr. BRADBY** will be pleased to recommend as above, **R. LIMON**, Knights, East Finchley, London, N.

GARDENER (SECOND), in a small place.—Age 23; six and a half years' experience. Good references. Abstainer.—**A. GRAY**, 2, Southampton Buildings, Lymington, Hants.

GARDENER (UNDER).—Age 17; strong and willing. Well recommended.—**H.**, The Gardens, Missenden Abbey, Great Missenden, Bucks.

GARDENER (UNDER), in a good establishment.—Age 22; Inside, or Inside and Out. Good references.—**W. B.**, Lytchett Minster, Poole, Dorset.

GARDENER (UNDER), Indoors and Out.—Has good character.—**J. P.**, Coppards Bridge, Chailly, Sussex.

TRAVELLER or MANAGER, or both.—Would be glad to hear of an engagement for some good firm. Has hitherto done a good trade through most of England and Scotland. Can show all business done by him for his late employers if necessary. Late with Messrs. Pitcher & Manda, Disengaged through their giving up their business in this country. Testimonials of the highest order.—**S. JOHNSON**, 8, Gloucester Place, Windsor.

MANAGER.—Wanted management of an up-to-date London Market Nursery, or a go-ahead provincial Nursery, or charge of a branch place. Thorough practical knowledge of all details of the business. Good address.—**E.**, 152, City Road, London, E.C.

To Nurserymen, Seedsman, and Florists. **MANAGER**.—Age 31; one who has been accustomed to a high-class business for many years, Superintendence of Office-work, Head Salesman, Stove, Greenhouse, and Hardy Plants. Undeniable testimonials.—**B.**, 2, Nevil Villas, Cbeatenham.

FOREMAN, MANAGER, PROPAGATOR.—Age 33, married; thoroughly experienced in Vines, Tomatos, Cucumbers, Ferns, Orchids, and Palms. Good references from present and previous places.—**G. GOODCHILD**, 11, Foreign Street, Camberwell, S.E.

FOREMAN (GENERAL).—Age 28; fifteen years' experience. **B. ASHTON**, Glossop Hall, Derbyshire, can strongly recommend a first-class man to any Gardener in want of such. Protestant.

FOREMAN (GENERAL, or Plant and Fruit); age 24.—**GEO. ABBEY**, Avery Hill, Eltham, Kent, can highly recommend **W. Bishop**. Eleven years experience in first-class situations, including two here.

FOREMAN.—Age 23; excellent recommendations and references.—Apply to Messrs. **R. VEITCH**, New North Road Nurseries, Exeter.

FOREMAN.—Age 26, English. **Mr. WARD**, Head Gardener to Lord Dunleath, Ballywalter Park, co. Down, Ireland, can with confidence recommend his late Foreman as a thorough practical man, of excellent character and ability. Thirteen years' experience. Five years previous as Foreman.—**GEORGE ALLIBONE**, 98, Saltisford, Warwick.

FOREMAN (GENERAL).—Age 30; twelve years' experience in Orchids, Fruit, Stove, and Table Decorations. Two years' present character. Life abstanter.—**THOS. BROCKBANK**, 10, Ulric Street, Camberwell, S.E.

FOREMAN (good GENERAL).—Age 26; ten years' experience. Good Plant and Fruit Grower. Good character and testimonials.—**W. H. WATERS**, Charlton Road, Keynsham, near Bristol.

ROSE GROWER, Inside or Out.—Has been many years a successful exhibitor at the National and provincial Shows. Good references.—**A. B. C.**, 8, Parliament Street, Small Heath, Birmingham.

JOURNEYMAN (Inside and Out), under a Foreman.—Age 23; seven years' experience. Good character from present employer. Bothy preferred.—**W. LEVETT**, Bennhall Lodge, Saxmundham, Suffolk.

JOURNEYMAN, Inside or Out.—Age 18; three years' experience. Total abstainer. Can have good character.—**H. STOPPS**, Church St., Woking Village, Surrey.

JOURNEYMAN, Inside; age 23.—**Mr. J. THOMAS**, Shardeloes Gardens, Amersham, Bucks, can strongly recommend his First Journeyman, who has left through a reduction of hands. First-class references.—Apply to **Mr. J. THOMAS**.

JOURNEYMAN, Inside, under a good FOREMAN.—Age 23; eight years' experience. Leaving through a death.—**F. BOURNE**, Lladley Hall Gardens, Nuneaton.

JOURNEYMAN, Inside or Out.—Age 23; nine years' experience. Good reference.—**W. E. SMITH**, 84, High Street, Sydenham, S.E.

IMPROVER; age 18.—**J. THOMAS**, Shardeloes Gardens, wishes to recommend **G. Bellenger** as above. Four years' experience, Inside and Out.

IMPROVER or JOURNEYMAN, Inside.—A young Man (age 18), seeks a situation as above. Nearly four years' experience. Good character. Abstainer.—**T. PEART**, The Gardens, Canon Frome Court, near Leithbury.

IMPROVER.—Wanted, for Youth (age 18), a situation as above in a Nursery. Good knowledge of Garden. Shropshire or neighbourhood preferred; £4 premium offered.—**VICAR**, Bromington, Whitechurch, Salop.

FARM BAILIFF, or Position of Trust.—A Cumberland Man wants a situation as above. Understands Breeding and Rearing of all Farm Stock; also Buying and Selling of same. Good references.—**J. B.**, 8, Croxteth Grove, Liverpool.

TO GARDENERS.—Situation wanted by a youth (age 18), in large Establishment under good foreman. Twelve months character from previous place, Hon. Joseph Chamberlain, Highbury.—**T. TWIGG**, Dyrham Park, Barnet.

TO GARDENERS.—Situation wanted for a Lad (age 16) in the Garden; strong and active; Gardener's son.—**G. PERKINS**, Arthingworth, Northampton.

TO GARDENERS.—Situation wanted for a strong active Lad in the Garden. Age 16. Two years in the Garden, and six months in the Nursery. Gardener's son.—**HEAD GARDENER**, Sundorne East, Shrewsbury.

TO MARKET GROWERS.—Situation wanted, as Cucumber Grower. Age 29; three years' good references. Leaving through establishment being reduced.—**T. EARWICKER**, The Vineries, Gillingham, Kent.

TO NURSERYMEN.—Young man, age 21, seeks permanent situation as Sof-wooded Grower. Nine years' experience, good character.—**H. DOLMAN**, 13, Graham Road, Wimbledon, Surrey.

TO NURSERYMEN and ROSE GROWERS.—A GENTLEMAN in the Trade, who, from unforeseen circumstances, is parting with his Foreman, wishes to highly recommend him to any Nurseryman requiring a man of first-class ability. He is thoroughly acquainted with every department of the business, and many years experienced in Propagation of Roses and general Nursery Stock, of first-class character, highly respectable, and a thoroughly business man.—**W. D.**, 734, High Road, Tottenham, N.

SEED TRADE.—Situation wanted by a young Man, age 20; four years' experience.—**X. Y.**, Fulford Hall Farm, Earlswood, Birmingham.

To Nurserymen, &c. **SALESMAN or CLERK**.—Advertiser seeks situation as above. Well up in all branches of the trade and official duties.—"ACTIVE," 35, Cornwall St., Fulham, S.W.

SAMPLE CLERK and CORRESPONDENT.—Age 23; good experience, gained in first-class Wholesale establishment. Good reference.—**JOHN HUIE**, 5, Buccleuch Place, Edinburgh.

FROM LONDON TO EDINBURGH IN SIX HOURS, is an announcement which a few years ago would have been scouted as false and ridiculous, but this is the age of astonishing inventions, and the speed quoted above will soon be accomplished. A new locomotive is now being constructed so as to be capable of travelling 100 miles per hour. When completed it will be 2,000 horse power, with a boiler pressure of 200 pounds. Quick travelling means increased facilities for business, and it will bring people more closely in social intercourse. Holloway's Pills and Ointment will also have a more rapid sale, for they are increasing in public favour by leaps and bounds, as the best cure for all complaints.

J. WEEKS AND CO., F.R.H.S., CHELSEA, LONDON, S.W.

CONSERVATORIES DESIGNED and BUILT to
SUIT ADJACENT BUILDINGS.

ORCHID HOUSES WITH ALL LATEST

*Horticultural Builders and Hot-Water
Apparatus Manufacturers,*

CHELSEA, LONDON, S.W.

CHARLES P. KINNELL & CO.,

IRONFOUNDERS, ENGINEERS, and BOILER-MAKERS.

ROCHFORD HORIZONTAL TUBULAR BOILER,

BOLTING TOGETHER WITH INDIA-RUBBER RING-JOINT,
MANUFACTURED WITH FLOW AND RETURN
SOCKETS IN ANY POSITION.

This Boiler has special
advantages over any
other of this type manu-
factured; the configura-
tion of the centre casting
divides the top connect-
ing-pipe into two sec-
tions, gives increased
waterway, and is rem-
ovable without taking
off back casting. No
other Boiler has this
advantage.

TERMINAL END AND CHAMBERED SADDLE BOILER.

VERY HIGHLY RECOMMENDED.

This Boiler is of the IMPROVED SADDLE FORM, is
manufactured in Wrought Iron, welded; the back water-
way, against which full force of the fire strikes, and the
centre flue, make this one of the most economical
Boilers extant. Made in all sizes, from 24 to 72 in. long.

CAST-IRON SADDLE BOILER,

WITH WATER-WAY END
and
SIDE-FLUE OPENINGS.

The above is the best of all Boilers of the plain Saddle type. Made in all sizes, from
24 to 66 inches long.

Holding one of the largest stocks of H. W. Boilers, Pipes, and Fittings, in the Kingdom, we are able to execute Orders of any magnitude from London Warehouses, or to despatch direct from
Works without delay. To meet the requirements of our increasing business, we have recently added No. 65, Southwark Street to our London premises, and have now the largest and finest
Show-rooms in our Trade in the Kingdom. Price List illustrating all types of Boilers, Valves, Pipes, Ventilating Gear, and all classes of Horticultural Appliances free on application.

SILVER MEDAL HORSE-SHOE BOILER,

The Best and Most Economical
Amateurs' Boiler Manufactured.

Section of Boiler and Pipes, showing action
of Hot Blast and Automatic Regulator.
Awarded the SILVER MEDAL (FIRST
PRIZE) by the Royal Horticultural Society
in 1883; still stands without rival for—

Power, Efficiency, and Economy.

Patents 10,398.

"GARDENERS' CHRONICLE."

Continued Increase in the Circulation.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of 75 per Cent.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

ADVERTISERS will greatly assist our efforts to get to Press earlier, by forwarding their favours as EARLY IN THE WEEK as possible.

H. CANNELL AND SONS' CARNATIONS and NEW CHRYSANTHEMUMS.—Special CATALOGUE of the above is now ready, and sent post free. It will be found most complete with such valuable information, that it is absolutely necessary all lovers of these two families should possess it at once.

Prize Cob Filberts.

MR. COOPER, Western Elms, Reading (late of Calcut Gardens), is the largest grower of Prize Cob Filberts in the Kingdom; 20,000 fine young Trees now ready for Sale. Pamphlets and Price Lists on Application.

NEW AND MAGNIFICENT CYPRIPIEDIUM CHARLESWORTHII

(ROLFE, N. SP.)

Exhibited and unanimously awarded a First-class Certificate by the Orchid Committee of the Royal Horticultural Society, and pronounced by every one to be the most beautiful and charming Cypripedium introduced, causing quite a sensation at the Drill Hall, on Tuesday, September 26, 1893.

The special feature of this novelty is the dorsal sepal, which is quite distinct in appearance and colour to any other known Cypripedium, which will render it exceptionally valuable to the hybridist.

The *Gardeners' Chronicle* says:—"There was a more than usually interesting show of Orchids, but by far the most novel and beautiful exhibit was a plant of Cypripedium Charlesworthii, Rolfe, n. sp., First-class Certificate, an entirely new species, imported by Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, and exhibited by them for the first time, the exhibit coming in for a great amount of attention and admiration. The plant in growth somewhat resembles C. Spicerianum, and the flowers, which are borne on scapes about 3 inches in height, are unlike any other known species. The beautiful flat, upper sepal is 2½ inches wide, broadly orbicular, white, tinged, and veined over its surface with light rosy-purple; the apex alone showing a white marbling. The lower sepals are about 1 inch broad, greenish-white. The petals, which resemble those of C. insigne, are plain-edged, over 1½ inch long, yellowish, tinged with brown; the lip also somewhat resembles that of the Sylhet form of C. insigne, and is similar in colour to the petals. The saminode is very singular, resembling pure white porcelain, the protuberance in the centre being conical in form, and not a single spur, as in C. insigne. It is an extraordinary and beautiful species."

The *Garden* says:—"A First-class Certificate awarded to Cypripedium Charlesworthii, Rolfe, a distinct and decidedly novel species, which cannot

be compared with any that we can call to mind. The plant is of dwarf habit, the flowers each having a remarkably fine dorsal sepal, extra large, measuring about 2½ inches each way; the colour a pale pink, suffused with purple, and having a lighter network towards the extremities; the petals are shaded with greenish-brown, so also is the pouch, which is rather small. A greater novelty amongst the species of the Slipper family has not been seen for a long time. From Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford."

The *Journal of Horticulture* says:—"A very remarkable introduction from the East Indies; it is a distinct and beautiful species, very dwarf, with long narrow leaves. The flower stem is only 3 to 4 inches long; the lip is short, green, heavily suffused with bronzy-brown, and the dorsal sepal is very noteworthy—it is broad and rounded, and the colouring is a beautiful soft rose, delicately veined; the staminode is pure white. A feature of the leafage are the rows of dots on the reverse side. The species is a great acquisition (First-class Certificate)."

The *Gardening World* says:—"An interesting collection of Orchids was exhibited by Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, including a handsome new species, named Cypripedium Charlesworthii, from the East Indies."

In offering this great novelty, we beg to state that we are the sole importers of this plant. We shall be very pleased to quote size, price, and full particulars. Inspection cordially invited.

CHARLESWORTH, SHUTTLEWORTH & CO., Wilmer Road, HEATON, BRADFORD

CHRYSANTHEMUM CUTTINGS, Early and Late Varieties. Price per 100 or 1000 to SHIPPEYFIELD, Florist, Hampton Hill, Middlesex.

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered

HOT-WATER BOILERS,

Others with TUBES, SHELVES, & HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

FIXED.

THE IMPROVED GARDEN GULLY (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d.

(The larger sizes are very strong for carriage drives.) Full Particulars and Testimonials on application.

CHARLES P. KINNELL & CO.,

IRONFOUNDERS, ENGINEERS, and BOILER-MAKERS.

ROCHFORD HORIZONTAL TUBULAR BOILER,

BOLTING TOGETHER WITH INDIA-RUBBER RING-JOINT, MANUFACTURED WITH FLOW AND RETURN SOCKETS IN ANY POSITION.

This Boiler has special advantages over any other of this type manufactured; the configuration of the centre casting divides the top connecting-pipe into two sections, gives increased waterway, and is removable without taking off back casting. No other Boiler has this a vantage.

TERMINAL END AND CHAMBERED SADDLE BOILER.

VERY HIGHLY RECOMMENDED.

This Boiler is of the IMPROVED SADDLE FORM, is manufactured in Wrought Iron, welded; the back waterway, against which full force of the fire strikes, and the centre flue, make this one of the most economical Boilers extant. Made in all sizes, from 24 to 72 in. long.

CAST-IRON SADDLE BOILER, WITH WATER-WAY END and SIDE-FLUE OPENINGS.

The above is the best of all Boilers of the plain Saddle type. Made in all sizes, from 24 to 66 inches long.

SILVER MEDAL HORSE-SHOE BOILER,

The Best and Most Economical Amateurs' Boiler Manufactured.

Section of Boiler and Pipes, showing action of Hot Blast and Automatic Regulator. Awarded the SILVER MEDAL (FIRST PRIZE) by the Royal Horticultural Society in 1883; still stands without rival for—

Power, Efficiency, and Economy.

Patents 10,398.

" 10,674.

Holding one of the largest stocks of H. W. Boilers, Pipes, and Fittings, in the Kingdom, we are able to execute Orders of any magnitude from London Warehouses, or to despatch direct from Works without delay. To meet the requirements of our increasing business, we have recently added No. 65, Southwark Street to our London premises, and have now the largest and finest Show-rooms in our Trade in the Kingdom. Price List illustrating all types of Boilers, Valves, Pipes, Ventilating Gear, and all classes of Horticultural Appliances free on application.

65 and 65a, SOUTHWARK STREET, LONDON, S.E.; also Branches at GUERNSEY and JERSEY, for CHANNEL ISLANDS.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 11, 1893.

ROSES IN 1893.

WHATEVER may have been the character of the past season, there are some few things which have come out tolerably clearly; in the first place a good deal has been said about the deterioration of Roses, but the past season has brought out very distinctly that some of our oldest Roses are as good as ever they were. I think it is very possible that the idea has arisen from the fact that a grower has received some plants which are not equal in strength and freedom of flowering, and I do not see how it can be otherwise. An amateur can easily select the buds which he uses, but not so the nurseryman; he has an immense stock to propagate, and his Rose man cannot stay to examine each shoot that he cuts. He leaves out, no doubt, what he considers weakly ones, but he cannot afford the time or care to select them as the amateur does; the consequence is, that many buds are used which a private grower would reject, and from these come the plants that lead the amateur to believe that Roses generally deteriorate. I have combated the same notion as to the Gladiolus, and am persuaded that my contention with regard to that flower is correct. The past season has shown us some of our oldest flowers in grandest form. Let us take a few of these:—Beauty of Waltham, which was sent out from Waltham Cross upwards of thirty years ago, was shown as well as it has ever been; General Jacqueminot, which came out ten years before that, is as bright and clear as ever; Horace Vernet, one of the late M. Guillot's Roses, more than a quarter of a century in cultivation, attracted the attention and drew forth the eulogiums of all who saw it; the bloom for which the Messrs. Harkness & Sons carried off the Silver Medal at the Crystal Palace (the best hybrid in the nurserymen's class) was a marvel of beauty, of colour, form, and size. I do not say it was the best Horace Vernet ever shown; there rise up before me in memory the many gorgeous blooms which I have seen, but I can say this, that I have seen few that could surpass this perfect flower. Then, again, Prince Arthur, a very near relative of Gen. Jacqueminot, sent out by Mr. B. R. Cant, fully maintained its reputation. It is remarkable that three out of every four Roses which I have mentioned, are dark flowers, which we did not expect would have been so good in such a season as the past.

Then, again, I think that 1893 has shown us in an increased degree the value of Tea Roses; truly, like all Roses, their first blooming season was comparatively brief, but when July rains came, they made a grand start for growth, and during the months of September and October quantities of good—and even exhibition—blooms could be gathered; and although the closing days of the month have come with a sharp touch

of frost, they are still making a great effort to bloom. Even now, on November 1, there is a prospect of bloom should the weather continue fine. No doubt they have rejoiced in the bright sunshine, and have well repaid any care bestowed upon them; and after such a splendid October as we have had, we may hope they will be found in good condition for another year.

Again, I have been struck by the remarkable recuperative power of the plants of Roses generally. My small collection consists exclusively of dwarfs, and when I looked on my beds in July, and saw very little sign of those strong shoots upon which we depend for the next year's bloom, I began to think with many of my fellow rosarians, that pruning would be a comparatively short work. In this, however, I was mistaken; some, it is true, have not made strong growths, but, on the other hand, shoots of from 5 to 7 feet long are to be found, and this notwithstanding that all my plants were lifted last autumn, and so a check was given to them. Truly, wherever dwarf plants are used, one need never despair after the severest winter or driest summer, of seeing vigorous and healthy shoots. It has not been a favourable season for the purely garden Roses; there are always June Roses, and consequently this season were soon gone; the beautiful single Roses especially, always short-lived, were more so than usual in 1893. It is true that Lord Penzance did exhibit some of his most interesting hybrids, but not at all in the same manner as in the previous year; enough, however, was seen of them to show that in the year to come they will be to all who can afford them space a source of much pleasure. Some of the best of his varieties have passed into the hands of Messrs. Keynes, Williams & Co., and will be sent out next year. These garden Roses are coming more and more into favour, though I do not think they are ever likely to oust the many grand exhibition varieties in growth. Any of these two are of a climbing character, and consequently require more room than many amateurs are able to give to them; but all will at any rate try to find a place for Mr. Turner's Crimson Rambler. The season so utterly exceptional was sure to produce some curious results in the way of prize-taking; there have been seasons when a strong amateur has "made a rush" at the beginning of the season and continued it until the end, but it has not been so this year; it was not one favourable to amateurs, and consequently they can give no such record. It was otherwise with the professional grower; before a show was held, all who talked over the subject said "This will be a year for the Yorkshire men," but I do not think that anyone anticipated such a record as that of Messrs. Harkness & Sons of Bedale. They commenced showing on June 24 at Reigate, and ended their season on September 1 at Haydon Bridge; during that time they had exhibited at every principal Rose show in the kingdom, including two National Rose Society's shows, Bath, Gloucester, Hereford, Manchester, Woodbridge, Earl's Court, and Chiswick, and carried off every 1st prize for 72's that was offered, both of the Challenge Cups of the National Rose Society, the Chiswick, Woodbridge, and two other cups, one gold medal, and eight silver. This is a record which no firm has ever equalled, and which the Yorkshire one will certainly never exceed. I should like also to mention the success obtained by Mr. Mount of Canterbury, not because it at all equals that of the firm already alluded to, but because it shows what pluck and energy can do in a season so unfavourable to a southern grower. If these prizes were mainly gained in a class in which the northern firms were deficient, namely Teas and Noisettes, commencing on May 9 with 48's, and ending July 17 with Halifax, he went north, south, and west, exhibiting in good form at all the principal shows, and securing a large number of 1st and 2nd prizes, and, indeed, I recollect seeing a very good stand of his at the Agricultural Hall on August 26.

In one respect the season has been favourable to the various Rose societies in the kingdom, in that

the exhibitions were almost uniformly held in brilliant weather, the one exception being, I believe, the day on which the National Rose Society held its northern show at Worksop; and yet with all I am afraid that many of them are in a very shaky condition, some of them being in a moribund state, even if they have not already passed into non-existence. As these die out, however, ever and anon some fresh ones occupy the vacated posts; they, too, will flourish for awhile, and then, when changes take place in the *personnel* of the officials or exhibitors, they, too, will succumb—still, I hope that the interest, to which all parts of the kingdom bear witness, will help to maintain the Rose in the proud position it has already reached, and that the day may be far distant when the Rose ceases to be in all respects the Queen of Flowers. *Wild Rose, November 1.*

NEW OR NOTEWORTHY PLANTS.

LÆLIO-CATTLEYA × ALBANENSIS,

Rolfe, nat. hyb.

ANOTHER very interesting natural hybrid has appeared among importations from Bahia, this time in the establishment of Messrs. F. Sander & Co., of St. Albans. The two previously known ones are *Cattleya × Whitei*, derived from *C. Schilleriana* and *C. Warneri*, with which it was found growing in company, and *Lælio-Cattleya × Gottoiana*, derived from *Lælia tenebrosa* and *Cattleya Warneri*, which appeared in an importation of the former. The present one is also a *Lælio-Cattleya*, as is evident from its very unequal pollinia; and *Cattleya Warneri* again suggests itself as the only possible *Cattleya* parent. The second parent was evidently *Lælia grandis*, which grows in the same district. The hybrid has longer pseudobulbs than *Cattleya Warneri*, which it otherwise much resembles in habit. The flowers are nearly 5 inches in diameter, the sepals and petals light rosy-mauve, the front lobe of the lip rosy-crimson, and the disc purple-crimson, with some similar radiating veins extending towards the rosy-lilac margin. The sepals are linear-lanceolate, $2\frac{3}{4}$ inches long, and $\frac{3}{4}$ inch broad, with revolute margins; the petals rhomboid, very undulate, and $1\frac{1}{2}$ inch broad, and the lip entire, crispo-undulate, and $2\frac{1}{2}$ inches long. The smaller flowers and very undulate petals show the influence of *Lælia grandis*, while the colour approaches that of *Cattleya Warneri*. The plant is evidently intermediate between the two species named, which grow in the same country, and thus the origin of the hybrid is pretty evident. It is a very interesting and handsome plant, whose appearance throws considerable light on the habitat of *Cattleya Warneri*, which hitherto has not been clearly defined. *R. A. Rolfe.*

FURCRAEA ALBISPINA, Hort. Palermo.*

This plant is now flowering for the first time at Kew, with the other *Furcraeas* and *Agaves* in the Cactus-house. It was received under the above name not long ago from the Botanic Garden of Palermo, but I cannot find that the name has ever been published. It is one of the dwarf kinds, allied to *F. depauperata* and *undulata*, and it is not likely that it would be of any use for fibre purposes. We do not know its native country, but doubtless it is Central America.

Leaves fifteen to twenty, in a sessile rosette, 1 to $1\frac{1}{2}$ foot long, 2 inches broad at the middle, moderately firm, dull green, smooth on the face, scabrous on the back; marginal prickles small, deltoid, greenish-white. Peduncle, exclusive of the panicle, 5 feet long. Panicle rhomboid, the longest central branches not more than 6 to 8 inches long; flowers all solitary, pendulous. Ovary glabrous, nearly 1 inch long. Perianth-segments oblong-

* *Furcraea albispina*, Baker, ex Hort. Palermo.—Acaulis, foliis 15–20 dense rosulatis ensiformibus suboriaceis sordide viridibus pedibus vel sesquipedalibus facie levibus dorso scabris aculeis marginalibus parvis viridibus; pedunculo 5-pedali; paniculae ramis patulis semipedalibus; floribus solitariis; perianthii segmentis oblongo-lanceolatis viridulo tinctis.

lanceolate, white, tinged with green; the outer $\frac{1}{2}$ inch broad at the middle, the inner $\frac{1}{2}$ inch. Stamens half as long as the perianth-segments. *J. G. Baker.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA LABIATA VAR.

A SINGULAR flower of *Cattleya labiata*, which it is probable may be borne more or less habitually by the plant from which it was taken, comes from Mr. Wm. Hamilton, gardener to Hamar Bass, Esq., Birkley Hall, Burton-on-Trent. The segments are all as broad as the petals usually are, the three upper ones resembling petals, and the three lower ones labellums. That is to say, the upper sepal has assumed the form of the petals, and the two lower sepals that of the labellum, even to the crimping of the margins and the yellow colour extending upward from their bases. Its colour is very bright, and if it keeps constant, it will be a singular novelty. It was obtained out of an importation by Messrs. F. Sander & Co.

From various correspondents come flowers of *C. labiata*. One of three (No. 1), all good, from the collection of J. Broome, Esq., Sunny Hill, Llandudno, who grows his *Cattleyas* and *Lælias* to a high state of perfection, is the richest in the colour of its labellum of any, the front lobe of the lip having the rich dark velvety purplish-crimson of *C. Hardyana*.

CYPRIPEDIUM LEEANUM ×.

In the race for the newest thing the above beautiful crossbred Orchid is not so often lauded as are others which in beauty are its inferior. There exists great variety in it, it having been raised independently in several places, and the progeny vary according to the qualities of the varieties of *C. insignis* and *C. Spicerianum* made use of. Several very distinct forms are flowering in Mr. G. C. Raphael's collection, Castle Hill, Englefield Green. One form is in colour like the original *C. × Leeanum*, but the flowers are much larger, while another has the large white upper sepal marked with lines of purple blotches over the greater part of its surface, resembling in that respect *C. × L. Masereelianum*, but the colour is brighter than in that variety and more as in *C. × L. superbum*.

VANDA CERULEA, BURMESE VARIETY.

Vanda cerulea is a widely-distributed species, and the quality of the flowers varies much, according to the district in which they were collected. The best that I have observed, taking an entire importation, is the Burmese variety, and the best and most beautiful example of *V. cerulea*, a plant which is at present flowering in Mr. Raphael's collection, Castle Hill, Englefield Green. All the segments are as nearly circular as their slightly-stalked bases will admit of, and each segment overlaps the other, so as to form a perfect flower, rather more in breadth than in length. The upper sepal and the petals are of a bright violet-blue colour, with slight patches of white showing between the veins. The lower sepals are white, closely veined and shaded with blue, and the labellum is dark violet. It is difficult to imagine a more beautiful flower. It was imported by Messrs. Hugh Low & Co., of Clapton. *J. O'B.*

HOW MAY CHRYSANTHEMUM EXHIBITIONS BE IMPROVED?

A good deal was written a year or two ago about the size of the stands for exhibiting cut blooms of Japanese Chrysanthemums; it even went the length of papers being read, and discussions raised thereupon. This was all very well as far as it went, but it did not go far enough. The newer introductions of the Japanese varieties are mostly considerably larger than those which have been in cultivation for some years previously, and when these immensely large flowers were arranged in ranks upon the stands without any foliage, they were in many instances

crushed in so closely that the form of the flowers could not be observed by the judges. Under such circumstances, it did not need a very long paper, nor much discussion, to find a remedy. The usual regulation-stands were too small, and needed enlarging. This was an improvement in that direction, but it was not enough, and many Chrysanthemum amateurs are not satisfied with the formal way of staging the flowers in long ranks denuded of every bit of foliage, and in many instances the groups of plants are as formal as the cut flowers. The plants are placed close together, the stems oftentimes being denuded of leaves, so that the dwarfier plants are required to hide the bare stems of the taller ones behind, and the flowers at the top are placed almost as closely together as those in the stands—a really artistic group is seldom seen. I am not inclined to blame either gardeners or amateurs for any shortcomings in respect of the way in which the flowers and plants are exhibited, and it may be that many difficulties

wooden or tin cup, and if it is an incurved bloom, the centre of it and many of the petals have to be pulled out. The art of dressing is quite as essential as the art of cultivating the plant. The late Mr. Edward Saunderson and his brother Charles were both adepts in the art of dressing; their patience was remarkable. Mr. Edward told me that he worked upon one bloom an entire afternoon before he had the petals arranged to his satisfaction. In the natural arrangement I have alluded to, the dressing was out of the question. There was no room for blocks and cups with other etceteras; there was a ground-work of fresh green moss, and besides the foliage of the flowers, a small Palm or Fern was dropped in here and there, with the russet autumn tints of trees and shrubs. The 1st prize collection was from Mr. E. Rowbottom, gardener to H. R. Williams, Esq., The Priory, Hornsey, and was greatly admired. A member of the committee of the National Chrysanthemum Society, who admired

single Chrysanthemum blooms, the flowers as tastefully arranged as it was possible for them to be, three blooms in a bunch. This stand was exhibited by a well-known grower, Mr. Geo. Carpenter, it contained Bezie Conway, with white flowers, the tips of the petals lightly tipped purplish; Miss Crisay, bright chestnut-brown; Mrs. D. B. Crane, peculiar pinkish-salmon; Sir T. Symonds, yellow; Miss U. Wilde, purple, the base of petals white; Miss Mary Anderson, pinkish-blush; Rev. W. Renfrey, crimson, tinged claret; Purity, with tips of petals incurved; Jane, pure white, and of this a yellow spot was shown; Oceana, blush; Lady Churchill, bright reddish-brown, peculiar fluted petals. The above lot of single varieties in triplets formed the prettiest exhibit in the show, and it is easy to see how vastly the flowers would have been improved had they been set up on a groundwork of green moss and foliage, instead of upon a painted board.

The public who visit Chrysanthemum exhibitions are ever craving after something new, and a repetition of the same dull uniformity year after year soon ceases to please, interest, or instruct; so that, even taking it upon the low standard of the commercial aspect, it would be to the interest of exhibition promoters and managers to improve or add something new to the exhibitions. Good culture will always have to be the primary object in view, but the best cultivated flowers may have their beauties sadly marred by being badly set up; and I am convinced if the interest in Chrysanthemum exhibitions is to be sustained, that some improvement must be made in the manner of exhibiting cut blooms, and the best way to obtain this is to note any new and good thing in exhibiting, and add them to the schedule. *J. Douglas.*

AMERICAN PARKS AND GARDENS.

(Continued from p. 553.)

DOSORIS AND HYDE PARK.—“Have you spent much time in the neighbourhood of New York?” asked the interviewer of Mr. Nicholson on the occasion of his recent journey.

“Not so much as I should have wished to spend. I was entertained for a day by Mr. Charles A. Dana at his beautiful home on the island of Dooria, on the north shore of Long Island, where he has a wonderful collection of trees and shrubs. There are many things which are thriving here which will not grow further north. The grounds are rich in Conifers, and in rare exotic trees which have been collected from all parts of the world, and the collection is well cared for by his head gardener, William Falconer, who is another old Kew man. Mr. Dana is one of the most intelligently-interested men on the subject of trees and tree-planting that I have met in America, and his example ought to be of great service to American horticulturists.

“Very enjoyable, too, was a trip I made up the Hudson River to Poughkeepsie, and then by carriage to Hyde Park, the old estate now possessed by Mr. Walter Langdon, but which was planted by the famous French landscape gardener, Parmentier, for Dr. Hossack, in the early part of this century. Its age gives it a special interest in a country where everything looks so new to a visitor from the Old World. The place contains many fine old trees, notably one of the best Gingkos I have seen here. There is a splendid growth of Chestnut, Oak, White Pine, and Hemlock, and the best example of Pitch Pine which I have ever seen. The situation, on a natural terrace overlooking the river, with a distant view of the Catskills towards the north, and an equally attractive outlook down the river, is unsurpassed in grandeur and beauty. It is a place which every Englishman who visits New York should see, for its natural features are superior to those of any place which I have visited, and its original beauties have been carefully preserved and emphasised by judicious and skilful management. It is certainly an admirable example of landscape gardening on a broad scale, where appropriate foregrounds have

FIG. 96.—CATTLEYA LABIATA. (SEE P. 594.)

will crop up in the way of the managers of Chrysanthemum exhibitions when an effort is made to alter the present system of exhibiting. The best way would be for local societies to do a little each year in the way of introducing a more natural system, especially in the classes for cut flowers. A most successful attempt was made this year by the Highgate Chrysanthemum Society. They offered prizes for a collection of twelve varieties of cut blooms arranged in bunches, limited to five blooms in each bunch, the flowers to be shown with their own foliage, and the foliage of other plants to aid the effect at the discretion of the exhibitors. The new departure (although this is not the first year) has been a decided success. The arrangement of the flowers which obtained the highest awards was admirable. They were good examples of the best varieties of Japanese and incurved, each flower being cut with stems 1 foot in length, less or more, and furnished with bright green foliage; and here came in the first improvement, for the first time an exhibitor of cut flowers on the old system does is to strip off all the beautiful leaves, the setting of the jewel—the flower. The next process is to shave off the nodes on the stem, so that it may pass into the stem of a

the group as much as I did, thought it would be well if the National Society would follow the example of Highgate, and offer prizes for similar classes. The 2nd prize group was also worthy of high commendation; it was put up by W. S. U. Hayter, gardener to Wm. Hannaford, Esq., Tenterden Hall, Hendon, and the exhibitor kept more to the lines of the schedule, which was to exhibit the blooms in bunches as cut from the plants. In fact, there was some suggestion that the 1st prize lot should have been disqualified, because the exhibitor had not adhered strictly to the terms of the schedule, by distributing his flowers too much, and did not strictly confine them to bunches. I think when an artistic arrangement of flowers is contemplated, it would be a grave error to fetter the exhibitor. I would suggest that each one have a certain space allotted to him on the table, and that he fill it with flowers and foliage in any way he pleases. I am writing this with the Highgate exhibition fresh in my memory, and to-day I noted at the Crystal Palace exhibition a number of stands of Pompon Chrysanthemums arranged as the flowers always are, with long stems and fresh green foliage. Besides the Pompon varieties, there was also a stand of

been prepared for the magnificent distances. It seems a pity that this estate could not be preserved for public use as an example of domestic rural landscape, in connection with a noble river and equally noble mountain ranges."

Parks in America.—Something having been said in regard to city parks, Mr. Nicholson said: "I went to Central Park on the first morning after my arrival, and the superintendent, Mr. Parsons, very kindly accompanied me to points where I was enabled to get the most comprehensive view of it. Certainly your city may well be proud of it, because it is as perfect an example of pastoral scenery as can be conceived of in the heart of a great city. The art which has provided such a sense of spaciousness and breadth within such contracted and rocky limits is certainly admirable. The masses of flowering shrubs are in my view an admirable feature of your park, and they are growing remarkably well. There are few of what are known as bedding plants in it, and these seem to be in their proper places. Among the flowers the Water Lilies were especially attractive, because it was the first time I had seen them in such perfection in the open air. I found afterwards in Washington, and especially in the parks of Chicago, however, that they were equally well and perhaps better grown in those cities. In my view, however, the plantations seriously need thinning, and many of the trees should be cut out. They were originally planted too thickly, and they have been left to crowd each other already too long. You cannot grow six trees on thin soil where there is only room or nutriment enough for two, any more than you can bring up a family of half-a-dozen children on food which two healthy ones could consume. The Conifers seem to be short-lived here, and the increasing smoke and dust, as the city thickens about the park, will make it still more difficult to grow them in the future, and it seems to me that most of the Norway Spruces should be rooted out at once. Unfortunately, my visit to Prospect Park was made the morning after the cyclone struck it, and it was strewn with branches of trees which the wind had wrenched off, but I could see the beauty of great stretches of meadows with the old native trees on their borders. This was peculiarly beautiful to me, because it is the nearest approach to what is known as park-like scenery in England that I have seen in this country. The great open meadow of Washington Park, Chicago, which contains 100 acres, is larger than any other I have seen, but the bordering trees have been trimmed up from the ground so that the visitor can see under them from the roads, and the indefiniteness and mystery which the boundary plantations should furnish are lost. The trees in Lincoln Park have been abused by the axe in the same way, much to the regret of the present competent superintendent, Mr. J. A. Pettigrew, who is doing all he can to correct the errors of his predecessors. Morning-side Park in this city was a great surprise to me. I had scarcely ever heard it named, and yet it furnishes an opportunity which any enterprising planter would long to embrace. In other places rocks have been piled up to the height of a few feet at great expense, but here Nature has given you these noble bluffs facing the east, where could he made the noblest rock-garden in the world.

"Perhaps I ought to add here that the exhibition of North American woods in the Museum of Natural History, adjoining Central Park, was of great interest to me. I am familiar with the principal botanical museums of Europe where such exhibits are displayed, and it is within bounds to say that the forest wealth of no other country is anywhere displayed so completely as that of America in this museum. The collection is more remarkable since it represents the products of all America north of Mexico, a great region, which has many distinct climates and floras. The people of New York are no doubt proud of this collection, but the entire United States have reason to be so, because it is in every way a national collection. One of the things which has struck me in America was the fact that,

among the rich men of the country, there are so many public-spirited citizens who are willing to expend their money for the general enlightenment of the people. The name of Mr. Jesup, of whose generosity the collection is a monument, will always be gratefully remembered by lovers of trees and students of dendrology." *New York Daily Tribune.*

(To be continued.)

CHRYSANTHEMUMS ABOUT LONDON.

RVECROFT NURSERY, LEWISHAM.—Wonderful has been the growth and development of this Chrysanthemum nursery, belonging to Mr. H. J. Jones, and situate at Hither Green, about 1 mile from Lewisham Junction. No energy, skill, or money has been spared in bringing the collection into the front rank, and the position it holds, and the extraordinary display now to be seen here, cannot but be a source of very great satisfaction, not to say pride, to the proprietor. When notice was made of this nursery last season in our columns, it was one of the finest in town; but this year, in addition to the home collection, the whole of the stock belonging to Messrs. Pitcher & Manda, Hextable, Swanley, Kent, has been purchased, representing 3000 plants, and including a first-rate lot of seedlings and novelties, which have been selected from the whole of the United States by the American branch of the firm. The American seedlings are much more disposed to "novelty" production than our own, and are sure to contain more first-class varieties than are evident even now. At the present, the whole collection may be seen at its best; the choicest and best plants have been placed in a span-roofed house by themselves, and number nearly 4000. The arrangement is a decided improvement upon that usually followed, and a serpentine walk through the centre takes the place of a straight one. Such a floral feast can rarely be seen as is presented, and the immense number of seedlings and novelties is far beyond the possibility of notice here, so we must confine ourselves to some of the more prominent ones, as seen on the 31st ult.

Primrose League is a seedling primrose-coloured Japanese only just christened. The flower is very large, and the florets are much after the style of Florence Davis in habit, and recurved slightly at the points; it is a very pretty flower, and will become popular. Comte F. Lurani (Japanese) is rose-coloured, shaded white, petals broad, and flower very full in centre; one of last year's continental varieties. A very fine reflexed Japanese is Rosy Morn; as we saw it there were four very fine blooms of good depth on a plant—in colour it is rosy-pink. President Borel is a reflexed Japanese of brightest rose, with pale yellow centre; a very fine flower. Creole is an American-raised Japanese, having very broad petals, and the deepest-coloured variety we have yet seen. Thomas Hlayler, one of last year's production, is a loose-habited Japanese, the florets falling down almost perpendicularly; in colour it is magenta, with silver reverse, and is very distinct. Then is very striking splendid yellow Japanese, called The Tribune, which received a Certificate from the National Chrysanthemum Society this season; the yellow is almost primrose, and changes to white, and the flowers are large, with florets broad and incurving.

Dr. H. D. Hull is one of the American seedling Japanese, of very distinct appearance in colour, which is almost white, excepting a faint heliotrope bluish. Madame Octavie Mirbeau is a Japanese of continental origin, white and rose, edged with amaranth; the florets are very long. Mrs. Hillier is a large deep Japanese, cream-coloured, with golden centre; and Majestic, a new American variety, something like Hamlet, but of better colour and longer petals. A very pretty Japanese raised here, cream, with yellow centre, has been named Mrs. H. J. Jones. One of the seedlings from the Hextable collection has been named Golden Plume, and will be much liked as a good yellow, broad-petalled Japanese. Silver Cloud, a new American

variety is of very distinct appearance, and the colour indescribable; it would be white, but for the very faintest flush of some form of red. A good flesh-coloured one has been named after Mr. Whittle, the clever Chrysanthemum grower at the Right Hon. Mr. Goschen's seat at Shirley. Mrs. Denne is an incurved Japanese of violet-rose, with very long florets. Whole batches of the splendid golden sport from Vivand Morel, called Charles Davis, are here; it is a very fine acquisition, and it received a First-class Certificate when shown by Mr. Jones. The most distinct of all the hairy novelties we have seen this season is one called Hairy Wonder. It is a Japanese, very hirsute, and in colour a kind of red-chestnut; this will be sure to please the admirers of this section.

The number of incurved novelties is never large, but there are several to be seen in this collection. The first place may be given to a white English-raised seedling not yet named; it has splendid form, and is pure white, but in size it will, no doubt, improve another year. Santel of '93 is named after the raiser, and is a first-rate hairy incurved Japanese. The hairs are on the reverse, and consequently displayed; in colour it is magenta, with silver reverse. Brookleigh Gem, another new one of this section, is a curious mixture of white and violet.

We noticed no new one in the Anemone section or Pompon, but a good decorative variety of golden-yellow, which does not show the centre at any stage, has been called Mrs. Jewell; the flowers are round and deep. Of the unnamed seedlings we cannot speak, except to say that they are numerous, and of the most promising appearance. Other new ones that may be seen elsewhere, such as J. Shrimpton, G. W. Childs, Beauty of Exmouth, Col. W. B. Smith, Lord Brooke, F. Jameson, Baron Hirsch, &c., are all well done, as are also the best of the older varieties.

Chrysanthemum-lovers should not by any means lose so valuable an opportunity to study a fine and complete collection.

THE EARLSWOOD NURSERIES, LTD.

A call at Mr. Wells' nursery at Earlswood, near Redhill, showed that a large number of plants have again been raised this season. The plants are not grown so much with a view to exhibition as for the supply of cut flowers, and accordingly many of the plants have not been subjected to the amount of thinning generally practised. A large quantity of Miss Marechaux, a marble-white incurved variety, is grown for giving blooms at Christmas—as many as 1000 plants are kept for this purpose; also a number of a white Japanese seedling of last year, which has been named Flossie, are kept for a similar purpose. Mr. Wells thinks that this will prove to be one of the very latest of this section. The bloom is a good one for decorative purposes. A seedling incurved may be good another year, but at present it would be unfair to judge it, the plant being but weak. Roslyn is a very large American seedling of last year, of shrimp-pink, rather coarse-looking, if big flower.

The collection contains most of the newer varieties, but Mr. Wells' chief interest appears to be in the production of new single varieties, a section which he thinks might be accorded a little more general cultivation. They are certainly very pretty, and make up much more lightly for small arrangements or for the dinner-table than any of the others. One of the best of these, although not new, is Miss Mary Anderson, a pure white one, which, together with a variety called Miss Rose, a pink flower, has been used as a parent in much of the crossing. Roumania is rose-coloured, shaded white; and Emily Wells, a fine large pink variety. Yellow Jane is a good old yellow sort, and Rev. W. E. Renfrey, a deep crimson. Carrie Wells is very fine—it is crimson, with pale gold reverse. Princess May is one of last year's seedlings—in colour it is crimson-amaranth, and the richest of any single. Foxhunter, a seedling just named, is very red, with the tip of each floret gold-coloured. A pretty magenta flower is Bertha Jinks, and the florets curl attractively. One of the

best of last year's new ones is Purity, of pure white, florets broad, and slightly incurving; eye green and large, habit dwarf and sturdy.

WOODHATCH LODGE, REIGATE.

There are few who take a greater interest in their garden than does T. B. Haywood, Esq., of Woodhatch Lodge, near Reigate. Although extremely fond of Orchids, and possessing several houses containing capital specimens of choice species, his interest extends to all of the plants he cultivates, and particularly to Chrysanthemums, in which he is ably seconded by Mr. C. J. Salter, a most skilful and energetic gardener. The two houses in which these are just now arranged present a most magnificent display, the plants are splendidly grown, the blooms large, well-finished, and of good bright colours. Of course the collection consists of the choicest varieties only, and many seedlings of different growers that have sent them to be tested under Mr. Salter's careful treatment. Every season sees the suppression of some varieties whose only fault is, that another one has arisen which has taken the place of the discarded one, and in a better degree. At the same time, however, old varieties, if good, are not slighted in order to make much of novelties, unless they can show undoubted superior merit. Thus, many old favourites are to be seen, whilst some novelties that are now included will be denied another season the favour so lately accorded them.

In noticing a few of the varieties, therefore, we shall include some that are well known, and which attracted as much attention as the new ones. That first-rate white Japanese, Miss Anna Hartshorn, was in fine form, with good rich-looking florets; the variety seems likely to hold its place for a considerable time. Close to this is the golden or bronze sport from Viviani Morel, named Chas. Davis, true to the type in everything but colour, and an acquisition. Next there is Mrs. Harman Payne, bearing huge flowers of white and rose; and E. Molyneux, really fine blooms, of exceptional colour; as are also those of W. H. Lincoln, a sterling yellow, and producing, as many of the plants do here, four blooms in the place of the usual exhibition three. Harry Balsley is a new pink flower; it may make something another season, but at present it is too early to say. Col. W. B. Smith is quite distinct from every other variety, and at present is extremely popular. Excelsior is the name of a new Japanese that promises to be good another season. Florence Davis was looking capital, the blooms possessing a wonderfully fresh appearance. Mrs. Gov. Eifer is a new American Japanese, of creamy white; and there are good but medium-sized blooms of Etoile de Lyon, of exceptional colour. J. Blenkinsop is a lovely colour, but it appears to lack size. John Shrimpton and W. Seward were both present, and in good condition. Judging from some plants in small pots that had been struck very late, both of these varieties are especially suitable for such purpose. They had been thinned to one bud, and the bloom in most cases was as large and good as on the large plants. Condor and Stanstead White, both worthy varieties, were represented by capital blooms; Louis Boehmer and the others of this section were noticeable. The incurved flowers were rather later, and were not quite so large as is usual here, but they had the appearance that they might be so in a week or so. Lord Brooke is a truly handsome flower; the broad stiff florets are a grand colour. Mrs. Colman, Queen of England, Mrs. Heale, Baron Hirsch, Prince Alfred, Mr. Bunn, and Lord Alcester were the most noticeable.

It was pleasant to find such a nice collection of the Anemone-flowered varieties, for they are seemingly neglected in many places, although for our own part they appear to be quite worthy of a place and attention. Mrs. Lowe is a fine yellow variety. Lady Margaret, a magnificent white flower with cream cushion. La Marguerite is a dark red compact bloom; and Sabine, a very pretty yellow. M. Judge Benedict, Delaware, Grand Alveole, and Duchess of

Devonshire, are all good varieties. Cincinnati is a pretty white and rose flower. Beside the Chrysanthemums there was a span-roofed house containing a grand display of zonal Pelargoniums in bloom, a house of Bouvardias, and many other interesting groups of plants. In the Orchid-houses were splendid flowering plants of *Masdevallia tovarensis*, a good spike of *Vanda cœrulea*, and some blooms of *Dendrobium Phalaenopsis*.

THE ROYAL GARDENS, FROGMORE.

The chief attraction at the Royal Gardens at the present time, as in many other establishments of more humble ownership, is the display of Chrysanthemums and zonal Pelargoniums, although the wonderful collection of Pines may be said to be worth seeing at any time. Mr. Owen Thomas has made much of the Chrysanthemum this season, and has produced a very fine display in two span-roofed houses.

The varieties are fairly representative, and include the whole of the new ones possessing extra merit. There are many handsome exhibition blooms, although in a good number of cases there are as many as five on each plant. The most remarkable of them all is undoubtedly that magnificent incurved variety, Lord Brooke, which was represented by blooms as good as we could wish, and when seen thus, what a charming flower it is. Another good thing—Colonel W. B. Smith—is always admired, but it certainly gains nothing by being placed near Lord Brooke, the colour of which is such as makes Colonel W. B. Smith appear "washed." The white variety of Louis Boehmer was exceedingly good; and the pale yellow, large-flowering Primrose League, had two very fine flowers, and is thought much of. Mlle. Marie Hoate, although not new, is one of the most attractive of the white Japanese, its florets are wide, and the appearance handsome. Viviani Morel was capital, and the bronze sport Chas. Davis had very good flowers. Excelsior is a new one, much prized, blooms very large, magenta, with silver reverse. Violet Rose is a Japanese of splendid form, and in colour is a combination of violet and rose. A fine-coloured Japanese is Centenary, and the old fimbriatum looked pretty and light. Six good blooms of G. C. Schwabe proved what an excellent carmine-rose variety it is. Ada Spaulding, too, was remarkably well done, and bore very fine flowers; and the pretty rich cream-coloured Kate Morsel is very popular at Frogmore. Ada Prass is a remarkable flower, both in size and in width of the florets, and is a very delicate flesh colour.

Wm. Seward was a little past its best, but the delicately pretty Moonlight, of very light cream, was charming; J. Shrimpton and S. C. Childs were also included among the new ones, and near them was one called Belle Hickey, a lovely white, in which all the florets except the extreme outer ones are incurved.

The incurved varieties are not so plentiful as Japanese, here, as in most other places, they being less adapted for decorative work. Amongst these, the excellent Lord Alcester was noticeable, and the old Barbara was in good form. Golden Beverley, too, is a capital flower, of rich golden buff; and Miss Haggas is a yellow one, but considerably lighter in shade. Amongst the Japanese Anemone varieties, Madame R. Owen looked very fine; it is pure white, but very curiously in one instance two-thirds only of the bloom was white, and the remaining third quite rose-coloured, the line of union being very sharply defined, and the colour continuing from the circumference to the centre. Several of the best of the singles are also grown, including the best of all, Miss Mary Anderson.

A decorative variety Mr. Thomas recommends as specially suitable for late work is Golden Gem, bronze-crimson, changing to pure yellow, and which can be had until January; it has been Certificated on two occasions.

Amongst the miscellaneous plants, which included a large number of late-struck plants in 6-inch pots, and only about 18 inches high, was Frogne, one of the strongest violet-scented varieties we have seen.

As was mentioned above, the display of zonal Pelargoniums was very cheering, and they will, together with the Chrysanthemum, form excellent material for the embellishment of the conservatory when the Court removes to Windsor, as is expected towards the end of this month. The plants are well grown, the varieties not novel, but good. A seedling pink double, of which there were several plants, appeared to be a good thing, quite as meritorious as any of that colour we can remember.

CHISWICK NOTES.

CHRYSANTHEMUMS IN THE ROYAL HORTICULTURAL SOCIETY'S GARDENS.—A large and interesting collection of Chrysanthemums is in bloom in the Royal Horticultural Society's Gardens at Chiswick. The large vinery, and what was formerly the Palm-house, is filled with plants, not grown in exhibition style, but with few stoppings of the shoots. The result is, they are a mass of bloom, at least those in full flower, and many kinds not usually seen in ordinary gardens are grown. This display is one of the finest near London, and the spacious vinery lends itself to such a collection of flowering plants. It is impossible in a note to mention many varieties, but those who wish for really free and good showy kinds cannot do better than look over the plants to get those colours that please most. It is very difficult to judge from big blooms at an exhibition. It is not always the new kinds that are the most beautiful. We were charmed with the old *Triomphe de la Rue des Châlets*, and such a lovely kind as the reflexed *Elsie*, which is utterly spoilt by getting it too large; the flower is neat and delicate, primrose-yellow in colour. Condor is very fine, the broad flowers with rose-magenta shade; and others remarkably free and distinct in colour are Beethoven, yellow shaded into a bronzy colour; Mlle. Lacroix, one of the best of all for growing for effect; W. Stevens, rich orange and chestnut; Jas. Salter, W. T. Boyes, a pure white and very free Japanese kind; Miss Gorton, Lady Selborne, Stanstead White, O. J. Quintus, Phœbus, brilliant yellow; Florence Percy, Albert Victor, crimson-purple; Margot, and the Pompon *Elise Dordan*, which is very showy when grown freely; it is covered with the neatly-shaped pink flowers. Great credit is certainly due to Mr. Barron for getting together such a large collection, and growing them well. *Visitor*.

THE WHEAT CROP OF 1893.

It would give me much pleasure to be able to record an abundant crop of Wheat in this, the jubilee year of the Rothamsted Wheat-field, instead of which the crop is not only one of the worst which we have ever grown, but it will also, I fear, prove to be to the English farmer a crop of very low acreage value. The circumstances, however, under which our crop has been grown are very peculiar and somewhat obscure, and make it almost impossible to use the results as a basis for estimating the amount of Wheat which the crop of the country will yield.

FLUCTUATIONS AND THEIR CAUSES.

No doubt the majority of readers are chiefly interested in these reports as furnishing a sort of guide to the requirements of the country for imported Corn, but there are others, and I hope an increasing number, who take some interest in what may be called the science of the subject, and wish to know the cause of the violent fluctuations in the yield of a crop, which, both in regard to all the farming operations and to the manures applied, is treated in exactly the same manner every year. Why, for instance, the three artificial manures, which in 1863, the first year of our annual report, gave each of them a crop of fifty-five bushels per acre, are this year giving a produce of a little over twenty bushels?

October, 1892, was a wet month, but the seed was got in just at the end of it under favourable conditions; November was fairly dry, with about an

average temperature; December was a dry month—the first week was cold, with a very low night temperature. This was followed by a fortnight of warm weather, the last week being exceedingly cold, the thermometer registering 17° and 18° of frost. January of this year was rather dry, but very cold, especially during the early part of the month. On the 4th, 5th, and 6th, the thermometer never rose above freezing point, while the night temperature showed on one occasion, 17° of frost. February was a very wet month, with temperature above the average. March was very dry, but the temperature although high for the month, was subject to great extremes, the days being hot, owing to the great amount of sunshine, 198 hours being recorded, and the nights excessively cold. April was almost without rain, with a high day temperature, owing to the large amount of sunshine, 271 hours being recorded. May was also a dry month and very warm, destroying the prospects of the hay crop. June was both hot and dry. In July we had nearly three inches of rain, distributed fairly over the month, and the weather was hot, bringing in a very forward harvest. August was again dry, and a hotter month than July, a temperature of over 90° being recorded by us, and in many other localities. The season is therefore one of a very peculiar character, and is the only instance in our experience in which a dry spring and summer has not produced an abundant Wheat crop.

PRODUCE.

The following Table shows in the usual form the produce of Wheat in 1893, on the selected plots in the field at Rothamsted, which has now grown the crop for fifty years in succession, and it also gives for comparison the average produce of the same plots for ten years, thirty-one years, and forty-one years, 1852 to 1892 inclusive.

Harvest.	Unmanured, Plot 3.	Farmyard Manure, Plot 2.	Artificial Manures.				Mean.	Mean of Plots 2, 4, and 7, 8, 9 (or 16).
			Plot 7.	Plot 8.	Plot 9 (or 16).	Plot 10.

* Equal to 22½ bushels at 60 lb. per bushel.
 † Equal to 29½ bushels at 60 lb. per bushel.
 ‡ Equal to 26½ bushels at 60 lb. per bushel.
 § Equal to 27½ bushels at 60 lb. per bushel.

QUALITY.

The figures in this table appear to confirm, in a general way, the opinion of farmers respecting the crop of the country; that the yield is bad, that the quality of the corn, as shown by the weight per bushel, is exceedingly good, and that the straw is excessively short; all these features are brought out in the table. The permanently unmanured plot gives a produce of

less than 10 bushels, against an average of 12½ bushels during the last ten years. The plot receiving farmyard manure gives 34½ bushels, or a decline of 4 bushels from the average of the last ten years. It is, however, in the produce of the three plots manured with artificial manures that the great falling off in the produce is shown. The mean produce of the three plots gives 20½ bushels per acre against a mean produce of 37 bushels during the last ten years; and the plot which receives the largest amount of manure gives only 21½ bushels, or little more than one-half the average yield during the last ten years, which amounted to 38½ bushels. All the plots give Wheat of very high weight per bushel, none being below 62 lb., and rising to 63½ lb.

STRAW.

The quantity of straw is in every case remarkably small, not exceeding the weight of the grain. In some seasons when the yield of grain is very low, the farmer has some compensation in a large produce of straw; such was the case in 1879, when the grain grown upon the plot receiving the largest amount of artificial manure was nearly the same as it is this year, but instead of growing only 13½ cwt. of straw, it grew nearly 2 tons. Farmers are said to grow Wheat now quite as much for the straw as for the grain; and the very small weight of straw grown this year must, therefore, be a serious loss, coming, as it does, in a season when the hay crop is almost a failure.

EFFECT OF SEASON.

It is generally considered that dry springs and summers are favourable to Wheat, and certainly up to the present year all the dry seasons have resulted in large yields of Wheat in our field. In the present year the drought began earlier and lasted longer than it did in the previous dry seasons. As, however, we had this year in the field adjoining our Wheat-field a very abundant crop of Barley, it is quite impossible to attribute the bad crop of Wheat to the absence of moisture in the soil. The Wheat was sown at the usual time—the last week in October; it came up well, and did not suffer from loss of plant during the severe weather in December and January; in fact, there was up to the time the Wheat began its spring growth a sufficient plant to grow the largest crop all through the season. After the great rains of February had ceased, the artificial manures consisting of salts of ammonia and nitrate of soda were applied in the usual manner. March and April were very dry months, and although the Wheat plant looked healthy, it was noticed that it did not progress in the usual manner, and it was thought that there was some want of action in the manures. In one of our experiments the whole of the salts of ammonia are applied at the time the seed is sown, in order to measure the loss of manure by winter drainage, and in a season like this when so little drainage took place we should expect this plot to yield a crop of not much less than 40 bushels of Wheat per acre, whereas it yielded less than 20. It was evident, therefore, that there was some cause which prevented the manure from acting in the usual manner upon the growth of the crop. Practical farmers are well aware of the fact that during sudden and violent changes of temperature, the soil rises and lifts the Wheat-plant with it, tearing it from the lower roots. Several instances of these sudden changes have occurred this year during the growth of the crop. The beginning of February was warm and wet; but on the 5th, there were 7° of frost, and on the following day 11°. The first half of March was warm and almost without frost; but on the night of the 18th, the temperature fell below freezing-point, and also on each of the nine succeeding nights. On the nights of the 20th and 21st, there were 9° of frost, with sunshine all day and a high temperature. It is probable, therefore, that upon one of these occasions the separation of the plant from the root took place, and the absence of rain in March and April prevented the plant from sending down fresh roots. The men who reaped the Wheat noticed that it had very little hold upon the

ground. It is not difficult to see why the Wheat growing upon land manured every year with farmyard manure should suffer less than that grown in the other parts of the field. Whether this explanation is correct or not, the fact remains, that our crop is a very bad one, as will be seen when we apply the results to the crop of the country.

AREA UNDER WHEAT.

The area under Wheat in the United Kingdom was less than 2 million acres (1 952,476), and if we take the yield of our crop in the usual manner, it amounts to 22½ bushels per acre at 60 lb. per bushel. This will make the crop grown in the United Kingdom a trifle less than 5½ million quarters, and deducting 2 bushels per acre for seed, leaves a crop of 5 million quarters available for consumption. It is estimated that the average number of the population in the middle of the harvest-year (1893-4) will amount to about 38,644,190, and allowing a consumption of 6 bushels per head, our requirements will be very close upon 29 million quarters. It is to be hoped that the Wheat crop of the country may be much greater than my figures indicate, and I certainly place no reliance upon my crop, grown under such exceptional circumstances; but I can quite believe that while in some localities extremely large crops of Wheat have been harvested, in others the yield must be exceedingly small. Whatever the produce of the country may be, one thing is quite certain, that the crop is worth less to the English farmer than any Wheat crop grown during the present century. In the *Mark Lane Express* of October 9, it is stated that the amount of imported Wheat in warehouses at the principal ports in the United Kingdom on October 1, amounted to over four million quarters, while in the same paper it was stated that there were nearly 2½ million quarters shipped, and on their way to this country. Under the influence of these enormous figures, the difference between a good and bad crop of Wheat, however important it may be to the farmer of this country, can have no appreciable influence in the quantities which the world is prepared to send into our ports. During the present year not more than about seventeen out of every hundred of our population will be fed upon bread made from corn grown in the United Kingdom, and as the area to be sown with Wheat will probably be further reduced, we may look for a still greater falling off in the consumption of home-grown Wheat. *J. B. Lawes, Rothamsted, November 2.*

GUNNERA MANICATA.

We have frequently given illustrations of these noble plants, but we think our readers will not complain if we lay before them yet another (fig. 97, p. 589), for which we are indebted to Mr. Burbidge. Anything nobler as a foreground plant cannot be conceived, and when its giant spikes are produced, the effect is enhanced. On the margins of lakes it is quite at home, a rich moist soil suiting it. In curious contrast to the giant species such as *G. manicata* and *G. scabra*, is the little dwarf species known as *G. magellanica*. This may be seen growing in a swamp in the delightful garden of Dr. Allman, near Poole, a veritable treasure place for rare and interesting plants. We see with regret that the name "prickly Rhubarb" has been proposed for these plants. As the plants have absolutely nothing but the superficial appearance of the leaves in common with Rhubarb, and that not universally, the affix of such a name, however tempting, is a real misfortune, as piling up unnecessary trouble and confusion for our successors.

HARD-WOODED GREENHOUSE PLANTS.

(Continued from p. 492.)

BORONIAS.—Since the introduction of *B. heterophylla* and *B. megastigma*, this handsome genus of New Holland plants has become much more popular, and deservedly so. *B. heterophylla* and *B. megastigma* are now frequently to be seen in miscellaneous exhibits during the spring season. No plants merit attention more than these when a great mass of colour is not the primary consideration. It is satisfactory to see that their cultivation in large

numbers has been taken up by the trade growers. In neither case can they be considered fugitive in relation to their blooming period, for if well attended to they will last in good condition at least a month, and if a few plants of each kind be grown it is possible to extend it even more. In a small state they are particularly well adapted for use as vase plants, one plant of *B. megastigma* being quite sufficient to perfume a large room, and in no case have I heard any complaint made against its peculiar fragrance.

B. heterophylla, on the other hand, claims attention by reason of its extremely floriferous character and its bright scarlet-carmine flowers; these are also fragrant, but not in so marked a degree as the first-named kind. Both of the varieties are also useful as plants for the supply of cut flowers for small arrangements, such as button-holes or specimen

than the two first-named varieties. Another kind not now grown much is *B. elatior*; it is in the way of *B. heterophylla*, with rosy-carmine flowers, and forms a good succession to that variety, and is of easy cultivation. *B. Drummondii*, of which there is also a white form, is of slender growth, and a most abundant bloomer—so much so, that it often acts as a check to proper growth afterwards.

As an instance of the long time that sometimes elapses between the discovery of a plant and its introduction into this country, *Boronia heterophylla* may be quoted. It was discovered some forty-five years back in Western Australia, but only introduced into British gardens in 1881, when seeds of it were sent to Kew by Miss North. The other popular variety, *B. megastigma*, is a native of King George's Sound and district, the seeds of which were sent to

such rapid progress. Moderate pruning after flowering in the case of *B. heterophylla* and *B. elatior* may with advantage be adopted, and an occasional stopping of strong shoots during growth. *B. megastigma* can be successfully treated when pruned rather more closely, so as to leave an inch or two only of the previous season's growth, strong shoots being treated as in the former case.

After pruning, each of these sorts will break away all the more freely if placed in a moist growing atmosphere until a good start has been made, when they should be gradually inured again to ordinary greenhouse treatment. These varieties will thrive well when a little fibrous yellow loam is added to the peat, about one-fourth making a good proportion. *B. pinnata*, *B. serrulata*, and *B. Drummondii*, on the other hand, should have peat alone, with silver sand

FIG. 97.—*GUNNERA MANICATA*, IN THE DUBLIN BOTANIC GARDEN, FROM A PHOTOGRAPH SENT BY F. W. HURBIDGE, M.A. (SEE P. 588)

glasses, for when so used they cannot fail to draw attention by their distinct qualities.

B. pinnata, it is to be regretted, is now seldom or ever met with. It is a plant of somewhat difficult culture, but this ought not to be a deterrent to any grower who has a good greenhouse at his disposal. It has never probably been seen in finer condition than when shown by Mr. Thos. Baines in competition for the "Davis Memorial" prizes some years back, when the plants exhibited had to be grown by the exhibitor from the small plant into the specimen. *B. serrulata* is another variety that should receive more attention; it is a slow-growing plant, taking longer to make a fair sized plant than any other. I saw it in large numbers this past spring in Messrs. W. Balchin and Sons' Nursery at Hlassocks, growing well in company with *Leschenaultia biloba major*.

B. serrulata when well-grown makes a beautiful plant, very neat and compact whilst in a small state. Both *B. pinnata* and *B. serrulata* last in beauty a long time, being even more enduring in this respect

the late firm of Messrs. Rollison & Sons by Baron von Mueller. Of this variety, Sir Joseph Hooker says in *Bot. Mag.*, 1873, t. 604:—"The somewhat aromatic fragrance of the flowers resembles nothing known to me; it is most delicious, and though not overpowering, soon fills a large room." In *B. pinnata* the fragrance is very similar to that of the Hawthorn.

In regard to culture, the greenhouse is the most suitable place for them, but they require all the light possible until the proper colour has been imparted to the flowers of each variety, when by using shading to screen from the direct rays of the sun they may be kept much longer in perfection. As regards their treatment, two divisions may be made, *B. heterophylla*, *B. megastigma*, and *B. elatior*, forming one of these; whilst *B. pinnata*, *B. serrulata*, and *B. Drummondii*, constitute the other. The first-named three are all of free growth, although not necessarily vigorous in each case; the latter are more hard and wiry in their habit, and do not in consequence make

—and that of the best quality. These three kinds will not bear the use of the knife so well as the others, and the better way in this instance is to regulate the growth by pinching the strongest shoots whilst still tender, but this even will not often be necessary, save in the case of *B. pinnata*. For these varieties the greenhouse is the best place at all seasons, a close treatment not being desirable. All of them may be stood outside in favorable spots to fully mature their growth before autumn sets in. Overpotting should in all cases be carefully avoided, and firm potting is a most essential point.

The peat used should be of firm texture, and be full of fibre—soft spongy peat ought to be avoided at all times. Nothing beyond clear water is needed for healthy plants, rain or pond-water being the best. The very slightest amount of Standen's Gardeners' and Amateur Friend, as a manurial stimulant has been found useful when the plants, from being pot-bound, showed signs of weakness, or when the soil was not of the very best quality. As in many other

plants, insects are somewhat troublesome, but not seriously so. The worst enemy is the white-scale, and upon such as *B. pinnata*, the red-spider will often appear in hot weather, but it may be kept down by syringing, whilst a well proven insecticide will with patience dispose of the white-scale. In training it should be the aim to dispense with sticks as much as possible. Those used should be of small size, otherwise the growth will not hide them sufficiently. The height should never be encouraged as much as the width of the plants, or in other words, bushy plants should be the object aimed at. The watering should be attended to carefully, no excess being allowed. *H.*

THE APIARY.

TECHNICAL LECTURES ON BEE-KEEPING.

IN connection with the Technical Education movement, the following syllabus has been drawn up by the British Bee-keepers' Association, and is suggested for the use of lecturers:—

SECTION I.—NATURAL HISTORY OF BEES.

1. The three constituents of the bee community.
2. Some leading features of the development and physiology of each of these, and the functions of the special organs of each.
3. The habits and offices of queens, drones, and workers, respectively.
4. Their dwellings (1) in Nature; (2) under domestication.
5. Their products: honey, wax, bee-bread, and propolis.
6. Swarms—natural and artificial.

SECTION II.—ESTABLISHMENT OF AN APIARY.

1. Installation in favourable locality as regards wind, rain, abundance of honey-yielding plants, &c.
2. Choice of various races of bees—black, Ligurian, Carniolan, &c.
3. Purchase of stocks or swarms, according to the season of the year.
4. Hives, skeps, moveable frames, supers, sections, &c.
5. Appliances of various kinds: smokers, feeders, veils, stoves, comb-foundation, &c.

SECTION III.—PRACTICAL APICULTURE.

1. Preparatory work: examination of stocks, securing their strength, &c.
2. Monthly operations in apiary.
3. Loss of queen's removal on account of age; queen rearing; introduction of young queens.
4. Diseases and enemies of bees; means of cure and protection.
5. Extracted honey; honey in sections and other supers.
6. Putting up honey in bottles and in section-cases.
7. Domestic and medicinal uses of honey; value of wax.
8. Relation of bees to flowers and to fruit crops.

The set of lantern-slides, specially photographed by Messrs. Newton & Co., are most suitable for use in connection with the above.

KEEPING HONEY.

Honey, especially that in the comb, should be kept in a warm and dry a temperature as possible. Sections deteriorate very quickly in a damp or cold place, and soon become unsaleable; whereas, if they are treated properly they retain their natural attractiveness, and may be kept from year to year without blemish. A complaint is often heard that honey is unsaleable except at low prices, the reason generally being that bee-keepers are in too great a hurry to sell their produce, and too much is crowded into the market at one time; whereas, if it were stored for a while, better prices might be realised. A cupboard next to a fire-place, to be found in most houses, is very suitable for keeping honey in, but sections require to be first put into glazed cases or wrapped up in tissue-paper, to exclude dust.

COVERINGS FOR BEES.

Hives with outer cases should be packed for winter with either sawdust, chaff, peat moss, &c., and those not so provided, require plenty of warm coverings over the tops of the frames. These may consist of several thicknesses of newspaper, woollen material of almost any description, or chaff, or feather cushions. The thick grey felt sold for putting under carpets is excellent stuff to use, as it is pliable, lasts a long time, and is cheap.

PROTECTION FROM WIND.

Hives in exposed places require to be fastened down to prevent them being blown over by winter gales. This may be effected by driving in a stake on each side of the hive, to which a rope is attached, after being passed over the top. In such positions it is almost imperative to have wind-breaks, to protect the bees as they fly in and out, as otherwise many get dashed to the ground and lost. Hedges of Holly, Yew, or Privet might be planted to overcome this difficulty, but in fixing the location for an apiary, it is better, if possible, to select a warm corner, protected by walls or buildings.

PLANTING FOR SPRING POLLEN.

A good supply of natural pollen early in the year is most helpful to bees in extending the brood nest, as large quantities are required for feeding the young ones. It does not pay bee-keepers to plant for honey, but it certainly does do so to plant for early pollen, especially if there is a dearth of early-flowering plants in close proximity to the apiary. The Crocus is one of the earliest and most useful of pollen-bearing flowers, and as the bulbs are cheap, may be planted in quantity. Wallflowers also yield a good supply of early pollen, as do the catkins of the Hazel and of the Willow (*Salix caprea*). *Expert.*

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By T. TUATON, Gardener, Maiden Erlegh, Reading.

PLANTING NEW ORCHARDS.—Land prepared last winter for planting as an orchard in the manner then recommended, and in the interval cropped with Potatoes, will now be in fine condition for tree planting. This operation should be carried out as soon as the trees can be obtained from the nursery, and no better time will offer than the present month, whilst some little warmth remains in the land. Under these conditions, the roots will make some little progress towards re-establishment before the arrival of spring. After planting the trees, stake them at once, so as to prevent wind-rocking, so destructive of the finer roots. If the stakes are made of stout Oak, Ash, or Hazel, charred and tarred at the ends, and for 1 foot above the soil, they will last for as long as the trees will stand in need of support. Before fastening the trees, place a piece of garden hose split on one side, round the stem; or, failing that, a bunch of straw or matting will answer almost as well, if placed between stake and stem. Unless the orchard is sheltered from the south-west, the stakes should be put in on this side, with a slight inclination in the same direction, the strong westerly winds preventing them growing over on that side.

DISTANCES AT WHICH TO PLANT, ETC.—For Apples, and especially for such varieties as Blenheim Pippin, Wellington, Beauty of Kent, Striped Beaufin, Kentish Filbasket, Brabant Belle-Bour, Rymer, Annie Elizabeth, Cox's Orange and Cockle Pippins, Claygate Pearmain, &c., which attain to large size, and which are specially suitable for orchard planting, a distance of 36 feet apart each way is not too great, and in no case should they be planted at a less distance than 30 feet, unless some early-bearing varieties, which may be, and usually are, of smaller dimensions, planted alternately with them, when 24 feet will suffice. A space of 24 feet is suitable for Pear, Plum, and Damson trees, these being of less spread of crown than Apples.

CHERRIES ON WALLS, MORELLOS.—Trained Morellos usually being planted on north walls, advantage should be taken of mild weather to get them pruned and nailed, which is preferable to leaving them till the spring. It is now much safer to apply dressings of sufficient strength to destroy aphids, red-spider, &c., than in the late winter months. Pruning will consist chiefly of cutting out as many of the naked shoots as there are young shoots to replace them, the object being to keep the tree furnished throughout with bearing-wood, but not to unduly crowd it. If the syringing of the trees earlier in the autumn with an insecticide was omitted, this may now be done after pruning and nailing, and for this purpose Gishurst Compound Soap at the rate of 2 oz. to 1 gallon of water, and one wine-glassful of petroleum added to every 3 gallons of the soap-suds is an efficient dressing. It should be kept well mixed while being used.

SWEET CHERRIES.—These varieties of Cherry, although usually grown on warmer aspects than

Morellos, may also be taken in hand at the same time, the men being employed on these when it is too cold to do anything to the Morello Cherries. Where summer-pruning received due attention, little in this way will now be required beyond the shortening back of the leading young shoots, and the same kind of insecticide as that used on the Morello will suit these; but if brown-scale is present on the shoots, a half-worn painter's brush should be employed as well as the syringe.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

RESTING AND WATERING ORCHIDS.—During the next three months, when the outside temperature will be at its lowest, and the quantity of sunlight the most meagre, high temperatures in the houses should be avoided as much as possible at night, so as to keep plants going to rest or actually at rest—quiescent, and in a fit condition to make a strong start at the proper season. It often happens that the dreaded spot is observed first on plants which have been rendered weakly and fragile by high night warmth, another reason for maintaining the plants at rest. Damping down is another matter that will need to be carefully done. The last day of October brought hard frost in Cheshire, our thermometer registering 13° below freezing-point—a sudden change indeed. The consequence was, that the warmth in the houses fell considerably, and the damping-down was prudently deferred for an hour or more, till such time as the temperature in the houses had risen a few degrees. Should bright weather prevail by day, the cool and intermediate-houses should be damped at 2 P.M., as well as in the early morning, but in cases of more than the usual fire-heat being employed, there must be more damping-down practised, otherwise yellow and black thrips will rapidly increase in numbers. The rule with regard to the matter is to damp the different houses as early in the mornings as it is safe so to do, allowing them to become dry in the middle of the day; and on days when the outside temperature is low let damping be again done early in the afternoons, the East Indian-house getting a little more moisture than any other.

RESTING OF ORCHIDS is an operation which must be practised with judgment, and this includes the affording water, damping, and airing. When the pseudobulbs shrivel, it is a sign that the plant should have water afforded, for I cannot believe in the practice of withholding water to so great an extent, but a plant should be brought to a state of rest by a gradual withholding of water at the roots and in the air, also hardening off the plants as they finish growing. *Phalenopsis*, *Aerides*, *Saccolabium*, *Vandas*, and *Cypripedium* will require a little more moisture than other species, as dryness with those soon causes injury in the shrinking of the leaves and in other ways, besides tending to increase insects. A moderate amount of air must be admitted on all favourable occasions; in fact, it is much better to leave air at night if bottom-ventilators are provided, varying these according to the direction of the wind, and if the warmth is at all low in the morning, let the amount of air admitted be reduced till such time as a rise takes place; but it is better for the air of the house to be a few degrees too low with air on, than a few too high with a close and dry atmosphere. In resting *Dendrobium*, water should be afforded at intervals of ten days or a fortnight, until such time as the buds on each node can be seen, and afterwards, once in three weeks will suffice. It should be borne in mind that, in taking *Dendrobium* from growing quarters to the resting-house, that they have not quite finished for another season, the pseudobulbs having still to be built up if a good return in flowers is looked for, and such plant must not be punished by lack of water before the flower-buds are set.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

CONSERVATORY ARRANGEMENT AND MANAGEMENT.—Considerable attention will now be required to make this department attractive with plants and flowers. Up to October 30, when 10° of frost was registered, the glorious display of double and single Dahlias, and many other hardy autumn flowers in the open borders untouched by frost and fog, drew attention away from indoor flowers. I never remember to have seen Dahlias of such size and colour so late in the season; now all have gone, and the flowers in the glasshouses are eagerly sought after.

The past season was one of the best ever known for plants under glass, and the promise for the winter is a good one. Where the conservatory is attached to the mansion, a small re-arrangement should take place at intervals of a week or ten days, so as to give change and freshness to the house. Formality in the arrangement of groups and banks of plants and flowers should be avoided by a judicious use of large and small Palms, Ferns, and other graceful foliage plants, and a plentiful use of the hardy Bamboo should be made. A stand or table of rather dull looking but much appreciated sweet-scented Pelargoniums is much improved by placing Callas in bloom amongst them. *Primula sinensis*, and *P. obconica* should have small plants of *Kentias* and *Dracæna indivisa* dotted in with them. With *Hyacinths* and *Narcissus*, Maidenhair Ferns associate well. *Chrysanthemums* in masses are much improved by a background of green foliage-plants, and a front margin of Ferns or *Selaginella* to hide the pots; and *Chrysanthemum* plants should be often changed about to vary the colourings of the groups. *Taxsonias*, *Bigonias*, *Fassifloras*, *Roses*, and other climbing plants, should be carefully gone over, removing all unsightly or decaying leaves or shoots, seeing also that the roots do not get too dry. All evergreen plants require to be kept moist at the roots. *Roses*, *William Allan Richardson* and *Rôve d'Or*, are excellent varieties for planting-out in a large conservatory, as if the shoots are kept thin, and allowed to ramble as they like, they are continually in flower. *Lapsgerias* should be kept rather dry at the root during the winter months, and care taken to keep snails away from growing shoots. If the plants are in pots, it is a good plan to have shallow cast-iron pans filled with water, and stand the plants over them on flower-pots or blocks of wood; and when planted-out in borders, a ring of pepper formed round the stems at some distance from them, is a good deterrent. *Luculia gratissima*, either in pots or planted out, will be benefited with a liberal supply of liquid manure, and by being kept clear of green-fly. An east or west wall in a warm conservatory is a good place for this fine winter-flowering plant. The sweet-flowering *Olea fragrans* grows and flowers well if planted against a south wall in this house; it is very useful for button-hole bouquets. *Hogiera gratissima*, grown in pots, is most useful for conservatory decoration and cutting purposes; and *R. cordata* makes a fine decorative plant for a wall or pillar. *Daphne indica* and *D. rubra* in pots, or planted out, must have good attention, not crowding them with other plants, and taking great care not to injure the stems of the plants when cleaning the house, but protecting them with stakes when there is danger of injury occurring. *Rhododendrons* in pots or tubs should have a plentiful supply of water, and the drainage of the tubs seen to that it is in good order. For thrips, syringe over the foliage with lemon-oil mixture. Orange trees will not require much water during the dark days if kept in a cool house, but they must not be kept dry, and the foliage must be maintained in health. *Heliotropes* growing and in flower will require a good supply of water, and to be kept clean by fumigation. Varieties of *Camellia* in flower at the present time are *alba plena*, *fimbriata*, *Donkelaari*, *Bononiensis*, *imbricata*, *Lady Hume's Blush*, and the old single white, still one of the best. I never saw *Camellias* in such fine health and so full of bud as they are this autumn. The temperature of the conservatory should now range from 45° to 50° by night, 55° to 60° by day. Abundance of air must be afforded when the weather is mild, but during cold weather it is best to let in air by the side ventilators that are near the hot-water pipes.

THE FLOWER GARDEN.

By T. H. CRASP.

CHRYSANTHEMUMS IN THE OPEN AIR.—These plants, owing to the mild weather, are flowering splendidly, and if some little trouble is spent in protecting those on walls and fences from frost, by means of tiffany, bast, mats, frigi-domo, &c., the display will last until we get hard frosts. Clumps and standards may have some Laurel branches placed around them at night.

LILIES.—If Lily bulbs are to be planted this year, there should be no further delay in so doing. I prefer to plant all bulbs of Lilies in the open ground at this season, for if they are left till the spring, the results are not so good, for the reason that as a rule the bulbs form new roots during the winter and early spring months, which enables the growth to start with vigour. Varieties such as *L.*

longiflorum var. *Harrisii*, *L. longiflorum*, *L. auratum*, *L. speciosum*, and its varieties, *L. pyrenaicum*, and *L. Martagon*, succeed in the open ground, provided the roots have good drainage beneath them, and there is a sufficient depth of peat and loam into which the roots can penetrate. Lilies should be deep enough to be out of the reach of frost. The Liliums named above have an effective look in bloom when they are planted between *Rhododendrons*, *Azaleas*, *Kalmias*, &c., provided they are not planted too thickly together. It is a good plan when the potting of the stock of Lilies is in hand, to plant the small bulbs and bulbils in the beds to increase in size, even should they form no flowers the first year.

HOLLYHOCKS may at this season be propagated from eyes, provided a bed with a brisk bottom-heat is at command, and into which the cutting-pots can be plunged. Buds may be taken from the crown of the plant with a portion of the bark, and inserted one or two in 48-sized pots, in sandy loam and leaf-mould, not too much of the latter; or they may be put singly into large 60's.

PAMPAS-GRASS.—This plant is easily increased by division of the root-stock, and the present season is a very suitable one for the operation. Pampas-grass does not succeed for a great length of time in shallow or gravelly soils, and in making new stations for the plant, the soil, if shallow or poor, should be dug to the depth of 2 feet or more, filling in with an equal quantity of rich loamy soil. In planting, it is advisable to make a basin round the plant for convenience of watering in the summer-time, the Pampas-grass not succeeding if the roots are not afforded water in abundance. Should the winter prove very severe, the grass should be tied together in an upright position, and a mat or piece of stout canvas wrapped round it. It may not generally be known that the plumes are greatly improved in appearance after cutting them in the early autumn, by holding them in front of the fire, and gently shaking them. All half-hardy herbaceous, perennial shrubs, climbers, &c., should be protected by placing mats, a slight thatching of straw, Asparagus tops, and in some conspicuous parts covering these materials neatly with common Laurel boughs, neatly and compactly. It is not prudent to delay much longer affording protection. The root-stocks of half-hardy plants, and bulbs of doubtful hardiness, may be protected with little heaps formed round or above them, of half-decayed leaf-mould, fine coal-ashes, or cocoa-fibre refuse.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

EARLY POT VINES.—The simple methods of growing Vines in pots for the supplying of Grapes at the earliest period possible, viz., March and April, will always find favour with those whose glass accommodation is of limited extent. The Vines may be started in pits or frames, or almost any kind of structure where a moist heat of 50° to 55° can be maintained, and in these they may be kept till the buds are swelling. A bottom-heat not more than 60° is of service when the Vines are started, thus forcing the roots simultaneously with the buds. These early-fruited Vines should have thoroughly ripened wood, have been well rested, be provided with good drainage, and be made quite clean before they are put into warmth. From the first the Vines should be lightly dewed over several times a day till the buds burst; but in frames or pits with tree leaves or sweetened manure, less syringing is required, a too moist atmosphere being unfavourable to healthy growth. The rods may be turned down or coiled, not closely, and kept thus till the buds move from bottom to top, then put in the position they are to maintain. I have had good Hamburg Grapes from pot Vines in the month of April, which were trained round five stakes, and grown on shelves where they were exposed to the sun, heat being supplied by means of hot-water pipes. To these Vines the water supplied was never less than 75° to 80°, and equally warm weak liquid manure was afforded bi-weekly, and oftener when the fruit was swelling, but no manure was afforded after the Grapes began to colour. In early forcing it is wisest to store the sunheat in preference to using fire-heat, and 10° rise in the temperature by sun-heat is a fair increase.

PEACHES.—When fruit is not required before the month of May, there is more certainty in having a good crop than when forcing is begun earlier than December 1; in the meanwhile the trees, houses,

and all surfaces should be rendered clean, and the preparations duly made. The borders, after being surfaced with rich loam, should be thoroughly watered. The forcing must be slow at first, and will consist of merely shutting the houses and allowing the temperature to rise above 45° if possible without fire-heat at night, and syringing with tepid water is suitable.

STRAWBERRIES.—The season has arrived when the Strawberry plants in pots should be in some way protected from frost, and this season they should be easily kept, the crowns, roots, and foliage being well-matured. The plants for the earlier fruits, say from the end of February and in March, are better if the pots are not more than 5 inches in diameter, and not deluged by rain, or deprived of free air and light. The start may be made early in December. If an orchard-house exists, this is a capital place in which to store Strawberry plants. Placing the plants on their sides, against a south and west wall, is a favourite method with some, the pots being packed into bracken or litter, and this has to be removed from time to time to ascertain the condition of the soil. Stacking the plants on their sides, bottom to bottom, in heaps, or ridges about 1 yard high, finds favour with many. The crowns by this method are readily protected by means of litter, in very severe frosts. For the last ten years I have plunged the pots to the rims in ashes or dry litter (sometimes leaves mixed with dry litter), with a good degree of success. If frozen when wanted for forcing, they are taken to a late Peach-house, and kept there till thawed, but during mild weather they are cleared of drainage, surfaced, &c., and removed direct to Peach-houses, vineries, or other structures at work. Last year the frost was unusually severe, but I never had less to complain of the roots and crowns being preserved in excellent condition.

MELONS.—It is believed by some, that fine-flavoured Melons cannot be obtained during November and December, but if such sorts as *Blenheim Orange* (true), *La Favorite*, and *Beechwood* are grown with healthy foliage, till they are well swelled, with a somewhat dry atmosphere towards the last, they may be cut green, kept cool and dry, and ripened in heat as required.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

BROAD BEANS.—A piece of ground should be cleared for making the first sowing of these; and it is a good practice to dig the land and sow it as the digging proceeds, especially if it be heavy, or the surface sticky. For early use, I sow the *Mazagan* and the *Long Pod* varieties, and the seed is put in rather thickly in drills made 3 feet apart, the plants being thinned out to the required distance in February, and the thinnings transplanted to give a succession. From the 15th to the 20th inst. is found in our county (Sussex) a suitable period for sowing.

EARLY PEAS.—It is not the general practice to sow these in the autumn, but where glass accommodation is scarce, and early dishes of Peas are expected, it is worth while to make a good large sowing, even should the frost destroy the plants. On dry, warm soil, the plants do not suffer so much as on retentive cold soils, and those who have the former may sow with every chance of success. The round white varieties of Peas are not so much in demand as they were in former years, but they stand the cold and moisture of winter better than wrinkled kinds, and are for that reason best for the first—or rather, latest sowings. We have tested a great number of kinds, and have come to the conclusion that it is better to wait a few days, and have those of a better quality, than to grow the hard white varieties. With us last season, *Exonian*, *Chelsea Gem*, and *Sutton's Early Marrow* were the best, and I shall grow them again. The same remarks apply to sowing Peas as to Broad Beans. The former variety, however (*Exonian*), grows 4 feet high, and should be sown 3 feet apart, the latter 2 feet, so that the same distance between the rows will be sufficient. Peas in frames will now require much attention, for during the dull months they are subject to the attacks of mildew, and a sharp look-out must be kept for this troublesome pest; for should it spread, the crop will be greatly injured, if not quite spoiled. If it be observed, at once dust with flowers-of-sulphur. Cover the lights at night, to ward off frost and snow, and ventilate freely on all favourable occasions. Snails and mice are troublesome at times, and must be trapped.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

		Croydon Chrysanthemum (two days). In our previous announcement of this Show in the <i>Gardeners' Chronicle</i> , the original dates selected for the Show were given.
TUESDAY,	Nov. 14	Plymouth and West of England Chrysanthemum (two days). Rathmore and Pembroke Chrysanthemum. Manchester Chrysanthemum (two days). Beckenham Horticultural and Chrysanthemum. Twickenham Horticultural and Chrysanthemum (two days). Hereford Fruit and Chrysanthemum (three days). Reading Chrysanthemum. Rugby and District Chrysanthemum (two days). Birmingham Chrysanthemum (two days). Winchester Chrysanthemum (two days). York Chrysanthemum (three days). South Shields Chrysanthemum (two days). Bristol Chrysanthemum (two days). Stirling Chrysanthemum (two days).
WEDNESDAY,	Nov. 15	Lincoln Chrysanthemum. Scottish Horticultural and Chrysanthemum (three days). Bolton (Lancs.) Chrysanthemum (two days). Sheffield Chrysanthemum (two days). Cumberland Chrysanthemum. Stockport Chrysanthemum (two days).
THURSDAY,	Nov. 16	
FRIDAY,	Nov. 17	

MEETINGS.

TUESDAY,	Nov. 14	Royal Horticultural Society's Committees, at the Drill Hall, James Street, Westminster. Horticultural Club, National Rose Society.

SALES.

MONDAY,	Nov. 13	Important two days' Clearance Sale of beautifully-grown Nursery Stock, at the Nurseries, Uxbridge, by order of Mr. Charles Turner, by Protheroe & Morris. Dutch Bulbs, at Protheroe & Morris' Rooms. Plants from Belgium, &c., at Protheroe & Morris' Rooms. Dutch Bulbs, at Stevens' Rooms. Bulbs, at Protheroe & Morris' Rooms. Special Sale of 100 Hardy Plants and Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	Nov. 14	Important Four Days' Clearance Sale of Nursery Stock, at the Lea Bridge Road Nurseries, Leyton, by order of Mr. John Fraser, by Protheroe & Morris. Dutch Bulbs, at Protheroe & Morris' Rooms. Plants, at Orchard Court, Stevenage, by order of J. Haden, by Protheroe & Morris. Dutch Bulbs, at Stevens' Rooms. Roses, Plants, Shrubs, &c., at Stevens' Rooms. Bulbs, at Protheroe & Morris' Rooms. Plants, <i>Lilium auratum</i> , and others, from Japan, &c., at Protheroe & Morris' Rooms.
THURSDAY,	Nov. 16	Clearance Sale of well-grown Stove and Greenhouse Plants, at Oakfield, Poynton Road, Clepham Park, by order of Sir George Lamson, by Protheroe & Morris. Orchids in Flower, Dutch Bulbs, &c., at Stevens' Rooms. Orchids, at Protheroe & Morris' Rooms.
FRIDAY,	Nov. 17	Dutch Bulbs, at Protheroe & Morris' Rooms.
SATURDAY,	Nov. 18	Dutch Bulbs, at Protheroe & Morris' Rooms. Dutch Bulbs, at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—42° 2.

The National Chrysanthemum Society. This week has seen the apotheosis of the national flower of Japan in this country, for not only have we to record exhibitions of the finest of autumn flowers at numerous places in the country, but

the best one in the South, that of the National Chrysanthemum Society. Naturally, gardeners and nurserymen who largely deal in and look on the Chrysanthemum as an article of commerce, look on the show held at the Royal Aquarium, Westminster, as being one at which the latest novelty, be it seedling or sport, may be found, if not at its best, still in presentable condition. As visitors to the show, but belonging to neither class, we will endeavour to afford our readers a survey of the whole from the standpoint of the man in the street and the horticultural critic. First, then, we must be grateful for the handsome bouquets of Japanese Chrysanthemums, large-flowered and vigorous, and cut with great length of stem which allowed them to fall negligently about, forming a pleasant contrast to the skimpy, "large" and small-flowered Pompons which stood close by in trim triplets of bloom. There was a bold extravagance about the idea of cutting off the Jap's head at the foot, instead of showing him off, as it were, a Daisy on a lawn. Another improvement noticed was the increased size of the showboards in the case of some of the exhibitors, some few having erred by showing too much painted board, a fact which some of the beholders averred had the effect of apparently lessening the size of the blooms.

Bouquets, in which the Chrysanthemum played a chief part, were well shown in a room apart from the main exhibition, thereby gaining in effectiveness. The various devices were, in the majority of examples, lightly carried out, and pleasant objects to look upon, with the exception perhaps of a small lyre, which was decidedly artificial in arrangement. In the groups of large-flowered varieties shown in pots, there seemed to be a long-desired improvement visible—the plants were less tall, less formal, furnished with visible healthy foliage, a horticultural feat of some weight this hot and droughty season, when every drop of water that the plants received came to them by means of the watering-pot. In this class, as in most of the others, new men are entering as competitors, and the new men very generally run the old ones close for the highest honour, and sometimes excel them, as in the case of Mr. JONES, of Hither Green.

There were few groups on this occasion, which, considering the cramped space afforded was not a disadvantage so far as the onlooker is concerned, as it admitted of the groups being observed from points at a little distance, instead of quite close, as at former shows. What can we say of the trained plants? So long as the powers that be admit them, they will be shown, and the public will admire them. As examples of patient, if perverted skill, they were this year finer than we have ever seen them, and so well flowered, and furnished with plenty of healthy foliage were they, that we cannot but praise them, and are fain to confess that the beautiful examples shown by Mr. D. DONALD and others, of *Triumphante*, *Gloriosum*, *Madame Rendatler*, *L'île des Plaisirs*, *Stanstead Surprise*, &c., went far to disarm criticism.

The cut flowers of Chrysanthemums may have been slightly fewer than in some recent years, and in the case of the incurved and large-flowered Anemones, rather smaller than we are accustomed to find them at these shows, but in finish and brilliancy of colouring, there was nothing left to be desired either in these or the Japanese varieties. Many novelties were seen for the first time, at their best, some of which will, as time goes on, drive older varieties out of the field. The metropolitan classes, we were glad to note, were fairly well filled with very creditable productions.

Chrysanthemum Growers' Terms. THE terminology made use of by the Chrysanthemum grower, affords a marked instance of the tendency of specialists to break away from general rules, and to adopt a code of their own. One convention is as good as another, and custom asserts its rule beyond the reach of law. It is necessary in these days of technical instruction to remember this matter, for scholars are likely to be taught according to one convention, whilst practitioners make use of the other. Among botanists and teachers a terminal bud is one which is placed at the terminus or end of the stem. Thus in the Chrysanthemum, the bud at the end of the stem is the terminal one, and we may indicate its position thus $2^1 3$. Buds 2 and 3 being lateral buds formed subsequently to No. 1. The terminal bud is terminal in position, but it is earlier in point of formation than those which are produced below it. The direction of growth in this case is from above downwards.

Chrysanthemum growers use the same word in reference to time, not to position. For them the terminal is the last bud formed, not the first. We fear it is too late to offer the suggestion with any hope of its acceptance, but if the word "final" could be substituted for terminal, it would tend to obviate the present confusion. The expression, "taking the bud" is another rather Hibernian phrase, inasmuch as it refers to the retention of the desired bud, and the taking away of those which are not desired.

The Individuality of Buds. THE selection of certain buds, the removal of others, and the time at which this operation is performed, are matters of the utmost importance to the cultivator of exhibition specimens. They are not less interesting to the physiologist, ever on the look-out to investigate the causes of variation. Surprise is often expressed at these variations, but surely the surprise would be more justifiable if there were no variations. We do not look for fully-developed manliness from a child, nor do we expect childishness in a man. Is it, then, wonderful that at one time when the plant's energy is chiefly expended in growth, the buds should be of a different character from what they are when the plant is mainly exercised in the process of development, and perhaps of reproduction?

So, too, with respect to sporting; although the details of the process elude us, and the causes which set it in action are as yet purely conjectural, the general principle is fairly obvious. Chrysanthemums have been crossed and re-crossed from time immemorial, but now and then, from causes unknown to us, a separation of the previously mixed elements takes place, and the result is a sport. The process may roughly be likened, for illustration sake, to a mixture in water of some insoluble substance, say, magnesia; shake the bottle, and keep it shaken, the mixture retains its uniform appearance. Cease to shake it, let the sediment settle, and the mixture divides into a clear portion at the top, and a turbid mass beneath. This change is brought about simply by mechanical separation. Very possibly in the case of sports some chemical changes also are in action. Again, it must be remembered that the change which seems superficially so great is really trifling. Microscopic examination shows usually little or no change of structure, but only a little more or a little less colouring matter, whilst the mere superposition of two cells containing different coloured fluids produces very great differences in appearance with a minimum of alteration in structure, or perhaps none at all.

LIATRIS SCARIOSA, WILLDENOW (fig. 95).—The handsome Composite represented in the accompanying illustration, is a showy, hardy, herbaceous perennial, growing 2 to 3 feet in height, with lanceolate or linear-lanceolate leaves, and an erect stout raceme of several flower-heads about an inch in

authorised garden name, of which it might be interesting to learn the origin. It has perhaps been given because it differs from the form that is more usually cultivated as *L. scariosa*, in having larger heads on longer peduncles, and the involucrel scales comparatively narrower and more taper-

also, in his *Gardeners' Dictionary*, describes the heads as having long peduncles; in what is perhaps the more usual form, the peduncles are shorter, and the involucrel scales have dilated and very obtusely-rounded tips. SWAZZ has figured this long-peduncled form in his *British Flower Garden*, 1st ser., vol. i., pl. 44.

FIG. 95.—LIATRIS SCARIOSA. FLOWERS BRIGHT PURPLE.
From a specimen forwarded by Mr. Smith, Daisy Hill Nurseries, Newry

diameter, of a bright and beautiful purple colour, on peduncles an inch and a-half or more long. It is a native of the Atlantic States of North America, and although introduced into cultivation more than 150 years ago, is by no means so often seen as it deserves to be. Recently it has been brought to our notice under the name of *L. callilepis*, but this seems to be purely an un-

pointed. But the American botanists state that *L. scariosa* is a very variable plant, and do not separate this form as a variety. Indeed, it would appear that it is the typical form of the species, since LINDLEY states under t. 1. of the *Botanical Register*, where the plant was figured in 1-21, that it agrees with the original specimen in the Claytonian Herbarium, on which the species is founded. MILLER,

under the erroneous name of *L. squarrosa*, a perfectly distinct species. The plant is well worthy of being more frequently cultivated, and those who do not know it would do well to become acquainted with its merits. N. E. BRON.

ROYAL HORTICULTURAL SOCIETY.—The next Fruit and Floral meeting will be held in the Drill

Hall, James Street, Victoria Street, Westminster, on Tuesday, November 14, when special prizes for Chrysanthemums will be offered. At 3 o'clock Mr. R. PARKER, F.R.H.S., will deliver a lecture on "Chrysanthemums."

NEW PLANTS AT THE L'HORTICULTURE INTERNATIONALE.—At a recent visit to this establishment, we were conducted by M. LUCIEN LINDEN through several houses devoted to the reception and cultivation of novelties which are not shown to the casual visitor. In the first place we may mention the show-house, where were nearly a thousand blooms of *Cattleya labiata autumnalis* (syn. *Warocqueana*) (fig. 96, p. 585, and fig. 99, p. 595), intermixed with those of the beautiful *Oncidium Gravesianum*, *crispum*, *Rogersi*, and *incurvum*. We noticed a *Cattleya aurea* remarkable for the unusual size and beauty of the lip; it is velvety, deep amethyst, with broad well-marked stripes of gold, and showing up well against the ground colour of this handsome flower. In the former *Nepenthes*-house are now displayed many novelties cultivated in the smaller houses. In the middle is a central tank full of water above some stages, in which are placed small Tree Ferns and many Aroids. These Ferns are very attractive. The stems are from 1½ to 2½ feet high, some as thick as a little finger, others twice that size, and they are surmounted with beautiful or singular crowns of foliage. These choice little Tree Ferns are most graceful. For table decoration nothing could be more elegant than a flat vase decked with foliage or flowers, from the centre of which rises a slender shaft surmounted by graceful fronds. There are at least twenty varieties of these Ferns; they are probably mostly varieties of *Cyathea*. Their exact determination when they have assumed their character will be very interesting. About thirty sorts of Aroids such as *Anthurium*, *Philodendron*, *Philodanum*, *Phrynium*, &c., are of great interest, their foliage is more decorative than any hitherto known. In this fine house and in some of the small ones, we met with ten new Palms, *Geonoma*, *Calamus*, *Kentia*, *Pinanga*, *Thrinax*, &c., many of these novelties will be much appreciated now when plant-lovers are getting rather tired of so many *Phoenix*, *Kentia*, and *Areca*. We noted in passing a pretty old Orchid recently re-discovered, *Oncidium Schlimii*, and many hybrids of *Cattleya*, *Cypripedium*, *Odontoglossum*, *Dendrobium*, &c. Also many specimens of *Cattleya citrius* fertilised by the pollen of various *Cattleyas*, such as *rex*, *Alexandra*, *Mendeli*, *amethystoglossa*, *guttata*, *maxima*, &c. Four houses were filled with new introductions, both on and under the stages, in masses and as single specimens, some definitely adopted, others still on trial. Many of these pleased us by their elegant and curious foliage, or by the unusual colouring of the leaves. They include species of *Cynophyllum*, *Spherogyne*, *Bertolonia* (a very curious new type), *Panicourea*, *Aphelandra*, *Philodendron*, *Adiantum*, *Maranta*, *Dieffenbachia*, *Peperonia*, *Curmeria*, *Costus*, *Bigonia*, &c. We do not exaggerate in saying that there are at least 200 novelties, not including the Orchids introduced, but which have not yet bloomed. We noted one curious phenomenon, a new *Amaryllis*, with a large red flower, fertilised at the time of the Ghent quinquennial last April, by the pollen of *Hæmanthus Lindenii*, yielded seed which was sown on June 23, and now, October 23, the young plants are already 6 inches high. The inverse fecundation, that is to say, *Hæmanthus Lindenii* fertilised with the pollen of the *Amaryllis*, has at present yielded only green fruit. *Ch. de Bosschère*.

LINNEAN SOCIETY.—An evening meeting will be held, November 16, 1893, at 8 P.M., when the following papers will be read:—1, "Origin of Plant structure through self-adaptation to the environment exemplified by Desert and Xerophilous plants," by Rev. GEO. HENSLOW, F.L.S. 2, "Catalogue of the described *Neuroptera Odonata* (Dragon-flies) of Ceylon, with descriptions of new species," by W. F. KIRBY, F.L.S., &c.

THE FLORAL SKETCH BOOK.—The council of the Royal Horticultural Society have granted

special permission to Mr. JOHN WEATHERS, Assistant Secretary, to publish his plant sketches. Mr. WEATHERS proposes to publish under the above title five large drawings each month, of as many new, rare, or interesting plants. Each plant figured will be fully described, and historical and cultural notes will also be given. The first number will be ready by January 6, 1894, and the price will be 1s.

STOCK-TAKING: OCTOBER.—Not necessarily, because all conditions of commercial men were desirous of getting at the sum total of last month's trade in imports and exports, but for some reason or other the "returns" were delayed a day in their publication, and that boded well for trade. The imports are in excess of those for the same month last year by £629,611. In the face of a great "coal war," this may read an over-production in colonial and foreign lands, or a desire to realise. Whatever the cause, the result is as noted, and the increase is spread over eight out of twelve headings. The following is our usual extract from the "summary" table of imports of foreign and colonial merchandise for the month of October:—

IMPORTS.	1892.	1893.	Difference.
	£.	£.	£.
Total value for month	£24,726,858	£25,356,469	+629,611
§II.—(A.) Articles of food and drink—duty free	11,945,301	13,293,187	+1,297,886
B.)—do., dutiable	3,165,473	2,815,174	-350,299
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)... ..	4,444,693	3,347,040	-1,097,653
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	4,331,414	4,459,104	+127,690
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,335,731	1,416,887	+81,156
(B.)—Parcel Post ...	55,519	37,180	-18,339

Needless to say, these figures have a very cheering aspect, and the outlook for the winter months would be a good one, were there no shadow cast over the labour market; but more of this presently. We give now some interesting figures relating to the imports of fruits, roots, and vegetables during the month just finished, as follows:—

IMPORTS.	1892.	1893.	Difference.
Fruits, raw:—			
Apples bush	859,658	612,279	-247,379
Cherries "	1,184	12,362	+11,178
Plums "	72,776	107,715	+34,939
Grapes "	277,852	380,616	+102,764
Unenumerated "	78,671	71,076	-7,595
Onions "	563,528	595,496	+31,968
Potatoes cwt.	115,857	13,218	-102,639
Vegetables, unenumerated, raw ... value	£72,461	£69,164	-£3,297

It has been suggested that, in view of the low prices returned for consignments of home and foreign Apples, manufacturers of preserved fruits might with profit turn their attention to Apple jelly, which, "years out of mind," has been a favourite dish with both young and old. The hint may be of use, as may the other, that lessons at school on cookery in general might with great advantage include the making of this toothsome preserve. We pass on now to the

EXPORTS.

A small sum in arithmetic shows a total loss in traffic returns on some ten lines of railway during the past three months, as compared with the same period in last year, of nearly two millions sterling! This is due to the greatly diminished output, and consequent carriage of coal, and of manufactures intended for export abroad. Notwithstanding all this black-looking

prospect for dividends to shareholders, notwithstanding the way of setting forth enormous injury to home trade, hunger, and starvation, this building up of bad blood in the social system, the exports of British and Irish manufactures for October show a falling off to the extent of only £545,668, as compared with the same period last year. Surely the amount of energy stored up in our manufactures and shippers is wonderful. The news from South America is not reassuring, nor does that from Spain tend to buoyancy in the market; and add to this the war at home, the disarrangement of all kinds of manufactures, with a diminution of foreign trade of but little more than half a million—it must force itself upon the most obtuse individual that, with a clear social and political atmosphere, we, as a nation, are showing no signs of nearing a condition best described by the word *effete*. Just a word to shippers to Macedonia. Catalogues in English are of little use (with English weights and measures)—those who print them in French or Italian do business. There are long firms in Salonica as in London! It might pay Chambers of Commerce how to look up these gentry—our consular agents are ready to give information respecting such parasites on trade.

"BOTANICAL MAGAZINE."—The November number contains coloured illustrations and descriptions of the following plants:—

Sarcocolla sagittifolia, BAKER, t. 7322.—The magnificent herbaceous plant introduced into cultivation by M. ANDRÉ, and figured in our columns, 1893, vol. i., p. 355, fig. 50, and in the *Revue Horticole*, 1892, fig. 16.

Veronica Fairfieldii, t. 7323.—A shrubby species, with small, ovate, finely-toothed leaves, margined with red, and with terminal panicles of pale lilac flowers. It is supposed to be a hybrid, and was obtained through Dr. BALFOUR from New Zealand.

Allomorpha Griffithii, t. 7324.—A Melastomad from the Malay peninsula, with woody rootstock, stalked, cordate, ovate, strongly-ribbed leaves, purplish on the under surface. The small white flowers are borne in spike-like panicles at the end of long red cylindrical scapes. It is a very handsome stove plant, and was introduced from Penang by Mr. CURTIS.

Harpalinæ Brownii, Hook. f., t. 7325.—A curious Aroid from the Malay peninsula, with the habit of *A. maculatum*, but with cordate acute crenulate leaves. The flowers are borne on an erect spadix, and surrounded at the base by a white pointed spathe. The male flowers consist of peltate scales, with six or eight most minute anther-lobes. The female flower are placed at the lower end of the spadix within the tube of the spathe, and consists each of a single erect ovary.

Calceolaria andina, BENTHAM, t. 7326.—An under-shrub, with broadly-stalked, oblong, ovate, rugose leaves, and terminal panicles of yellow calceolate flowers. Native of the Chilean Andes. Kew.

"A NEW CHAPTER IN THE HISTORY OF LABOUR."—Mr. J. KEITH seems to desire to stand as the friend of working-men, as well as of their employers, and this pamphlet gives the outline of his plan for the benefit of both these classes, and also tells how well the experiment works when put to the proof. Mr. KEITH proposes an alteration in the hours of labour; that work in his engineering shops shall begin daily at 8 o'clock, after breakfast instead of before that meal, and that the Saturday half-holiday shall remain intact. He says that, "taking six days as the actual working-days of the week, these give 144 hours in all, which being divided by three, gives—forty-eight hours for work, forty-eight hours for sleep, and forty-eight hours for recreation, &c." This re-division of time is proved to be equally beneficial both to master and workman, and to necessitate no alteration in the scale of wages. Nothing save putting it in practice can really test such a plan as this, and the fact of its entire success as tried in the Scotch engineering trade, is a sufficient recommendation to English and other manufacturers to adopt it also where the conditions are such as to enable it to be carried out.

Mr. KEITH is known all the world over for the boilers, ventilators, hydraulic apparatus, &c., made, patented, and sent out, from his works in Arbroath. His boilers are remarkable for their great power, rapidity of action, and general efficiency.

A NOTE FROM SCILLY.—A curious instance of the influence of the hot summer we have passed through in upsetting the ordinary arrangements of Nature comes from the Isles of Scilly, observes a contributor to the *Pall Mall Gazette*. In more usual seasons the flower-growers there expect that the bulbs which have been planted in the open will begin to flower abundantly just when those which have been forced under glass are going off. This year, however, the common order has been reversed. The flower-farmers have hardly set their forcing-houses in order; yet, out-of-doors, in the fields shut in by Escallonia hedges, the flowers are abundant.

approved of by the council. Intending competitors should intimate such, in writing, to the hon. secretary, ROBERT LAIRD, 17, South Frederick Street, Edinburgh, at the beginning of the session, and not later than December 1. Syllabus:—

In Dowell's Rooms, 18, George Street.—November 22, Introductory Lecture, by Mr. M. Dunn, Dalkeith.

In Surgeon's Hall, Nicolson Street.—November 29, December 6, 13, 20, 27, "The Chemistry of the Vegetable Garden," illustrated by diagrams and experiments, by Mr. W. Ivason Macadam, F.R.S.E., F.I.C., F.C.S., &c.

In Dowell's Rooms, 18, George Street.—January 10, 17, and 24, "Physics as applied to the Vegetable Garden," by Mr. A. N. Macalpine, Consulting Botanist to the Highland and Agricultural Society.

In Minto House, Chambers Street.—January 31 and February 7, "The Chemistry of the Soils:

grow down into the grass, and spring up again as semi-independent trees.

THE SEASON AND THE WHEAT CROP.—The report with which we have been favoured by Sir JOHN LAWES (p. 587), is of more than ordinary interest, not only economically, but physiologically, and as such will be read with profit by all who have to cultivate plants under like conditions, and by those concerned in the study of plant-life generally.

KENT COUNTY COUNCIL.—We learn that Mr. W. P. WRIGHT, assisted by Mr. J. P. RIDING, will give a course of six weekly lectures at the Village Hall, Chislehurst, commencing on Monday, November 13, at 7.30 P.M. Mr. LEWIS WIGRAM is the local secretary, and the office of the secretary to the County Committee is at the Sessions House, Maidstone.

FIG. 99.—ORCHID HOUSE AT L'HORTICULTURE INTERNATIONALE, PARC LEOPOLD, BRUSSELS. (SEE P. 594)

They have been gathering Scilly Whites and S. deil d'Or for some weeks past, and the beautiful *Anemone fulgens* has also begun to flower. The ripe Strawberries lately gathered in wayside hedges would make one think July had returned; the untimely opening of flowers at Scilly might almost convince that winter was more than half over.

SCOTTISH HORTICULTURAL ASSOCIATION: TECHNICAL EDUCATION IN HORTICULTURE.—The Council of the Scottish Horticultural Association has arranged a course of lectures on the Vegetable Garden, to be delivered during the ensuing winter and spring. The scientific and practical aspects of the subjects chosen will be treated of by eminent authorities, and the lectures will be free to all interested in the advancement of horticulture. Prizes will be given to successful competitors, who must have attended three-fourths of the lectures, and must be under-gardeners or nurserymen, and

the Old and New Doctrines," by Dr. Hunter, Minto House.

In Dowell's Rooms, 18, George Street.—February 11, "Peas, Beans, Asparagus, Seakale, and Rhubarb," by Mr. A. H. Scott, The Gardens, Cambusdoon, Ayr; 21, "The Brassica and Allium tribes," by Mr. Williamson, Tarvit, Cupar-Fife; 28, "Root Crops," by Mr. Loney, Marchmont, Duns; March 7, "Mushrooms, Cucumbers, and Tomatoes," by Mr. P. W. Fairgrieve, Dunkeld; 14, "Salads," by Mr. Temple, Carron House, Falkirk.

The lectures will commence at 7.30 each evening.

HORSE-CHESTNUTS IN CAMBRIDGE.—It is understood that the authorities of Trinity Hall are about to cut off the branches of their Horse-Chestnut trees, which have been an interesting curiosity of tree life for the last half century, as well as very beautiful, simply because they take up a space in a bowling-green. The branches, which are very large,

THE WEATHER.—Writing from Sunny Hill, Llandudno, JOSEPH BROOME, Esq., High Sheriff of the county of Carnarvon, says:—"We are having grand weather, the sun shining like summer-time. Since March to this day (November 8), the temperature has been 15° to 20° higher than last year. To-day, for instance, 51°; same time and day last year, 32°.

THE HORTICULTURAL COLLEGE, SWANLEY, KENT.—The next meeting of the Experiments Committee will be held on Thursday, November 16, when Prof. CHESHIRE will lecture on the "Germination of Seeds."

THE MANNING TESTIMONIAL.—After a consultation with Mr. MANNING, with regard to the disposal of the fund subscribed for this object, it has been decided that the presentation shall take the form of a dining-room suite, with clock and orna-

ments to match. This will be accompanied with an illuminated address, containing also the names only of the donors. The completion is deferred until Mr. MANNING'S return from the country.

PUBLICATIONS RECEIVED.—*Cottage Gardening*, vol. ii., edited by W. ROBINSON (CASSELL & Co.).—*British Fungus Flora*, by GEORGE MASSEE (G. BELL & Sons).—*Le Galle nella Flora Italica*, DOTT. C. MASSALONGO (Verona, FRANCHINI).—*La Coca du Buysson* (Lyon, JACQUET).—*Ens Botanische Tropenreise*, Dr. HASEBLANDT (Leipzig, ENGELMANN).—*Die Botanische Garten "s" lands Plantentuin zu Buitenzorg auf Java* (Leipzig, ENGELMANN).

KEW NOTES.

CHRYSANTHEMUMS.—The Chrysanthemums in the Royal Gardens are worth a long journey to see, and the plants are arranged in the temperate-house and the greenhouse. They are shifted about twice, some varieties more than others, once when a few inches high, and in the early summer. They are certainly very beautiful, and far more satisfying to the eye than exhibition flowers or trained specimens. Some specimens bear literally hundreds of flowers, scarcely a leaf visible, and foliage to the base of the plants. Some kinds are better for this style of cultivation than others. Thus we were particularly struck with the beauty of *La Nympe*, a Japanese variety of a soft rose-purple colour, and delightfully free. *Tendresse* is a perfect gem, its flowers also of a rose-purple shade, the florets at the base of a yellow colour. *Hiver Fleur*, a variety one never sees now at the show, is very useful for growing in this form, and also worthy of note are *Avalanche*, *Eynsford White*, *Mdlle. Lacroix*, three fine whites; *James Salter*, *Lady Selborne*, *Sœur Melanie*, *Edwin Molyneux*, *F. Delaux*, *W. Holmes*, *Swanley Yellow*, *Bouquet Fait*, *Maiden's Blush*, and amongst singles *Miss Rose* and *Mary Anderson*. The former of the two is very good out-of-doors, and it is one of the finest of all Chrysanthemums, the flowers neat in shape and rose in colour; whilst those of *Mary Anderson* are white or nearly so, and with broader petals. The Chrysanthemums here are most creditable. *Visitor*.

HOME CORRESPONDENCE.

AMARYLLIS BELLADONNA.—Referring to the note of "E. M.," p. 554, permit me to emphasise my note, p. 468, as to the necessity of planting the bulbs at the base of the warmest south wall in the northern counties, if full success is expected. I happen to know that several people are planting bulbs this year, hence my anxiety on the point. Probably in the southern and south-western counties success may be had in fair seasons by planting them at the base of ordinary south walls. Can "E. M.," who knows the north, tell us of places (in the north) where full success is regularly secured without the care I allude to? *H. J. C. Grimston*.

ORCHID CULTURE IN BELGIUM AND IN ENGLAND.—I read M. Lucien Linden's opinion of Orchid cultivation in England, and English gardeners, as compared with Belgian methods and men, immediately on my return from a visit to Brussels, where I devoted nearly two days to an inspection of the nursery of L'Horticulture Internationale, of which M. Linden is director. Orchid cultivation is exceptionally successful in some parts of Belgium; and there are several gardens, of which that of M. Warocqué at Mariemont, M. Peeters of Brussels, and M. Linden's are examples, where the plants generally are better cultivated than in most gardens. But is M. Linden warranted in his conclusion that this success is due entirely to superior methods of culture? I think not. Anyone who has had an opportunity of observing horticultural art in different countries, or even in different parts of the same country, must admit that climatic and other conditions favour the cultivation of certain plants in one place more than in another. For instance, Azaleas and Camellias are grown far more successfully in some parts of Belgium than anywhere else. Messrs. Low & Co. adopted the Belgian system

for Azaleas, and employed Belgians to manage them, but the experiment was not a success, owing, no doubt, to climatic disadvantages. Or, to take a home example, would Cornish gardeners be justified in setting down entirely to their own skill their conspicuous success in the cultivation of Himalayan Rhododendrons, which grow and flourish like Laurels in some parts of that county? Climatic conditions again. Belgian gardeners in England have not shown any superiority as cultivators. It would not be difficult to find in Belgium large gardens where the cultivation of Orchids, as well as other plants, is not first-rate. Certainly the Orchids generally in M. Linden's establishment are splendidly grown. I have never seen such fine collections of *Odontoglossum*, *Maedevalias*, *Vandas*, and *Cattleyas* anywhere. I believe M. Linden himself is a very skilful cultivator and manager—that he has demonstrated in the Brussels establishment—but it is questionable if he would be more successful than our best cultivators if he transferred his plants and his staff to England, where the conditions as to climate, &c., are different. I contend that methods which succeed in England would probably fail in Belgium, and, of course, *vice-versa*. I know from experience this is so. Sometimes we get at Kew gardeners who have had conspicuous success in the cultivation of certain plants, and to test their methods they have been allowed to try the same methods for the same plants here, even to the extent of procuring the soil from the place where success was achieved. But it has never had good results. I think M. Linden must give some credit to favourable conditions as well as to superior cultural skill for the superb health of his collections. When he opens his branch establishment in England, which, I believe, he intends to do shortly, we shall then see how many points he will be able to give English cultivators. Comparing results, I question if anywhere one could find Orchids better flowered than they are in the best English collections, for instance, those of Burford Lodge, or The Dell, Egham; and the plants are not flowered to death either. Healthy growth, fine foliage, full pseudobulbs, are all very well, but there must be plenty of flower also, otherwise Leeks would do just as well. Whether a more liberal supply of air, light, and moisture would improve the health and vigour of the best English collections of Orchids, is a question easily put to the test. At St. Albans, I know, there is no stint of these requirements. Orchid cultivation, and indeed indoor gardening generally, has been much advanced within the last fifteen years in consequence of improved methods of ventilation and shading, and also in affording more moisture, especially during the growing season. Readers of this paper will be amused to see that M. Cahuzac, whose judgment is accepted by M. Linden, gives the Belgian gardener credit for more "zeal, attention to detail, thought, interest and taste," than the English, who is, however, credited with being a bigger swell and better educated. Our own prophets have always declared that we have abundance of practical knowledge, &c., but are shockingly wanting in education and manners! It may be insular prejudice or British brag, but after having seen and experienced a considerable amount of European gardening, I say that the English—of course, including Scotch—as cultivators of plants are equalled by few, and surpassed by none. Englishmen have the knack of fitting themselves to the requirements of a post as readily as any nationality, be the post that of gardener or archbishop. It is no compliment to an English gardener to tell him that he talks and dresses well, but is not master of his work. At the same time, we are ready to be taught, and a visit to the famous Brussels nursery is worth any gardener's while, though whether he will be able, by repeating here the practices of Belgian cultivators, to improve upon the most approved methods of English cultivators is, I am inclined to think, doubtful. *W. Watson*.

COSMOS BIPINNATUS.—This plant has succeeded well here this season, and has been a welcome addition to the flower-borders when many of the ordinary occupants suffered so much from the drought. Its finely divided foliage is very useful for mixing with cut flowers in bouquets, and branches of it when in flower blend well with Dahlias, and take off much of the stiff appearance of those flowers. I sowed the seeds on a gentle hot-bed in April, and planted out the seedlings in May as soon as danger from frost was supposed to be over for the season. The plant grows from 3 to 4 feet high, and almost as much in diameter. *W. H. Divers, Ketton Hall Gardens, Stamford*.

THE WEATHER.—On Tuesday morning, October 31, the thermometer on the grass at this place registered 21°, or 11° of frost, and in the Stevenson screen 29°, the first frost of the season. Dahlias, Heliotropes, Begonias, zonal Pelargoniums, Salvias, and many others which were in full flower were destroyed. It is quite unusual for autumn flowers to keep fresh to so late a date in this locality, we generally lose them all quite early in September. *W. H. Divers, Ketton Hall Gardens, Stamford*.

CHRYSANTHEMUM SHOWS AND THE GARDENERS' ORPHAN FUND.—The gratifying report in your last issue of the committee meeting of the Gardeners' Orphan Fund will, no doubt, stimulate many societies to imitate the good example set by the organisers of the Surbiton Concert. You will observe by the enclosed programme, that the Tonbridge Gardeners' and Amateurs' Association will, on the occasion of their Chrysanthemum and fruit show, 15th and 16th inst., devote a stall for the sale of articles to which the charitable public are invited to contribute, and the proceeds to be given in aid of the Gardeners' Orphan Fund. Your correspondent, "One of the Founders," very reasonably complains of the poor result attained by sending out the collecting cards. It may be somewhat mollifying to your correspondent to know that it is no doubt due to the cards being so industriously circulated by Mr. Barron in this neighbourhood, that the thought was bred, of which this effort on the part of our Society is the result, and I am sure our members and gardening friends around us will do their best to help. *F. Webber, The Nurseries, Tonbridge*.

SEASONABLE NOTES ON VIOLET CULTURE.—The production of double Violets for at least seven months of the year commencing early in September, is a simple matter to those who have the convenience and the practical knowledge of the cultural requirements of the plants [and who live in the country]. Still, in many gardens it cannot be said that Violets are successfully managed. Apart from the imperfect manner in which the plants are prepared for winter-flowering, the greatest mistake made by those in charge, is that of inducing, as it were, the plants to make new growth directly they are transferred to their flowering quarters, and to become established as it were. Instead of exposing the plants fully to the air for a time after they are put in the frames, the lights are very often placed over them at once, and but little air provided, under the delusion that they need encouragement to make new growth. If the plants have been properly prepared during the summer, they need no encouragement to make fresh leaves. To encourage root-action is all very well, but this is easily done, whilst leaf-growth is, as it were, at a standstill, and the flower-buds are the while receiving assistance from the roots—these well, but not the foliage. I never allow the lights to be put over the plants till there is danger of frost injuring them or much rain falling, and even then the lights are tilted both at the back and front of the frames. Abundance of air directly the thermometer out-of-doors stands a few degrees above freezing-point is what Violets require. *E. M.*

EPILOBIUM LATIFOLIUM.—I have the pleasure to inform "E. B. B." respecting *Epilobium latifolium* (Nov. 4, p. 568), that though I believe it is not much grown, it has existed here for many years. I wonder that a plant so free, distinct, and beautiful, should not have met with more acceptance. Visitors here have often been attracted by its beauties, but like many other things it suffers depreciation owing to its family relationship. The *Epilobiums* generally are not favourites, still the species which, as grown here, I am pleased to say is the true form, as verified by Trelease's recent monograph of the "North American species *Epilobium*." It is a dwarf plant with a big leaf, glaucous to almost a blue-green. The flowers are also very large, and of a pleasing colour, which mingling profusely with the glaucous foliage, scarcely any more than 6 inches high, render the plant a most acceptable one for rock-work purposes. It spreads freely by its roots, which may be described technically as knotty underground stems. In light soil it is liable to become tiresome, but properly placed, it is a plant capable of doing good service. Its hardiness, or want of hardiness, can be no reason why it is not more often met with. It is a native of damp places, in Arctic America from Labrador to Alaska. It would almost seem that it is a variable species—at any rate, from the examination of specimens from widely-varying habitats. *J. Wood, Plant Club Gardens, Kirkstall, Leeds*.

A WIREWORM TRAP.

THE wireworm is one of the most troublesome pests of the garden, and of all the nostrums recommended for its destruction, none is really effectual. Gas-lime, if used sufficiently strong to kill the wireworm, kills the plants. The only effectual way of dealing with them is to catch them. Messrs. Osman & Co., 132 and 134, Commercial Road, E., have introduced a most effectual trap in the form of a perforated cone, made of sheet-iron, into which a Carrot is inserted, and the cone thrust into the ground as in the accompanying illustration (fig. 100). I have tried a dozen of the traps during the past six weeks, and find that they quickly clear the ground of this enemy of Carnations. I am putting down two dozen more on some new ground I have broken up for Carnations. I saw the traps exhibited at the Agricultural Hall flower-show recently, and bought a dozen for trial; and I believe I am doing a public benefit in drawing attention to this little-known and useful article. J. Douglas.

SOCIETIES.

NATIONAL CHRYSANTHEMUM.

CHRYSANTHEMUMS were again exhibited in large quantity at the great annual show of the National Society, held in the Royal Aquarium, Westminster, on Tuesday, November 7, and two following days. Never was there a better exhibition in this

place. Cut blooms, on the whole, were excellent—the Japanese were really wonderful—and all the other sections were quite up to average, if we except the incurved, which, as we ventured to hint in our columns last week, were rather small and late. Plants in groups, and in trained specimens, were beyond everything. We wish we could congratulate the promoters on the arrangements of the classes, but, unfortunately, many of them were so mixed up, as to cause the greatest difficulty and inconvenience to the press. Part of this may be excused, owing to the character of the building, and to the pressure for space; but, in a measure, it might undoubtedly have been avoided.

THE SOCIETIES' COMPETITION.

This class never seems to excite the amount of interest it might be expected to do, and there are generally but three or four competitors. This year the stand that was awarded 1st prize, viz., The Challenge Trophy and £10, was of very good merit, and the Society that was able to contribute such may be proud of the fact, especially as they were successful last year. The Society so distinguished is the St. Neot's Amateur and Cottage Horticultural Society, Huntingdonshire, and the blooms shown were from the garden of J. Thornhill, Esq., Widdington, Huntingdon, gr. Mr. R. Petfield. In the collection of twenty-four Japanese blooms and twenty-four incurved, required by the schedule, the flowers of Mrs. Harman Payne, Waban, Eda Prass, Viviani Morel, Mr. E. C. Clarke, and Mr. Colea, all Japanese, were of more than usual excellence. The incurved, as was usual, were rather small.

The Havant Chrysanthemum Society was 2nd, a like position to that they held last year; 3rd, the Sittingbourne and Milton Gardeners' Association.

CUT BLOOMS.

Incurved.—Here was the only weak point in the exhibition; the flowers throughout were smaller than usual, and those which secured the 1st prize this week were not nearly equal to those shown by Messrs. W. and G. Drover in this class last season.

The most important class in this section was for thirty-six blooms distinct, the 1st prize being £10 and the Challenge Trophy. The best and most successful exhibitor was Mr. W. H. Lees, gr. to F. A. Bevan, Esq., Trent Park, New Barnet. Although there was no phenomenal difference between the several stands, this exhibitor was undoubtedly the best; the varieties were as follows:—Back row: Empress of India, Alfred Lyne, John Lambert, Violet Tomlin, Queen of England, Mons. R. Bannant, Mrs. R. King, Lord Wolseley, Alfred Salter, Princess of Wales, Lord Alcester, and Prince Alfred; central row: R. Cannell, Mrs. Coleman, John Salter, Miss

Haggas, Princess of Teck, Annie Hoste, Jeanne d'Arc, Lady Dorothy, Golden Empress of India, Hero of Stoke Newington, Barbara, and John Doughty; 3rd row: Madame Darrier, White Venus, Mrs. Halliburton, Empress Eugénie, Nil Desperandum, Princess Beatrice, Mrs. Heale, Charles Gibson, Mrs. N. Davis, Cherub, and Lord Eversley. 2nd, Messrs. W. and G. Drover, Fareham, Hants; the stand contained some neat blooms, but on the whole they were not so good as they ought to be. 3rd, Messrs. W. Ray & Co., Mount Pleasant Nursery, Teynham. 4th, Mr. H. Shoemith, gr. to M. Hodgson, Esq., Shirley Cottage, Croydon.

In the class for twenty-four blooms, the premier position was taken by Mr. W. H. Lees, with a very creditable collection. The best were Princess of Wales, Golden Empress of India, Princess Teck, and Empress Eugénie. Mr. C. W. Knowles, gr. to Chas. Egerton Solna, Esq., Roehampton, was 2nd, Messrs. W. Ray & Co., 3rd, and Mr. Jas. Myers, gr. to the Earl of Sandwich, Hinchbrook Gardens, Huntingdon, 4th. The next class in this section was for twelve blooms distinct, and Mr. W. Collins, gr. to J. W. Carlile, Esq., Ponsbourne Park, Hertford, was 1st, and showed remarkably well compared with the other classes. His blooms were, White Emperor, Mrs. R. King, Alfred Salter, Queen of England, Golden Emperor, Jno. Doughty, Mr. Heale, Madame

Hill, W. Falconer, Charles Shrimpton, Mrs. Alphens Hardy, Rufacto Marshaletta, Madame Thérèse Rey, Robert Owen, Louis Böhmer, Beauty of Exmouth, Vice-President Calvat, Autumn Tints, Gloire du Rocher, John Shrimpton, and Charles Blick; 2nd, Mr. Charles Cox, gr. to John Trotter, Esq., Brickendon, Hertford; 3rd, Mr. Charles Gibson, gr. to J. Wormald, Esq., Morden Park, Surrey; 4th, Messrs. W. and G. Drover.
